

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + Make non-commercial use of the files We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + Maintain attribution The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + Keep it legal Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

171, FLEET STREET.

TO OUR READERS.

- x -

At the commencement of another year we desire to acknowledge the aid r ndered to us by those contributors who have enabled us to maintain so well the popularity and usefulness of the *Journal of Horticulture*.

If during the year that is past our paper has refreshed any weary brain, has solaced the active man of business, has been the cherished companion of many a son of toil, has proved instructive and entertaining to the under gardener, and has been accepted as a welcome guest in the homes of those who have won their spurs in the field of horticulture, we are content—our work has not been fruitless.

There is something a little different between the editors and the subscribers of a horticultural journal from that of the majority of newspapers. They have to consider the interests of all kinds of readers, while we only have to think of those pursuits with which we are particularly identified, so that there is a mutual sympathy between us, an interest in one another's welfare, which we feel assured will not only continue but increase.

That the present year will be brighter and better than the last, that enmity (if any has a place amongst gardeners) will vanish, that old friendships will be cemented, and new, pleasant, and healthy associations made, and that horticulture may flourish, is the new year's wish of

THE EDITORS.

it travels better.

FORCING STRAWBERRIES IN POTS.

time of the year is more appropriate than the present for discussing the merits of the numerous varieties of Strawberries employed for this purpose and the most economical system of preparing the plants for forcing. The subject has been ably advanced by Mr. Taylor. We have tried the various plans of preparing the plants, by severing them from the parent plant and establishing them in cold

frames, also layering in small pots, and the one which has proved the most satisfactory is layering into the fruiting pots. It not only saves much time in potting, but a large amount of labour in watering. It is the most economical plan that can be adopted, and the plants are less liable to the attacks of red spider than when subject to the ordeal of drying two or three times a day,

as is the case when layered in small pots.

Your correspondent, Mr. H. C. Ogle, appears to cling to the old system of growing Strawberries, and must have, if he forces a large number of plants, plenty of cold pits at his disposal, more in fact than the majority of gardeners are favoured with; while he recommends the plants to remain in cool pits the whole of the season, which is altogether unnecessary—indeed it is a disadvantage rather than otherwise. So long as the plants grow freely, form well-ripened crowns, and produce fruit of first-rate quality, we should say, Do not trouble with the cold-frame system. In few places—very few indeed—could cold pits be given to Strawberries from eight to ten months of the year or more. Besides, the pits can be more profitably employed for various plant-growing purposes throughout the summer, and be utilised for other valuable purposes in winter and spring. Experience teaches us, especially after a winter like the past, that the placing of Strawberries in frames for protection even in winter is not needed, except in the case of those required to be forced early. with heat and moisture they soon show activity and throw up their flower spikes better than when kept in a semiactive state through the winter.

Again, we do not agree with saucers of water placed underneath the Strawberry pots; these and squares of turf or, what we have seen employed, shallow boxes filled, or partially filled, with soil, are used at the expense of the flavour of the fruit. It has been difficult enough during the present Strawberry season to keep the air of the house sufficiently dry to give good flavour instead of having water from the saucers and boxes employed constantly evaporating to the fruit. Turf placed under the pot is also batches have constantly to be removed to be brought forward faster or retarded, as the case may be. We have tried these systems in days gone by, and we obtain fruit as large

and possessing a better flavour without them.

The varieties that have been named are good. Vicomtesse Héricart de Thury is the only variety that will do well outside here. Sir Joseph Paxton we prefer to Keens' Seedling, but there is very little difference; we think

Some undoubtedly will be ready to say, Because of the number of seeds that are so prominent on the flesh, which are so objectionable to the Strawberry-eater; its travelling properties outbalance this objection. It travels better when packed than any variety with which we are acquainted. Dr. Hogg is a fine-flavoured variety for late purposes, the fruit is large and ripens up to a good colour. Another Strawberry which should be grown in every garden is. Underhill's Sir Harry. It is one of the most fruitful. Strawberries in existence; it is shy in making runners, and it takes a long time to obtain a stock from a limited number of plants. It promises well outside here when, as before noticed, all others fail, with the exception of Vicomtesse Héricart de Thury. As a second Strawberry it is excellent, and has a splendid flavour and colour, and as an autumn and winter fruiter it has no equal. fertility at that season of the year is something wonderful; Vicomtesse has no chance with it for colour or size of fruit. It is by no means difficult to have fruit of it from 4 to 5 inches in circumference in December or January Strawberries outside are much later than usual this year,

has Sir Charles Napier done to be left out of the list?

President is a grand variety.

and the batch of Vicomtesse Héricart de Thury that fruited early in the season, if the necessary attention has been paid to hardening-off the plants carefully before placing them outside, will now be showing signs of their flower spikes, and will come in well when those outside are done. If the flower spikes are advancing too rapidly the plants must be placed in a north aspect. This batch will set and ripen well outside. The later batches will be more productive than this early one. The plants should be partially shaken out and repotted. This operation should be carried out through the whole stock that is intended for autumn and winter fruiting; they can also be planted out in prepared borders and lifted when the flower spikes commence showing towards the end of August. Those plants established in pots did the best with us last year; although if lifted early from the planted-out system they will do very satisfactorily.—WILLIAM BARDNEY.

RUST AND BLOOM ON GRAPES.

RUST.—This is one of the greatest disfigurements which can affect Grapes. It may be known to every Grape-grower by the rough brown colour which marks and speckles the berries just about the time they are thinned. Some berries are nearly covered with it, like netting over the surface of a Melon, others are only spotted here and there; but in all cases it spoils the appearance of the berries. Many reasons for Grapes being rusted have been published from time to time; some right, no doubt, and others wrong. Draughts of cold air are said to produce it. I do not think so. Sulphur in the atmosphere, and rubbing or touching the berries with the head, are also said to favour its production, but I hardly credit this either. In my opinion the chief cause of rust on Grapes is carelessness in thinning. Anyone who has thinned Grapes will have observed that before one bunch has been finished the scissors have become

NO. 953.-YOL XXXVII., NEW SERIES.

quite damp, and if they are drawn through clean fingers or rubbed on clean paper they will leave a dirty black mark, and as there is nothing which will show dirt quicker than young Grapes I am quite satisfied that it is this which produces rust on Grapes. As Grapes are often thinned when the bunches are damp this increases the evil, and I would advise anyone who doubts this to be the cause of rust to try it on a bunch or two and see the result. To prevent rust those who thin Grapes cannot be too careful in keeping their scissors dry and clean, which can easily be done by wiping them frequently with a

cloth kept at hand for the purpose.

BLOOM.—On all kinds of Grapes, more especially those well developed, a good coating of bloom on the berries always adds greatly to their appearance; in fact good bloom on Grapes may be considered the crowning point of perfect culture, as no bunch of Grapes can be considered perfect if the bloom is rubbed or deficient; and Grapes otherwise well grown, but wanting in this, seldom take high honours at shows or any-where else: therefore all who aim at growing good Grapes must try and secure a perfect bloom on them. At some shows prizes are offered for the best bloomed Grapes, and the Black Alicante is generally the variety which secures this, as it carries more bloom than any other variety; then come Gros Colman, Lady Downe's, and the Black Hamburgh. Muscat of Alexandria is generally more heavily coated than most other white varieties, but tarnished bloom is generally not so much observed on white as black Grapes.

Those who are in the habit of syringing their Vines heavily from the time the fruit is formed until it begins to colour never secure richly bloomed Grapes, as few operations blemish the bloom more than constant syringing. Rubbing the berries with the fingers when thinning or at any other time also spoils the bloom, and although it may not be noticed much when the berries are green, it is very easily seen when the fruit has coloured. When the bloom has been carefully preserved during the time the fruit was green it must be equally well taken care of after it is ripe, as then it is more easily tarnished than ever. It is very necessary to avoid touching the fruit with anything at all times. In thinning use a little forked stick to hold the bunch steady, but do not touch it with the hand. When anything has to be done to the shoots do it with the utmost care; and lastly, when the Grapes are ripe never entirely close the house when there is much moisture in the atmosphere, as it will settle on the berries and run down them, leaving them spotted, streaked, and worse looking than if they had no bloom at all.—A KITCHEN GARDENER.

CARNATIONS AND PICOTEES.—No. 6.

WORK FOR JULY.—Remove all weeds from the surface of the soil in the pots. Tie up the flowering stems as fast as they grow, but not too tightly. For top-dressing employ a compost of equal parts of turfy loam, decomposed horse manure, and leaf soil. If the soil is light substitute cow dung instead of horse dung. Keep a good look-out for aphides, and destroy them at every opportunity. Should the weather become warm it is a good practice to syringe the plants in the morning, watering them in the evening when they require it. Water on the outside of the pots with the rose on the watering can, as it is very beneficial to the plants to maintain a moist atmosphere when the weather is hot and the ground dry.

Any plants which may be forward enough with their flowers if required for exhibition must be disbudded: the plan I adopt is to remove all buds for two or three joints below the leading or crown bud. Some few varieties at times do not require any disbudding, as they will only throw up perhaps one side bud in addition to the leading bloom; as for instance the varieties Mayor of Nottingham, P.F., and Sibyl, R.F. Stop any spindles which may form on the young growths by just pinching out the lead: in early situations these will frequently give a good layer. There are, however, a few varieties in which it is wise to allow one or two of the spindles to bear flowers, otherwise the whole of the growths will spindle. Bear in mind to disbud the spindle close, leaving only the crown bloom, which will generally extend the blooming period a fortnight to three weeks. When the flower buds are growing the plants and the bloom will be all the better for being occasionally supplied with weak liquid manure. The proportion in which it may be used is, say, one ounce of guano to the gallon of water for plants which are grown in strong soil; whilst those which are in light compost may have liquid manure prepared from sheep dung, new horse droppings, or cow dung, taking care not to use it too strong-in fact it is better to give it weak and

When the buds are sufficiently advanced tie them to prevent them bursting. The best material I find for that purpose is unbleached strong linen thread well waxed with beeswax, of which I always carry a ball in my pocket at this time of the year. In tying use two knots, drawing the ends so that you can feel the first tie is firm round the bud, when the other tie may be made as tight as possible, using always a reefer's or weaver's knot. There are some varieties that require tying two or three times. Jenny Lind, C.B., frequently wants tying, owing to the buds being so liable to burst, when very young, more particularly when a large flower is wanted, as it is then disbudded harder than it would otherwise be if

only wanted for an ordinary stage bloom.

It will be well to have all ready for carding the blooms if wanted for exhibition. The best place to obtain the cards is from Mr. George Meek, Crane Court, Fleet Street, London. The two sizes generally employed are 3\frac{1}{2} and 3\frac{1}{2} inches in diameter. In carding the bloom see that the hole of the card is large enough so that it does not press on the calyx; for this purpose the hole should be enlarged to five-eighths of an inch in diameter, and in some cases even larger, supporting the card with a circle of soft paper starred in the middle, which will be found quite sufficient to bear up the card. Those who have not yet been initiated into the science of dressing will do well to procure the tools for that purpose in readiness against the time they may be wanted. The instruments necessary are a pair of scissors, two pairs of tweezers, one steel for turning back the points of the calyx and removing any self or deformed petals, the other of fine ivory for laying out and placing the petals in position. In addition a small camel's-hair brush will be found useful for brushing off any dust which may accumulate on the flowers. The best tweezers can be procured from Mr. B. Simonite, Rough Bank, Sheffield, who will forward them by post in a case sufficiently large to hold a small brush as well.

PLANTS IN BEDS.—Always be on the look-out for slugs and caterpillars, which can soon destroy a plant. Another enemy is the black grub of the daddy longlegs; this, however, does not do much injury at this time if the soil is firm. Tie up the Tie up the flower stems, disbud, and watch for green fly. In light soils if the weather proves dry it will be well to give a watering—not sprinkling—betwixt the rows, syringing the plants frequently in hot sunny weather. Stir frequently amongst the quently in not sunny weather. Stir frequently amongst the plants, and at the latter end of the month give a top-dressing of equal parts of turfy loam and decomposed horse dung.

SEEDLINGS.—These should be planted out as soon as the first pair of true leaves appear which follow the cotyledons,

and not when the cotyledons appear as stated at page 404.

Should the plants at any time prove too close when planted in the boxes give them another shift. If the soil becomes caked stir it frequently, and if any soil is splashed up from heavy rains into the hearts of the plants brush it out with a small stiff brush. Look out for all kinds of vermin and remove them at once. Some seedlings come like a brush: it is a good plan when too many shoots or branches are formed to remove some of them, leaving not more than a couple. The sooner this is done the better. Those who intend wintering the plants in the open will do well to make the ground ready by digging it over deeply, mixing some well-decomposed manure in, and if the soil is light adding marl or road scrapings, or if heavy add some burnt refuse and leave it rough until wanted for planting out,-GEORGE RUDD.

AXWELL PARK GARDENS.

HAVING visited the gardens of Axwell Park, the seat of Sir Henry Clavering, Bart., about three weeks ago, and being shown through the houses, I was much struck by the magnifisnown through the houses, I was intend by the magnifi-cence of the Calceolarias grown in 8-inch pots, while several were in 6-inch pots. Some of the plants measured about 3 feet in diameter, and the flowers were very large and hid the foliage entirely. The plants were arranged with some good specimens of Spiræa japonica, scarlet Pelargoniums, Azaleas, &c. The stove plants also appeared remarkably well. The early vinery is a small structure which was planted with young Vines about two years ago. They are doing very well and bearing a fair crop, and the bunches are beginning to colour. The late vinery is a larger house, the Grapes had just been thinned, and there will be a good crop. The varieties were chiefly Black Hamburgh and Muscat of Alexandria. In

the Peach houses the trees were bearing fine fruit and were

very vigorous.

Gloxinias were handsome; they are grown in 6 and 8-inch pots, and were each bearing from eight to twelve large blooms. The flower garden has lately been laid out from a design suggested by Sir Henry Clavering, and when filled with bedding plants the beds will present a very gay appearance. The kitchen garden is about two acres in extent and walled in, and the different crops are in excellent condition. A preat improvement in the walks is noticeable; they are edged with light-coloured stone, and appear clean and neat. Much credit is due to Mr. Cowan, the head gardener, who is a young man of great intelligence, industrious both in and out of doors, courteous to visitors, and I may say second to none in his profession in the north of England.—D. McLAREN.

FRUIT PROSPECTS.

ONCE again are our hopes disappointed as regards the fruit crop. After a winter of almost unparalleled severity, followed by a very backward spring, we fondly hoped that what the weather and the birds had left for us would then have a chance of becoming developed; but not only is the fruit crop to a great extent destroyed (that we are unfortunately becoming accustomed to), but in my own case Peach trees are almost killed, and Pear trees away from the walls are very much injured, the growth being stunted, and much of it looks as if scorched; a few sorts only have a crop and appear uninjured, and as these must be hardier in some respects than the others they are worth taking note of. They are Monarch, Louise Bonne of Jersey, Ne Plus Meuris, and Bellissime d'Hiver as pyramids; and Old Colmar on a west wall. Beurré Diel, Beurré Hardy, Fondante d'Automne, Joséphine de Malines, and Jargonelle as pyramids have a few fruit; and the same may be said of Duchesse d'Angoulème, Glou Morçeau, Jargonelle, Joséphine de Malines, Jaminette, Napoleon, and Bergamotte Esperen on walls. Most other sorts have no fruit at all.

Plums are very clean and healthy, but are carrying barely half a crop, and there is no fruit on standards. Purple Gage, Late Rivers, and Kirke's only have a full crop, and these are on a west wall. In the same aspect Green Gage, Cooper's Large, and Imperial de Milan have about half a crop; while Jefferson, Golden Drop, and Guthrie's Late Green have very few fruit, and Ickworth Impératice and Washington none at all. On an east wall Purple Gage is the only sort which reaches half a crop; White Magnum Bonum, Green Gage, and Golden Drop have less; Washington, Reine Claude de Bavay, Frogmore Late Golden, Blue Impératrice, and Ickworth Impératrice have none. Early Rivers on a south wall has a few fruits, and the same may be said of Early Favourite in a similar position as well as on a west wall. On a north wall the crop is perhaps the most regular, but it is also a very thin one. The sorts grown in this aspect are White Magnum Bonum, Victoria, Orleans, Blue Perdrigon, Coe's Late Red, and Prince of Wales, all of which have some fruit on. Golden Drop, however, in the same position has no fruit, and this sort, let me remark, which is generally one of the surest, is in every position remarkable this season for its want of fruit.

Dessert Cherries on walls are a moderate crop; on standards there are next to none, while Morellos are overcropped.

Of Apples it is too early to speak with certainty. The bloom has been abundant and beautiful beyond description; it was strong also and perfect to all appearance, but for some reason or other much of it is falling and leaving nothing behind it.

Currants are abundant, but will be undersized. Gooseberries are a fair crop and very good, but we have had plenty to do to keep them clear of the caterpillar. Probably not many of your readers have noticed what a difference there is in the flavour of different varieties of Gooseberries when used in the green state. I have not found any other kind yet so well flavoured as Warrington, but I dare not tell the cook of this. There is also a great difference in the varieties of Rhubarb, and the largest-growing sorts are not the sweetest.

Strawberries are blooming abundantly, but the flowers of Keens' Seedling and its allies are weak, owing doubtlessly to the leaves having been killed by the winter. Those sorts on which the leaves remained green are stronger and promise to do well; but whenever will they ripen? There is not even a Black Prince swelling up yet. When, too, shall we be able to layer runners for forcing? I am pulling the flowers off a portion of Vicomtesse Héricart de Thury to give the runners a better

chance, and I may perhaps thereby secure an autumn crop on the old plants.

Fig trees are evidently hardier than Pears, for where the wood was ripened there is an abundance of fruit showing; a few unripe shoots only are killed back.—WM. TAYLOR.

THE NATIONAL ROSE SOCIETY'S SHOW, CRYSTAL PALACE.—June 28th.

The great Rose Show of the year—a Show that has the support of a special Society for the production and encouragement of the queen of flowers—was held on Saturday last under the most diradvantageous circumstances possible, the season being one of the most backward and sunless on record. Not one real summer day can truly be said to have appeared during the month of June; a series of low temperatures, oftentimes accompanied with heavy soaking rains, hail, and thunder, have been continued down to the very day before the Show. Many earnest efforts were made to effect a postponement of the day in order that a greater number of growers might be able to take part in this national contest; but very few outside the pale of management know the difficulties that stand in the way of altering fixtures, however much it may benefit the exhibitors; and with large companies such as that of the Crystal Palace, whose arrangements are fixed and published months beforehand, it is simply impossible to alter dates. The executive would gladly have done so, but were unable; consequently, notwithstanding the paucity of Roses throughout the country, this Society was obliged to hold their annual southern Exhibition on the date originally fixed, and we confess we were not prepared to see as many Roses collected together as were there, especially when the five great Rose nurserymen—Messrs. Cant, Cranston, G. Paul, W. Paul and Turner, were unable to compete. The quality also, except in a few instances, was better than we could have expected for the most unpropitious season that they have endured. The great contest between the two champions (Mr. Baker, Exeter, and Mr. Jowitt, Hereford) was mutually arranged to take place at the next National Show in 1880.

mutually arranged to take place at the next National Show in 1880.

We commence the schedule with Class 1, which is open to nurserymen only for seventy-two distinct varieties, the premier prize falling to a collection brought from "sunny Devon" by Messrs. Curtis, Sanford, & Co., Torquay; and very fine, even, and fresh the blooms were, consisting of Victor Verdier, Eugene Appert, La France, François Michelon, Homère, Jules Margottin, Charles Lawson, Marquise de Castellane, Marie Baumann, Comtesse de Serenyi, Cheshunt Hybrid, Général Jacqueminot (one of the brightest and most perfect Roses in the Show), Prince Camille de Rohan, Auguste Rigotard, Madame Charles Wood, Abbé Bramerel, Annie Laxton, Antoine Ducher, Moiré, Abel Carrière, Madame Lacharme, Sénateur Vaisse, Mdlle. Bonnaire, Rubens, Ferdinand de Lesseps (very good), Elie Morel, Dupuy-Jamin, Mdlle. Eugenie Verdier, Hippolyte Jamain, Marie Van Houtte, Xavier Olibo, Comte de Paris, Monsieur E. Y. Teas, Baronne de Rothschild, Madame Victor Verdier, Maréchal Niel, Duke of Edinburgh, Duchess of Edinburgh, Duchesse de Vallombrosa, Charles Lefebvre, Miss Hassard, Madame Thérèse Levet, Abel Grand, Exposition de Brie, Madame Trifle, Princess Beatrice, William Jesse, Peach Blossom, Magna Charta, Comtesse de Charillant, Souvenir de Malmaison, Baronne de Maynard, Monsieur Fillion, Lord Clyde, Madame Clémence Joigneaux, Horace Vernet, Lord Macaulay, Lamarque, Mabel Morrison, Marguerite Brassac, Madame Knorr, Madame Ferdinand Jamin, Narcisse, and La Rosiere. Mr. Henry May, The Hope Nurseries, Bedale, Yorkshire, was awarded the second prize for a very even collection, but the majority of them were smaller in size than the first-prize collection.

collection.

For forty-eight varieties, distinct, three trusses of each, Messrs.
Keynes & Co., Salisbury, were first with the following creditable
collection:—John Hopper, Mdlle. Eugénie Verdier, Camille Bernardin, Gloire de Dijon, Marie Guillot, Marie Baumann, Princess
Charlotte de la Tremouille, Madame Victor Verdier, Dr. Andry
(exquisite), Miss Hassard, Marguerite Brassac, Jules Margottin,
Dupuy-Jamin (very fine), Devoniensis, Monsieur E. Y. Teas, Victor Verdier, Ferdinand de Lesseps, Maréchal Niel, La Rosière, Abel
Grand, Cheshunt Hybrid, Madame Willermoz, Sénateur Vaisse,
Madame Thérèse Levet, François Louvat, Clotilde Rolland,
Horace Vernet, Tour Bertrand, Baronne de Boustetten, Marie Van
Houtte, Sir Garnet Wolseley, Madame Marie Verdier, John Fraser,
Pitard, Souvenir de Malmaison, Barthelemy Joubert, Souvenir d'un
Ami, Charles Lefebvre, Royal Standard, Duke of Edinburgh, La
France, Exposition de Brie, Céline Forestier, Maurice Bernardin,
Madame de Laboulaye, Fisher Holmes, and Boule de Neige. Mr.
May was again placed second with a very fresh collection, but
would have devoted more space to them. To cram seventy-two
bloon in an ordinal v twenty-four box does not show them off in
the best cossible man er; however, it is no easy task to cut such
a quantity of blooms, which must have been grown entirely under
glass, seeingt. at theye; we from Yorkshire.

In the class for thirty-six single trusses there were three competitors. Messrs. Kinmont & Kidd, Canterbury, Kent, were a good first with a splendid thirty-six, remarkable alike for size of bloom and brightness of colour. They comprised Edouard Morren, 'Gloire de Dijon, Sénateur Vaisse, Princess Beatrice, Madame Victor Verdier, Baronne de Rothschild, Marquise de Castellane, Princess of Wales, Madame Fillion, Dr. Andry, Mdlle. Thérèse Levet, Antoine Ducher, Duchess of Edinburgh, Monsieur Gabriel Tournier, Annie Laxton, Belle Lyonnaise, Madame Emma All (splendid), Maréchal Valliant, Victor Verdier, Maréchal Niel, John Hopper, Abbé Bramerel, Julie Touvais, Baron Haussmann, Marquise de Gibot. Marguerite Brassac, Cheshunt Hybrid. Marque nopper, Abbe Bramerel, June 100vals, Baron Haussmann, Marquere quise de Gibot, Marguerite Brassao, Cheshunt Hybrid, Marquise de Mortemart, Madame Lacharme, Felix Genero, Dupny-Jamin, Duke of Edinburgh, Horace Vernet, Madame Victor Verdier, and Monsieur Noman. Mr. W. Corp, High Street, Oxford, obtained the second prize with a fresh collection, the flowers being smaller in size; and Mr. Piper, Uckfield, Sussex, was awarded the third prize. For twenty-four distinct varieties, three trusses of each, these ways again three conventions.

were again three competitors. Messrs. Curtis, Sanford, gained the first position with a very excellent collection, having

gamed the mist position with a very excelent confection, having amongst them particularly fine blooms of Mdlle. Eugénie Verdier, Victor Verdier, Princess Beatrice, and the "Old General." Mesers. Keynes & Co. occupied the second place, and Mr. May the third. For twenty-four distinct single trusses Mesers. Kinmont & Kidd were deservedly awarded the first prize for undoubtedly the finest collection in the Show, and consisted of Annie Laxton, John Manney Laxton, Prince Carrilla & Parameter Andrews. Hopper, La France, Prince Camille de Rohan, Souvenir Arthur de Sansal, Baronne Haussmann, Duchesse de Vallombrosa, Etienne Levet, Duke of Edinburgh, Marquise de Mortemart, Camille Bernardin (very fine), Maréchal Niel, Antoine Ducher, Madame Emma All, Dupuy-Jamin, Henri Pages, Monsieur E. Y. Teas, Devoniensis, Victor Verdier, Mdlle. Bonnaire, Louis Van Houtte, Marquise de Gibot, Duke of Wellington, and Madame Thérèse Levet. Mr. W. Corp was awarded the second prize for a highly creditable stand containing a good Maréchal Niel and several other Teas. Mr. W. Piper was third. Messrs. James Mitchell & Son, Pitdown, Uckfield, Sussex, exhibited a good collection of twelve Teas or Noisett's, distinct, which gained the premier prize. Mr. W. Piper was awarded the second prize. Messrs. Mitchell & Sons' collection consisted of Duc de Magenta, Souvenir d'Elise Vardon, Devoniensis, Maréchal Niel, Comte de Paris, Elise Sauvage, Moiré, Jean Pernet, Adam, Josephine Malton, and Comtesse Ouvariffe. The amateurs' classes were fairly well filled except in some instances, the most remarkable being the entire absence of competition in the class for forty-eight varieties. Several meritorious Sansal, Baronne Haussmann, Duchesse de Vallombrosa, Etienne

netition in the class for forty-eight varieties. Several meritorious collections were staged, which included generally good blooms. For thirty-six distinct single trusses five prizes were offered, and only three competitors appeared. Mr. John Hollingworth, Maidstone, secured the highest award with a collection of generally good and substantial blooms. The best were Beauty of Waltham (excellent), Maréchal Niel, Prince of Wales, Maurice Bernardin, Marie Baumann, Charles Lefebvre, Baronne Prevost, Belle Lyonnaise. Annie Laxton. Duke of Edinburgh. Souvenir d'un Amise Lexton. Marie Baumann, Charles Lefebyre, Baronne Prevoet, Belle Lyonnaise, Annie Laxton, Duke of Edinburgh, Souvenir d'un Ami
(very fine), Victor Verdier, Camille Bernardin, Madame Willermoz,
Comte de Paris, and Dupuy-Jamin. Mr. R. N. G. Baker, Heavitree, Devon, followed with some fine blooms, among which we
noted Cheshunt Hybrid, Ferdinand de Lesseps, Kavier Olibo,
Dupuy-Jamin, Annie Laxton, and Duke of Edinburgh. Mr.
Joseph Davis, Wilton, Salisbury, secured the third prize with a
collection of average merit, but Marquise de Castellane, Gloire de
Bordeaux, and Triomphe de Rennes were well represented. Bordeaux, and Triomphe de Rennes were well represented.

For twenty-four distinct single trusses the competition was a little more lively, eight collections being staged. The premier prize was deservedly awarded to Thomas Jowitt, Eeq., Old Weir, Hereford, whose flowers were substantial and even; but the most conspicuous of all, and one that attracted general admiration, was a magnificent bloom of Niphetos. Many others were good, par-ticularly Horace Vernet, Marechal Niel, Cloth of Gold, Souvenir d'un Am, Mr. Wilson Saunders, Exposition de Brie, Princess Mary of Cambridge, Devoniensis, Miss Hassard, Ferdinand de Lesseps, Gloire de Dijon, and Prince Camille de Rohan. Mr. John Hollingworth was second, and exhibited several fresh and excellent blooms—notably Souvenir d'un Ami, Maréchal Niel, Marie Baumann, Victor Verdier, Jules Margottin, Duke of Edinburgh, and Charles Lefebvre. Mr. John Edwards, Stisted Rectory, was while with mthe amplif downs but Salter of Torother and House her Sal

Charles Lefebvre. Mr. John Edwards, Stisted Rectory, was third with rather small flowers, but Sultan of Zanzibar and Horsoe Vernet were good. Mr. W. Harrington, gardener to E. Mitchell, Esq., Romford, Essex, was fourth, Mr. R. N. G. Baker fifth, and Mr. L. Stephenson, Redholme, sixth.

In the class for twelve distinct varieties, three trusses of each, there were four exhibitors, Mr. John Hollingworth securing the first place with a very fair collection, including Comte de Paris, Anna Alexieff, Exposition de Brie, Souvenir d'Elise Vardon, Marie Baumann, Cheshunt Hybrid, Charles Lawson, and Sonvanir d'un Anna Alexier, Exposition de Brie, Souvenir d Binse Vardon, Marie Baumann, Cheshunt Hybrid, Charles Lawson, and Souvenir d'un Ami. The second prize was secured by Mr. Joseph Davis, blooms of the following varieties being well shown—Gloire de Dijon, Abel Grand, Jupuy-Jamin, Celine Forestier, Marie Baumann, Maréchal Niel, Cheshunt Hybrid, Charles Lefebvre, and Jules Margottin. Mr. Mayo, Corn Market, Oxford, was third. For twelve distinct single trusses there were five entries, but nothing

possessed of unusual merit was staged. The chief position was allotted to Mr. W. H. Wakeley, Rainham, Sittingbourne, Kent, whose collection included large blooms, but some were rather to full. The principal varieties were Charles Lefebvre, Miss Poole, Prince Camille de Rohan, Mons. Ettenne Levet, Ferdinand de Lesseps, and Counters of Oxford. Mr. J. Ridout, gardener to B. Haywood, Esq., Woodhatch Lodge, Reigate, followed with Jules Margottin, Pierre Notting, Devoniensis, Horace Vernet, Baronne de Rothschild, and others. E. Mawley, Esq., Lucknow House, Addiscombe, was third; and Mr. Alfred Evans, Marston, fourth. fourth

House, Addiscombe, was third; and Mr. Alfred Byans, Marston, fourth.

In the class for nine distinct single trusses there were eight competitors for the five prises offered. The Rev. H. Biren, Harbisdown, Canterbury, was a good first, some of the bleems being excellent. The varieties were La France, Camille Bernardin, Souvenir d'un Ami, Kavier Olibo, Cheshunt Hybrid, Duke of Edinburgh, Dr. Andry, and Capitaine Christy. Mr. Killick, Wavering, Maidstone, was second, the best blooms in his stand being John Hopper, Horace Vernet, and Gloire de Dijon. Mr. Wakeley was an equal second with good examples of Jules Margottin, Pierre Notting, and Marquise de Castellana. The Rev. Alan Cheales, Brockham Vicarage, Surrey, was third; R. Mawley, Eq., fourth, and Mr. Evans fifth. Mr. Tranter, Upper Assendan, Henley-on-Thames, obtained the first prise for the enly collection of six distinct single trusses, Camille Bernardin, Maréchal Niel, Edouard Morren, and Duchess of Edinburgh being well represented in his stand. In the class for six distinct single trusses of Boses grown in the suburbs there were four entries. Mrs. Lucy Denison, The Observatory, East Sheen, was awarded the first prize, which consisted of a piece of plate presented by Edward Mawley, Eq. This lady's collection included very fair specimens of Souvenir d'Elise, Gloire de Dijon, Glory of Waltham, Céline Forestier, and Charles Lawson. Mr. James Wight, Gips, Hill, was second with poor flowers; and Mr. James Wight, Gips, Hill, was second with poor flowers; and Mr. James Wight, Gips Hill, was second with poor flowers; and Mr. James Wight, Gips Hill, was second with poor flowers; and Mr. James Wight, Gips Hill, was second with poor flowers; and Mr. James Wight, Gips Hill, was second with poor flowers; and Mr. James Wight, Gips Hill, was second with poor flowers; and Mr. James Wight, Gips Hill, was second with poor flowers; and Mr. James Wight, Gips Hill, was second with poor flowers; and Mr. James Wight, Gips Hill, was second with poor flowers; and Mr. James Wight, Gi gate Road, third.

gate Road, third.

For twelve distinct Teas or Noisettes (single trusses) there was good competition, there being no less than ten entries. Mr. James Brown, gardener to A. J. Waterlow, Req., Reigate, staged the premier collection, comprising excellent examples of Josephine Malton, Rubens, Gloire de Dijon, Jean Pernet, Marie Van Houtte, Devoniensis, Cheshunt Hybrid, Alba Rosea, and Maréchal Niel. Mr. W. Harvington was second with fine specimens of Souvenir d'un Ami, Triomphe de Rennes, Madame Margottin, Marie Van Houtte, and Souvenir d'Elise. Mr. John Hollingworth was third, and Thomas Saville, Req., fourth. There were six entries in the class for nine Tea or Noisette Rosea, but the merits of the majority were not very high. The Rev. H. Biron had some good blooms in his first-prise collection, especially Souvenir d'un Ami, Caroline Kuster, Rubens, Madame Willermoz, and Marie Van Houtte. Mrs. Green, Maidstone, was second with large flowers of Maréchal Niel, Belle Lyonnaise, Devoniensis, and Comte de Paris, also very fine. Mr. Wakeley was third.

The number of exhibits in the open classes was very small, and in four only were prizes awarded. Messrs. Curtis, Sanford and Co., Devon Roseries, Torquay, obtained the second prize for the

in four only were prizes awarded. Mesars. Curtis, Sanford and Co., Devon Roseries, Torquay, obtained the second prize for the only stand of twelve single trusses of Abel Carrière, which were fairly good. There were eight entries for twelve single trusses of Maréchal Niel, the premier prize being secured by Mr. Joseph Davis with large and good blooms. Mr. W. Corp, Oxford, was a close second, and Mesars. Mitchell & Sons were third. For twelve single trusses of a Hybrid Perretual Rose there were for twelve single trusses of a Hybrid Perpetual Rose there were four entries. Messrs. Curtis obtained highest honours with John Hopper, the flowers of which were small, but fresh and bright. Mr. Baker was next in order with Prince Camille de Rohan, next and good blooms. Mr. J. W. Piper, nurseryman, Uckfield, was third with Souvenir de Charles Montault.

In the class for twelve Teas or Noisettes not named in the In the class for twelve less or Noisettes not hamed in the schedule Mr. W. Farren, Cambridge, was awarded the first prize for an exquisite stand of Souvenir d'un Ami. Mr. G. Prince, Oxford, won the second place with the same variety; and Mr. James Brown was placed equal third with Mr. Baker, Mr. Brown exhibiting Belle Lyonnaise, and Mr. Baker Cheshunt Hybrid. There were also several other creditable collections staged in this class, but the first-prize stand contained a very fine twelve-large in size, perfect in shape and colour, and all remarkably even.

Several miscellaneous exhibits were staged, including cut Boses, Pelargoniums, Pyrethrums, &c. From Mr. Mayo came five stands of various Roses. Mr. A. Evans sent a collection of blooms, also Mr. John Matlock and Messrs. Mitchell & Sone. Mr. W. Farren, How House, Cambridge, exhibited a box full of busches of a little white Bose named Fairy Queen. Mr. Corp of Oxford sent an extensive collection of various Roses. Mr. Ware, Hale Farm Nurseries, had collections of Pyrethrums; Mr. Hooper, Bath, Pansies, Pyrethrums, and Ranunculuses; Mr. Boller a collection of miniature Cactt; and Mr. Cannell, Swanley, Kent, several boxes of Pelargoniums, representing Regal, Show, and Fancy varieties, and double and single Zonals. A handsome group of Tuberous Begonias and foliage plants was arranged by Messrs. Laing & Co., and an artistic rockery and fountain were exhibited by Messrs. Dick Radelyffe and Co., Holborn. In the afternoon their Royal Highnesses the Duke and Duchess of Comnanght and the Duckess of Raisburgh honoured the Exhibition by their presence. The illustrious visitors inspected the boxes of Roses attended by Canon Hole, and the Duchess of Connaught accepted a copy of the President's "Book about Roses," a handsome specimen of Maréchal Niel Rose from the Rev. H. D'Ombrain, and an illuminated copy of the Society's Report (specially prepared for the occasion), from Mr. E. Mawley. The weather was extremely fine, and during the whole of the day the paths between the long tables on which the Roses were arranged were crowded by thousands of aristocratic visitors, who had assembled to welcome the Royal couple. The Exhibition was undoubtedly a great financial success, however unsatisfactory it might appear from a resarian's point of view.

EUCALYPTI AND TREE FERNS IN SCOTLAND.

I HAVE read with much interest the reports given in the Journal of Horticulture of the effects on vegetation of last winter's severe and long-continued cold. As I do not see mention of any place in Scotland where Eucalyptus globulus has survived, I write to mention that in the island of Arran on the Frith of Clyde there are several trees untouched, two at Brodick, the larger being about 30 feet in height, and one at Corrie in the same island. The larger tree at Brodick grows in a wood; it was raised by me in 1872, and given, when a year old, to James Paterson, Esq., factor to His Grace the Duke of Hamilton, by whom it was planted where mentioned. It would have been much higher had it not two years ago during a storm lost its top and 12 feet of stem.

Alongside it are two other species, the seeds of which were sold to me as E. pendula. I suspect that one of them is E. smygdalina; the two differ in the leaves, the one being sessile and opposite, those of the other alternate and having a short stalk. They are also somewhat different in appearance; both agree to the name they bear in being weeping in habit.

At Cromla Gardens, Corrie, the fine Australian Tree Fern, Dicksonia antarctica, has stood without protection for twelve years, and it has now a stem 22 inches in girth and 14 inches in height. It is uninjured by last winter, and is now sending up ten new fronds in addition to about twenty previously existing. Last summer I planted in the same garden two other Tree Ferns, Dicksonia squarrosa and Cyathea medullaris. The former had no protection and is uninjured; the latter was covered around its stem and above its crown with leaves, yet all its fronds with the exception of one were destroyed, but the crown was uninjured, and now it is shooting vigorously. Both the plants were kindly given to me for this experiment by Mr. Gray, gardener, Newfield, Ayrshire, who had received them from a son in Christchurch, Canterbury, New Zealand.—DAVID LANDSBOROUGH.

RICHMOND HORTICULTURAL SOCIETY'S SHOW. June 2021.

THE weather was extremely unfavourable to the success of this Exhibition, particularly in the earlier part of the day when the rain had rendered the somewhat low land of the Old Deer Park a veritable swamp. Later on, however, the sun struggled through the heavy masses of clouds and considerably improved the aspect of affairs, for taking advantage of the finer weather great numbers of people flocked in, and when H.S.H. the Duke of Teck and H.S.H. Princess Mary arrived there were plenty to give them a heavy response.

The exhibits, which were very numerous and some of especial excellence, occupied five tents, the two largest containing the out flowers, diamer-table decorations, and chief classes devoted to plants; in another were arranged the groups of plants, in a fourth were the fruit and vegetables, while a small one contained the

cottagess' productions.
STOVE AND GREENHOUSE PLANTS.—These were shown in very good condition, three fine collections of nine each being staged. The first prise was secured by Mr. Child, gardener to Mrs. Torr, Garbrand Hall, Ewell, who exhibited very even and beautiful specimens of Gleichmia Mendeli, Todes superba, Clerodendron Balfouriasum, Erica Cavendishiana, Aphelexis macrantha purpersa, and an unique Cypripedium Stonei bearing two dosen superb flowers. Mesers: Jackson & Son followed also with fine plants, Brica depressa being in beautiful condition, and Pimelea mirabilis very fair. Mesers: Peed & Son, Lower Streatham, were third, their collection including an extraordinary large Pimelea mirabilis over 5 feet in diameter and profusely flowered. In the open class for six the first prise was awarded to Mr. Hinnell, gardener to H. Davis, Esq., Anglesca House, Surbiton, two of his plants being very striking; Krica tricolor dumosa was simply exquisite, so even, healthy, and abundantly flowered that it could scarcely

be surpassed. Phoenocoma prolifera Barnesi was remarkable on account of its vigour and the well-coloured flowers. In the other class for six, which was confined to persons residing within the Society's district, Mr. Crafter, gardener to the Rev. W. Finch, Kingston Hill, received the first prize for fair plants. He was followed by Mr. Atrill, gardener to J. Freake, Esq.; Bank Grove, Ham.

PELARGONIUMS.—The competition was not very brisk in the classes for these plants, but Mr. James, gardener to W. Watson, Esq., Redlees, Isleworth, exhibited some fine specimens. He obtained the premier award in the open class for six Show warfeties with even and well-flowered plants, the blooms large and well formed; the best were Prince Leopold, Princess of Denmark, Archduchess, Mary Hoyle, and Snowflake. Mr. Wells, gardener to C. W. Selwyn, Req., Selwyn Court, Richmond, was placed third. In the corresponding district class Mr. James was the only exhibitor, and again received the first prize; but his plants were not so good as in the previous collection. The same exhibitor staged the best specimens of six Fancy varieties; Fanny Gair, East Lynne, and Mirella were very fine. Zonal varieties were not remarkable, except perhaps the first-prize collection of six from Mr. Morrell, gardener to S. Butter, Esq., The Cedars, Richmond, which included some profusely flowered plants. For six silver-foliaged varieties Mr. Tipping, Richmond, was first with small but fine plants, Lass o'Gowrie being very brightly coloured. Mr. Sallows was second, and Mr. Wells third. Mr. Tipping was also first with six golden-leaved varieties.

FUCHSIAS were fairly well represented. Mr. Morrell's premier

FUCHSIAS were fairly well represented. Mr. Morrell's premier collection of nine specimens were well grown and the flowers were numerous. Mr. Wells was next in order of merit, and his plants were rather deficient in bloom. Mr. Coles, gardener to W. Wigram, Esq., Twickenham, staged the best six varieties, and was followed by Mr. Morrell and Mr. Atrill, whose plants were irregular and untrained.

untrained.

FERNS were numerous, well grown, and vigorous. In the class for eight exotic species or varieties Mr. J. Hudson, gardener to H. J. Atkinson, Esq., Gunnersbury House, Acton, was awarded the chief prize. The most noticeable specimens in his collection were a large Dicksonis antarctica, a good Davallia Mooreana, and a beautiful Adiantum farleyense. Mr. East, gardener to T. Wigaa, Esq., East Sheen, obtained the second place with good plants, especially Cyathea dealbata. Mr. Wells was third. In the corresponding district class Mr. Atrill gained the first prize with fine plants, a specimen of Davallia pyxidata being remarkable for size and vigour. Mr. Morrell was second with very even plants. Hardy Ferns were very fresh and pretty, Mr. James's group of twelve varieties in particular; and Mr. Morrell's plants were well worthy of the second prize which he received.

One class was appropriated to fine-foliage plants, but confined

worthy of the second prize which he received.

One class was appropriated to fine-foliage plants, but confined to exhibitors from the Society's district. Very good specimens were staged, the colouring in the Crotons being unusually rich. The first prize was awarded to Mr. Bates, gardener, Poulett Lodge, Twickenham, for a collection including Croton Johannis, C. undulatus, Cocos Weddellians, and Areca Baueri, all very handsome but of medium size. Mr. Prickett, gardener to D. Francis, Esq., Richmond, was a good second, and Mr. Brown, St. Mary's Grove Nursery, was placed third. Begonias were in good form, and Mr. Morrell's six gained the premier award, Mr. Rast following with vigorous plants; the remaining prize was taken by Mr. Sallows, gardener to J. Flack, Esq., Twickenham. For six Coleuses there were six entries, but with the exception of Mr. Sallows's collection (first) and Mr. Atrill's (second) plants the colour was very indifferent and the specimens irregular. Caladiums were much finer than usual, and the exhibits were pretty even in merit. Mr. East and Mr. Morrell received the first and second awards respectively.

Orchids were only represented by three collections in the class for six specimens. Mr. James secured the chief position with fair plants. Mesers. Jackson & Son were next, and Mr. Child third,

CUT FLOWERS.—In the marquee devoted to table decorations and cut flowers there was a good display of epergnes and vases on a long table, but the Roses and miscellaneous flowers were scarce, particularly the former, which were also very poor in quality, and do not demand especial notice. There were over twenty exhibitors in the classes for decorated epergnes, &c., and many were very tasteful and elegant arrangements. The special prize of a silver medal offered by the Duke of Teck for the prettiest arrangement of three vases was awarded to Mrs. Chancellor, The Retreat, Richmond. Messrs. Veitch & Sons sent eight boxes of Rhododendron blooms, very fine and good varieties.

GROUPS.—Over ten competitors arranged their plants in the large marquee, and several of the groups were extremely beautiful.

GROUPS.—Over ten competitors arranged their plants in the large marquee, and several of the groups were extremely beautiful. In the class for a large group not to exceed 100 square feet Mr. Hudson was a long way before the other exhibitors with a most tasteful design that attracted general admiration. The groundwork was somewhat fiat, but otherwise excellent, and was composed of Gloxinias, Adiantums and Caladium argyrites intermixed producing a charming effect; over them hung grace ful Palms, which imparted a lightness and elegance simply ex

quisite. Messrs. Hooper & Co., Covent Garden, were placed second with a good group, and were closely followed by Messrs. Osborn and Sons, Fuliam; an extra prize was secured by Mr. Brown, and Sons, Fulham; an extra prize was secured by Mr. Brown, nurseryman, Richmond. Several other noteworthy groups were there, especially that for which Mr. Bates obtained the special prize offered by C. Turner White, Esq., of Kew. In this Cocos Weddelliana, Palms, and Adiantums played a prominent part, the edging being formed of Isolepis gracilis and Selaginella Kraussiana. Mr. Kinghorn, Sheen Nurseries, also contributed a large and handsome collection of plants. In the other tents Messrs. Veitch, Wells, Osborn, and Laing exhibited some very beautiful groups, for which silver and bronze medals were awarded. Mr. Boller also staged a group of succulents.

The competitors for the extra prizes were very numerous. We are unable to notice them individually, for over forty ladies and gentlemen offered prizes and the majority three each. The plants were far above the average degree of excellence, especially the

were far above the average degree of excellence, especially the

Dracenas and Palms.

FRUIT.—This was shown in quantity, and the quality was also good, particularly among the Grapes. For a collection of four dishes Mr. Fry, gardener to S. Baker, Esq., Haydon Hall, was first with wall-winned Brown Turker Fire amall but well finished. with well-ripened Brown Turkey Figs, small but well finished Foster's Seedling Grapes, a handsome Queen Pine, and a fair Hero of Bath Melon. Mr. Hopper, gardener to C. O. Ledwood, Esq., The Elms, Acton, followed with small but well-ripened fruit. Mr. Masters was third, the Grapes and Strawberries being scarcely ripe. Mr. Wagstaff, gardener to H. Elam, Esq., Isleworth, secured the premier prize for a dish of black Grapes with good examples of Black Hamburgh. Mr. Hoyle, The Cedars, Lee, Kent, and Mr. Child followed in the order mentioned with the same variety. Mr. Wagstaff was again first with three bunches of white Grapes, Muscat of Alexandria, large berries and fine bunch, but not fairly ripe. In the district classes Mr. Wagstaff and Mr. Bates carried off the principal prizes for Grapes and Pines with very good fruits.

Melons and Strawberries were very poor. Messrs. Suttons' prize
for a collection of Melons and Cucumbers was awarded to Mr.

Vegetables were not very numerous but of good quality, Messrs. Crafter and Wagstaff being the principal exhibitors. The cottagers' productions were contained in a small tent, and some were

of average merit; the window boxes were certainly good.

Notwithstanding the unpropitious weather the Show was very successful, and was in all respects one of the best ever held by the Society.

ARTIFICIALLY NETTED VICTORY MELON VERSUS VICTORY OF BATH.

I NOTICE in your report of the Fruit Committee held at South Kensington on June 24th, that I exhibited a Melon named Netted Victory, which proved to be "Victory of Bath artificially netted by scratching the skin with a sharp-pointed instrument when the fruit is young." I feel the Committee or your reporter has done me a cruel injustice for printing such an assertion, and I hope you will give me space to explain the

matter fully and fairly.

First, I have not this season grown Victory of Bath, and this I can prove by my young men who have had the charge of our Melons; and secondly, Victory of Bath is a green-fleshed, and Netted Victory a white-fleshed variety. The identical Melon shown at the meeting I authorised Mr. Barron to present to Messrs. James Veitch & Sons, and doubtless they will tell you it was a white-fleshed variety. I may also add when Messrs. Carter & Co. advertised Dell's Hybrid last season they mentioned that it was the only green-fleshed Melon certificated in 1878. I wrote to these gentlemen and asked for an explanation, telling them I had also received a certificate. They answered my letter, telling me mine was not a green but a white-fleshed variety, and this was the first time I had heard that we had three classes in Melons, thus showing to all intents and purposes I have been wrongly and cruelly reported.

In conclusion, and with reference to netting Melons, I may say we here make a practice of doing it, and hold that Melons metted have a more ornamental appearance at the dessert table. As gardeners we try to please the eye as well as the palate, and let us hope we succeed .- R. GILBERT, Burghley Gardens.

The report referred to was a simple record, without comment, of the unanimous decision of the Fruit Committee. are informed that the Committee were requested not to cut the fruit, so it is obvious they could not observe the colour of the flesh. The real question of import is the artificial netting process. Mr. Gilbert does not deny having scratched the fruit, and we trust he will be able to state that he informed Mr. Barron and Messrs. Veitch, to whom he alludes, that the netting was not natural. When the "netted" Victory was certificated on July 3rd, 1878, we think the Committee were not aware that

its marked characteristic-netting (which enhances considerably the value of an otherwise good Melon)-had been proand the varie of an otherwise good melon—mat been produced by artificial means. In our report of that meeting the Melon was described as coarsely and "peculiarly" netted, yet Mr. Gilbert did not hasten to explain the matter "fully and fairly." The Melon was then described as a green flesh (and appears to have been so considered by the raiser, or why his communication to Messrs. Carter & Co.?) and the public would probably consider it a netted form of Victory of Bath, the one fault of that good Melon being its general absence of netting.]

LEEDS HORTICULTURAL SOCIETY'S SHOW. June 25th, 26th, and 27th.

DIFFICULTIES of various kinds have been encountered by the Difficulties of various kinds have been encountered by the directorate of this Society, and many of them have been surmounted; but an impediment much too familiar, and which can neither be foreseen nor combatted, is a wet day. The first day of the Show now under notice was a pleasant one—dry and with a refreshing breeze blowing across Woodhouse Moor, on the margin of which the Horticultural Gardens are situated; visitors to the Exhibition were consequently numerous, the tents and gardens being crowded, and quite a throng of townspeople congregated at the entrance to admire and criticise the dresses as the ladies passed from their carriages to the gardens. Although the evening was fine and weather prospects fairly bright, yet there were gloomy forebodings that the next day would be wet—not because of any gathering of clouds, for the sky was clear, nor of any shifting of the wind, for it appeared settled, nor of any barometrical changes, for these were not adverse, but solely because a metrical changes, for these were not adverse, but solely because a settled conviction prevails in the public mind at Leeds that it must rain at the flower show. This "fixed idea" was reflected in one of the local journals, which commenced its report—"The Leeds Flower Show and a fine day!" referring, of course, to the opening day of the Exhibition. But the second day, as predicted without any philosophical reason, was unmistakeably wet. This was unfortunate both for the public of Leeds and the Exhibition Committee, for vast numbers must necessarily have been unable. was unfortunate both for the public of Leeds and the Exhibition Committee, for vast numbers must necessarily have been unable to visit an excellent Exhibition, and the receipts must have suffered in consequence, the second being usually designated the "money-taking day." Yet it does not always rain at Leeds Show, for last year the weather was fine, and we trust that many fine show weeks and fine shows will be enjoyed in the future by the inhabitants of this populous district.

The Exhibition we have now to notice was of considerable magnitude.

nitude and of a high average order of merit. In its arrangement also the Show was peculiarly enjoyable. Instead of a number of small tents and narrow passages a wide and lofty marquee 300 feet in length contained the specimen plants and groups: two other tents in connection with this containing—one chiefly Pelargoniums and Roses, the other fruit and cut flowers. In the large marquee the plants were arranged down the centre, except a marginal row next the canvas, and thus a wide promenade was afforded upwards of 200 yards in length in this tent alone. In the other tents, too, ample space was afforded for the visitors. In the centre of the chief tent a large stage of circular outline contained the specimen stove and greenhouse plants of Mrs. Cole and Son, J. F. G. Williams, Esq. (gardener, Mr. Tudgey), in competition for the principal prize. The plants were substantially the same as those exhibited at York and enumerated in our report of that Show. After a critical examination of upwards of half an hour's duration the Judges could arrive at no other decision, doing justice to both exhibitors, than to award them equal first prizes. justice to both exhibitors, than to award them equal first prizes. Mr. Tudgey's plants were generally the larger and Mrs. Cole's the fresher of the two collections. From the centre to one end of the tent were arranged the specimen plants in other classes—Ferns, fine-foliage and flowering plants, agreeably associated, and arranged on the grass. The corresponding end contained the groups arranged for effect. These constituted the chief feature of the

Exhibition and demand primary attention.

Last year there was only one class (open), for groups arranged for effect; and local exhibitors competed so well but unsuccessfully, that it was intimated in this Journal that they merited a class to themselves. A change in the arrangement of the groups was also suggested, so that each collection could stand out with more distinctness. This year the open class was retained, the lants not to occurs space exceeding 300 square feet, an adplants not to occupy space exceeding 300 square feet; an additional class being provided for amateurs residing in the county of York, the plants not to occupy space exceeding 150 square feet. The first prize in the last-named class consisting of a silver cup, value ten guineas, given by the Mayor of Leeds. In the open class two groups were arranged, and in the amateurs' class four. They were disposed down the centre of the tent, the base of each being circular and about 15 feet in diameter, the plants being arranged more or less in the form of cones about 10 feet high. With ample space between each two groups the effect of the six exhibits was highly imposing. The whole of the Judges were summoned to adjudicate in these classes, and it is questionable if

ever Judges had a harder "nut to crack" at any horticultural exhibition than in awarding the prizes in this competition. Every arrangement possessed points of merit, and every one of them also had defects; and so closely the one counterbalanced the other throughout, that it was only after long and close examination and discussion that the verdict was given, and not in one case was it given unanimously. In the open class the votes wore case was it given unanimously. In the open class the votes were equal for Mr. Tudgey and Mrs. Cole, and it was only by the Committee appointing a referee, who received the approval of every Judge, that the difficulty was solved, and the prizes were awarded to the two great exhibitors in the order named. Mr. Tudgey's group was composed of valuable plants (which in itself is no recommendation in a class of this kind), and they were arranged with some freedom, yet the effect produced was somewhat heavy; but the admitted desideratum that the pots be hidden was as nearly as possible attained, for not one pot or tub was obtrusive. The second-prize group was generally more light and elegant, but on one side, and that, moreover, facing the entrance to the tent, several large pots on which plants were standing, and also the pots containing the plants were very conspicuous, and this blemish, which must be convented the documents.

which must have occurred by an oversight of the decorator, proved a fatal one. The groups were composed of Palms, Cycads, and Crotons, brightened with a few Crotons, &c., and flowering plants. In the amateurs' groups the competition was extremely close, so close that every collection was nominated by some one of the Judges as worthy of the premier position; eventually, however, the cup was awarded to Mr. W. Sunley, gardener to J. Kitson, Esq., Spring Bank, Leeds. This group was the most formal of all, and was composed of the least expensive plants: but with its all, and was composed of the least expensive plants; but with its formality, its fault, it was the only collection in which the pots were not considerably exposed, and the only one also where flowers were sufficiently interspersed with Ferns, &c. Except the elegant terminal plant Cocos Weddelliana, a Stephanotis, and one or two variegated Yuccas, the plants were such as are usually employed in conservatory decoration—Spireas (Hoteias) Hydrangeas, Roses, Begonias, small Ericas, Coleuses, Pelargoniums, and Fuchsias, relieved with Ferns and enriched with a few Crotons Fuchsias, relieved with Ferns and enriched with a few Crotons and Dracenas, the margin being composed chiefly of Gloxinias and small Ferns. The plants were too closely packed, and the surface of the cone was too smooth, yet the effect was imposing, and on the whole the group, while acknowledged as faulty, was yet considered to possess fewer defects than the others, and hence was awarded the coveted prize. Mr. Hemming, gardener to Henry Oxley, Esq., Westwood, was placed second with a fine, free, ornamental, and bright arrangement. The central plant was a fine specimen of Aralia dactylifolia surrounded with Yucca aloifolia variegata, Cordyline australis, Pandanus Veitchii, and a good Cycas; in front of these were Palms placed between such plants as Kalosanthes, Clerodendron Balfourianum, Statice profusa, and cycas; in front of these were Paims placed between such plants as Kalosanthes, Clerodendron Balfourianum, Statice profusa, and well-flowered Fuchsias; the margin being composed of smaller plants of Ferns, Dracænas, Cypripediums, Crotons, and Deutzias. The fault of the group was that the pot of the central plant were too complicuous, and the flowering plants being half-specimens, rendered the arrangement somewhat "lumpy." The merit of the arrangement consisted in the good balancing of flowering and foliage plants. Third honours fell to John Harrison, Esq., St. John's Grove, Leeds. This was the most artistic arrangement of all, so far as the plants permitted—that is, all the other groups might have been improved by a different placing of the plants in them, but this was unimprovable except by additional plants. The great fault of the group, however, was the obtrusiveness of the tub containing the terminal plant, a good-sized specimen of the tub containing the terminal plant, a good-sized specimen of Chamærops Fortunei, which gave to the arrangement a top-heavy appearance. The merit of the group was the free and artistic manner in which the plants—small Tree Ferns, Cordylines and cut-leaved Japanese Maples very elegant, and Aralia Sieboldi variegata—were disposed. The marginal plants were Ferns, Isolepis gracilis, Bouvardias, Pelargoniums, Saxifraga pyramidalis, Hydrangeas, and Coleuses. More flowers were wanted, and if Mr. Harrison had bought a few ordinary window plants from the market the day previously (which according to the rules he was quite entitled to have done) and brightened the groups with them, and at the same time hidden the central tub, he would in all probability have secured the Mayor's cup. A fourth prize (extra) was worthily granted to Mr. Franklend, gardener to John Barron, was worthily granted to Mr. Franklend, gardener to John Barron, Req., M.P., Chapel Allerton Hall, for a very good arrangement of well-grown plants; indeed, many of them being half-specimens were not amenable to artistic grouping. The exhibitor was further handicapped by not having a central terminal plant, the pole of the tent occupying that honoured position, and as may be imagined, not picturesquely. The lessons derivable from the groups are that formal specimen plants of value, and which afford evidence of good culture and training, are not so suitable for the purpose in question as commoner flowering plants of lesser intrinsic value for associating with the Ferns. &c. : and that plants of anche were not amenable to artistic grouping. The exhibitor was purpose in question as commoner nowering plants of lesser intrinsic value for associating with the Ferns, &c.; and that plants of such character as Dracænas, Yuccas, Cordylines, and slender Palms should be brought boldly forward near the margin, and even elevated if needed to show their individuality and to break up the conventional even surface that prevails in plant-grouping. Such plants, toe, as Selaginellas, Panicum variegatum, Isolepis gracilis,

and even the common Moneywort or Loosestrife (Lysimachia Nummularia) would be found of great value in "finishing off" the groups. Yet with the faults noticed (and no harm can be done by naming them, but on the contrary good may ensue) it is questionable if a better exhibition of the kind has ever been seen at any provincial show. The Show Committee will do well to continue the classes, adding others, if possible, for smaller groups for another section of exhibitors, for it is obvious that where there is one cultivator who can stage in the specimen classes there are ten able to compete in groups of this nature.

Having referred somewhat lengthily to what was the most im-

naving referred somewhat lengthily to what was the most important feature of the Show, and moreover a system of exhibition of the Exhibition must be disposed of more briefly.

In the stove and greenhouse plant classes not named above some highly creditable specimens were staged. In the class for six plants Mr. Frankland secured first honours with a Clerodendron, Anthurium, Phœnocoma, Bougainvillea, Stephanotis, all very good, and a moderate Erica. Mr. Tudgey was second, and Mr. Tuke, gardener to G. Gelder, Esq., Cliffe View House, Headingley, third; Ixora floribunda nana and Dipladenia Brearleyana ingley, third; Ixora horbunda nana and Dipladenia Brearleyana being much admired. In the class for three plants Mr. Tudgey won first honours with medium-sized specimens. Erica Cavendishiana was splendid, E. mutabilis excellent, and Clerodendron Balfourianum very good. Mr. Wm. Sunley was placed second, his noticeable plant being a remarkably fine example of Stephanotis (one of the finest plants in the Show), and Mr. Frankland

Ornamental-foliaged plants were very fresh and good. In the class for six plants Mrs. Cole & Son secured the first position with fine examples of Thrinax elegans, Kentis Fosteriana, Cycas revoluta, Cocos Weddellians, Croton Weismanni, and C. Disraeli. Mr. Winterbourne, gardener to T. Simpson, Esq., Westwood, was second, his best specimens being Areca sapida, Latania borbonica, Encephalartos villosus, and Dasylirion glaucum. Mr. Tuke was a good third, Cycas circinalis being very fresh, and Yucca aloifolia variegata excellent.

Herne were both numerous and superior. Mrs. Cole & Son were

Ferns were both numerous and superior. Mrs. Cole & Son were first for six plants including immense Gleichenias, but somewhat worn; Mr. Tudgey second with smaller and much fresher specimens; and Mr. West, gardener to S. Smith, Esq., Headingley, third; Cyathea Smithii and fine examples of Polystichum coriaceum and Goniophlebium subauriculatum being noticeable. An extra prize was worthily awarded to Mr. Eastwood, gardener to F. W. Tetley, Rsq., Westwood, his plant of Cibotium Schiedei having a spread of upwards of 15 feet. In the class for three plants the prizes went upwards of 15 feet. In the class for three plants the prizes went to Messrs. Winterbourne, Wright, and Tudgey in the order named, all exhibiting well. Mr. Rylance, Aughton Nurseries, Ormskirk, was far ahead of others with twelve hardy Ferns, and secured the first prize with excellent specimens; Mr. Goodchild, gardener to Mrs. Naylor, Potternewton, following with creditable examples.

PELARGONIUMS.—These as arranged on low stages round the sides of the tent devoted to them had a rich effect, the specimens sides of the tent devoted to them had a rich effect, the specimens affording evidence that there are skilful cultivators in the north, the plants being of good form and mostly good in foliage and blooms. The open class for twelve show varieties was a fine one, the prizes being awarded to Mr. H. May, Messrs. Lazenby and Sons, and Mr. Rylance respectively. In the amateurs' class for six plants, the prize plants, and excellent they were, came from the gardens of W. L. Joy, F. W. Tetley, and T. Simpson, Esqrs. Mr. Tetley's gardener was also first for Fancies, followed by Mr. Rylance and Messrs. Lazenby & Sons, all staging admirably; and Zonals were splendidly exhibited by Mr. Joy's gardener (Mr. G. Winterbourne), his brother (Mr. T. Simpson's gardener) and Mr. Hemming. As the names of the best varieties in the Pelargonium classes at the York Show were given in our report last week it is not necessary to repeat them here, as they were much the same not necessary to repeat them here, as they were much the same at both exhibitions.

Orchids, which were staged in much larger numbers and also Orchids, which were staged in much larger numbers and also in better condition than last year, occupied the whole of one side of the fruit tent. In the open class for six plants Mr. Mitchell, gardener to Dr. Ainsworth, Manchester, won first honours with Cattleya Mendeli, nine flowers; Odontoglossum crispum, five fine spikes; Cypripedium Parishi, nine fine spikes, most of them with three flowers; C. barbatum; Saccolabium præmorsum, with five pendulous spikes; and Thunia Bensonæ. Mr. Sunley was an excellent second, closely followed by Mr. Rollisson, gardener to Walter Bateman, Esq., both exhibitors staging very creditable collections. In the class for three plants Mr. Mitchell was again in the foremost position with a splendid example of Aërides maculosum Schroederi with five spikes, four of them much branched. culosum Schrederi with five spikes, four of them much branched, of large and richly coloured flowers, the plant very healthy and of large and richly coloured flowers, the plant very healthy and vigorous; Cattleya Mossiæ and Dendrobium crassinode completed the trio. Mr. Sunley was second, and Mr. West third; some of the Oncidiums being tied much too closely quite spoiling their appearance. In the single specimen class Mr. Mitchell was once more in the ascendant with Phalænopsis grandiflora aurea with twenty-four fine flowers; Mr. Hemming, gardener to H. Oxley, Esq., being an excellent second with a splendid example of Cypripedium barbatum with about sixty flowers; and Mr. H. Wright,

gardener to G. Talbot, Esq., third with Stanhopes tigrins with two vigorous spikes and three grand flowers expanded.

Azaleas were not noticeable, Calceolarias fairly good, Tuberous Begonias comparatively poor, Fuchsias creditable, but not superior, yet as arranged down the the centre of the fruit tent had an elegant appearance; Gloxinias very good from Mr. Sunley and Mr. Backhouse, gardener to Dr. Gott, Woodsley House, Leeds; and Lilium auratum very small.

Roses in rous were tolerably numerous and several of them

and Isliam auratum very small.

Boses in poss were tolerably numerous and several of them
very good. In the open class for twelve plants Mr. H. May
was placed first with large but too closely tied specimens; Mr.
Pybes, Menokton Moor, Ripon, an excellent second with smaller
plants, but having better foliage and blooms; and Mr. Rastwood
third with dwarf fresh apecimens. In the amateurs' class for six plants Mr. H. Wright was, we presume by mistake, placed first, the second-prize plants from Mr. Kastwood being decidedly superior both in habit, blooms, and foliage; Mr. Christopher Dalton, Ripon, had the third honours. The other classes do not call for

notice.

Of bedding plants we never saw better collections staged than those of Mr. Asdrew Simpson, Hewerth Nurseries, York, and Mr. B. Simpson, New Lane, Selby, who were awarded the prizes in the order named. The plants, which were in pans, were fine masses upwards of 2 feet in diameter, very fresh and bright, especially Coprosma Bauerians variegats, Ophiophogon spicatum aureum, Celeus Garnet, Abutilon Darwinii tessellatum, Lobelia pumila magnifica, Verbenas in variety, Ageratum Cupid dwarf and good, and succulents. These formed quite a pretty line along the sade of the tant.

of the tent.

of the tent.

Cut flowers were generally good, a few particularly so; but the fixture was too early for Roses which, as exhibited by Messrs. Canastan and Paul, Mr. Soames and others, were such a fine fasture of the Show last year. This year several boxes were staged; the blooms having mostly been out from under glass, and although good in their way do not call for a detailed notice. Stove and greenhouse cut flowers were admirably exhibited by Messrs. Cole, Sunley, and Letts. Fine trusses of Zonal Palargeniums were staged, and a few bomes of Pansies. The prises in the classes for the master ermanentally filled stand of flowers for the table, also for bridal and ball bouquets, were given by the Mayoress of Leeds the most eramentary much stand or newers for the table, and for bridel and ball bouquets, were given by the Mayoress of Leeds (Mrs. Addyman). The first prize in each class was well won by Mr. Wright, gardener to G. Talbot, Esq. The stand was most elegantly filled, there being a total absence of crowding, the feature of the decoration being the sprays of Clematis which were discreted with a return war who had wired discreted with a return war who had wired. feature of the decoration being the sprays of Clematis which were disposed with a natural gracefulness that was much admired. The second-prize amangement of Mr. R. Simpson was also most chiggast. If a few heavier flowers had been employed at the base the Judges would have had great difficulty in deciding on the respective merits of the two stands; as it was, the second-prize stand found the most favour with many critics, but the Judges' verdict was undoubtedly correct. The first-prize bridal bouquet was the best we have seen this year: it was neither too flat nor tas crowded, but almost every flower could be seen to advantage. White Lapagerias, Tabernsmontanas, Paneratium fragrans, with a few sprays of Guange blossom in the centre, and one or two of the deuble Destria incar the margin, and Ferns, were arranged with cancummants taste, the Paneratiums especially being very effective. In the ball bouquet a few sprays of Forget-me-not and small Ousidiums were associated with the flowers named. Many other bouquets were good, but generally too crowded.

The display was more noticeable for good quality than for magnitude. With the exception of a few Grapes that were not quite ripe scarcely a dish of fruit was staged that was not highly creditable to the exhibitors; and taking this section of the Show altegather we must pronounce it decidedly above the average. Six collections of six dishes were staged; Mr. Bannerman, gardener to Lord Bagot, Bugely, securing the first position with a good and well-ripened Pine, excellent Black Hamburgh, and full but not quite ripe Muscat of Alexandria Grapes, a fine Trentham Hybrid Melon, and capital dishes of Brown Turkey Figs and Royal George Peaches. Mr. Clarke, The Gardens, Stadiey Reyal, Bipon, was an excellent second with a grand basket of James Veitch Strawberries, full and fine but not perfectly ripe Golden Champton Grapes, an exsellent Royal Ascot Melon finely netted, Veitch Strawberries, full and fine but not perfectly ripe Golden Champion Grapes, an essellent Royal Ascot Melon finely netted, and superior dishes of Dr. Hogg Peaches and Lord Napier Neoterines. Mr. Pratt, Hawkstone, Salop, was third with large but not quite ripe Grapes, good Peaches, Melon, and Strawberries, and a small Pine. Hive collections were also staged in the class for four dishes; Mr. Clayton, gardener to J. Fielden, Eeq., Grimstone Park, Ulleskelf, securing first honours with a Pine, Melon, Black Hamburgh Grapes, and Peaches, all excellent. Mr. Letts, gardener to Lord Zetland, was a rather close second, and Mr. Bannerman third. In the class for three bunches of black and three of white Grapes Mr. Bannerman had the premier position with Black Hamburgh and Foster's Seedling, large and fine. Mr. with Black Hamburgh and Foster's Scedling, large and fine. Mr. Wallis, gardener to Sir H. S. Thompson, Kirby Hall, York, being second with very good Black Hamburghs, a little wanting in colour, and equally fine Golden Champions. Mr. Thompson, gardener to

G. Paget, Esq., Transfield Lodge, Guisley, was third with very large examples of Black Hamburgh and Muscata, but not quite ripe. Mr. Johnson, manager to Mrs. Noble, Boston Spa, Lincolnlarge examples of Black Hamburgh and Musoats, but not quite ripe. Mr. Johnson, manager to Mrs. Noble, Boston Spa, Lincolnshire, was placed first for a single bunch of Black Grapes with medium-sized, full, and wall coloured bunch of Black Hamburgh, but containing some small berries. Mr. Bannerman was a close second with much finer berries but not quite so black; and Mr. Mann, gardener, St. Vincents, Grantham, third—fine but not quite ripe. In the corresponding class for white Grapes Mr. Bannerman was first with fine Foster's, and Mr. Wallis second with Chasselss Musqué. The heaviest bunch class contained nothing noteworthy. Mr. Mann won the chief prize with a bunch of Black Hamburgh of 3 to 4 lbs. In the single Pine Apple class the prizes went to Mr. Miles, gardener to Lord Carington, Mr. Clayton, and Mr. Bannerman in the order named, all staging good and well-riponed fruits. Peaches were fine throughout, the first grizes falling to Mr. Sutton, gardener to H. Bentley, Esq., Eshald House, Woodlesford, for a fine dish, unnamed but resembling Bellegande; the second to Mr. Bannerman with Royal George, and the third to Mr. Wallis with Grosse Mignonne. Nectarines were rather small, and several not thoroughly ripe. Mr. Miles and Mr. Mann secured the prizes with Rirage. Melons were of good quality, and very equal in point of merit. Mr. Pratt secured the first prize with Trentham Hybrid, Mr. Miles the second with Victory of Bath, and Mr. Clark being first with Castle Kennedy, Mr. Frankland second, and Mr. Bannerman third. Mr. Miles was, as usual, placed first for Cherries with Black Circassian, followed by Mr. Wallis with for Cherries with Black Circassian, followed by Mr. Wallis with Mr. Clark being first with Castle Kennedy, Mr. Frankland second, and Mr. Bannerman third. Mr. Miles was, as usual, placed first for Cherries with Black Circassian, followed by Mr. Wallis with May Duke. Strawberries call for no comment, nor do the Vines and fruit trees in pots; but the first-prize Vine—a Black Hamburgh with seven good bunches—with which Mr. Walker, gardener to J. S. Taylor, Req., Apperly, Leeds, secured the first prize, was a creditable example of cultivation. Cucumbers were tolerably numerous and generally of good quality, but as few of them were named they must be passed without further notice.

There was an excellent display of horticultural structures from Messra, Halliday & Co., Middleton, Manchester.

It is a source of much regret that the incessant rains of the last two days of the Show necessarily limited the attendance considerably; but undoubtedly the Exhibition would have been

considerably; but undoubtedly the Exhibition would have been largely patronised had the weather been even of a moderately favourable character. Those who labour so assiduously in promoting the Show deserve success, for the object of both the Secretary and the Committee is to improve the horticulture of the distary and the Committee is to improve the hornculture of the district; and the countenance and active aid given to the Committee by the civic dignitaries should incite a generous support on the part of the public, and so render the Leeds Show one of the best provincial exhibitions in England. The arrangement and general management of the Show were, as usual, efficiently carried out by Mr. Billbrough.

FRUIT PROSPECTS IN THE SOUTH OF IRELAND.

THE great hopes we entertained with regard to a plentiful fruit crop some three or four weeks ago have been considerably blighted. Never did we see fruit trees of all kinds bloom so profusely as in the past spring, and fruit set in abundance, but the heavy storms of hail which we experienced from the 8th to the 25th of May left their marks on fruit trees in general for this season.

Apples.-In some cases there are moderate crops. Thos Index.—In some cases were are moderate crops. Those is find to bear best this year are King of the Pippins, Cox's Orange Pippin, Blenheim Orange, Kerry Pippin; those I consider to have three parts of a crop, while many other varieties of dessert Apples are fruitless. Baking Apples are also poor with the exception of a few varieties—viz., Ecklinville, Lord Suffield, and Warner's King, the latter bearing a few varieties—viz.

Pears.—Standard trees have a very light crop, but those on walls are bearing pretty well. The varieties likely to bear best this season are Beurre Giffard, Beurre Diel, Beurre Superfin, Williams' Bon Chretien, and Louise Bonne of Jersey.

Plums are moderately abundant. Prince of Wales, Orleans, Green Gage, Coe's Golden Drop, and Magnum Bonum are among the fruitful of this season.

Cherries have a very light crop now, although two weeks ago they wore a very cheering appearance, but having since then shed three-fourths of the young fruit they are consequently

Posokes.—There is a fair prespect of a crop out of doors if we get some warm weather, as the fruits are swelling rapidly and the trees are comparatively free from aphides and also leaf blister this season.

Bush fruit is in some cases very light. Gooseberries have only half a crop, Currants about the average, Raspberries also bear a fair crop. Strawberries are very good, Keens' Seedling, President, Sir Joseph Paxton, Dr. Hogg, and the Amateur are

ANDREW CAMPBELL, Muchross.

MAIDSTONE ROSE SHOW.

I LITTLE expected when I drove up from the station at Maidstone to the skating rink, where the Rose Club held their Exhibition, to find such a collection of Roses as was there exhibited. bition, to find such a collection of Roses as was there exhibited. I knew it was a favoured locality, and that honest John Holling-worth's garden was especially favoured, but I did not think at this dreadful season that even there it would be possible to show Roses worth looking at. It may, then, surprise the readers of the Journal to be told that a finer box of eighteen I never saw shown than that with which Mr. Hollingworth won the cup, the Teas especially in it being magnificent. These were all cut from the open air, and fully justify all that I said about his Rose prospects. Before these lines are in type the National will have been held, and I shall anxiously look to see what place he takes.

Before these lines are in type the National will have been held, and I shall anxiously look to see what place he takes.

Let me give, then, the names of his flowers. Madame Bravy, a splendid bloom of great substance and very full; Ernest Boncenne; Souvenir d'un Ami, a lovely bloom; Duchesse d'Ossuna; Madame Willermox; Maréchal Vaillant, fine; Pierre Seletzki; Duke of Edinbergh, very bright; Duchess of Edinbergh; Le Volupté—this was what the beys call a stunner. Does anybody know it? I reusember seeing the name in catalogues years ago, but cannot find it now. I hope that the bloom may be kept sufficiently fresh to show at the National. It is of a lovely shade of cream and fawn, of great substance and large petals. It obtained the silver medal of the National Rose Society for the best Rose in the Show, the bronse medal being awarded to Madame Bravy before mentioned)—Jules Margottin, Therèse Levet, John Hopper, Maréchal Riel, Madame Hector Jacquin, Cheshunt Hybrid, Belle Lyomnaise,

medal of the National Rose Society for the best Rose in the Show, the brosse medal being awarded to Madame Bravy before mentioned)—Jules Margottin, Therèse Levet, John Hopper, Maréchal Riel, Madame Hector Jacquin, Cheshunt Hybrid, Belle Lyomaise, and a grand bloom of Charles Lawsen. The box of twelve Teas which won the first prise was also exhibited by Mr. Hollingworth, and contained fine examples of Madame Bravy, Maréchal Niel, Souvenir d'Elise, Madame Maurin, Belle Lyomaise, Josephine Malton, Marie Van Houtte, and Devoniensis.

Perhaps the prettiest box in the Show was that of the six Teas exhibited by Mrs. Green, containing lovely examples of Souvenir d'an Ami, Josephine Malton, Maréchal Niel, Devoniensis, Catherine Marmet, and Radame Sertot. In the class for twelve varieties Mr. Wakeley of Rainham was first with Abbé Bramerel, a fine flower; Malle. Eugénie Verdier, Charles Lefebvre, Marquise de Castallame, Comtesse d'Oxford (very fine), Maurice Bernardin, Edenard Morren, Exposition de Brie, Henri Ledechaux, Capitathe Christy, Camille de Bohan, and Souvenir d'un Ami; the Rev. E. B. Biron, the energetic Secretary of the new Rose Society recessity established at Canterbury, being a good second. In the class for twelve blooms, six Hybrid Perpetuals and six Teas, Mr. Elollingworth and Mr. Wakeley were equal first. Mr. Hollingworth's flowers, Comte de Brabant, Madame Maurin, John Hopper, Belle Lyonnaise, Madame Bravy, Duchesse d'Osuna, Maréchal Vsillent, Marie Van Houtte, Souvenir de Dr. Jamin, Allemand, Madame Hector Jacquin, and Madame Willermoz. Mr. Wakeley's Mewers were Mille. Eugénie Verdier, Abbé Bramerel, Gloire de Dijon, Maurice Bernardin, Henri Ledechaux, Marie Van Houtte, Mille, Annie Wood, Souvenir d'un Ami, Céline Forestier, Jules Masgottin, Bewquet d'Or, and Cheshuut Hybrid. The prise for the best six of any variety was won by Maréchal Niel; the second going to Mr. Hubbert Bensted for a beautiful box of Nareisse large Margettin, Beaquet d'Or, and Cheshunt Hybrid. The prise for the best six of any variety was won by Maréchal Niel; the second going to Mr. Hubert Bensted for a beautiful box of Narcisse large and clean. In the class for six there were seven entries, Mrs. Green taking first with Alba Bosea, Maréchal Niel, Anna Alexieff, Dulze of Bdinburgh, and Comte de Paris.

This, the first show that I have attended this season, confirms

the opinion formed by many rosarians, that when it does really spen the queen of flowers will come forth in grand form. In the meantime most societies are putting their exhibitions back a week.

—D., Deal.

NOTES AND GLEANINGS.

THE EVENING FETE to be held in the gardens of the Boyal Horticultural Society on Wednesday next, July 9th, promises to be one of unusual interest. The Roses and Pelasgeniums staged on the preceding day will continue on view, and various systems of electric lighting will be displayed. The Conservatory and the Flower Show tents will also be brilliantly illuminated. As the members of the International Telegraph Conference now being held in London will be present, every effort is being made to render this occasion one of the completest exhibitions of open-air electric lighting ever seen. The whole of the arcades, quadrants, and exhibi-tion tents will be connected and lighted, so that in the event of wet weather it will be possible to walk entirely round the gardens under cover. There will be a large and interesting display of electrical, galvanic, and other scientific instruments, including Mr. Edison's lond-speaking telephone, phonographs, microscopes, &c., with demonstrations. The bands of the First

the varieties I grow, all of which are well set with fruit. | Life Guards and of the Horse Guards (Blue) will perform be combined upon the upper terrace. The members of the Lombard Amateur Musical Society will sing glees, esc., in the open air and in the Conservatory.

WE are informed by a correspondent that some of the successful exhibitors at the ROYAL BOTANIC SOCIETY'S SUM-MEE SHOW in 1878 had not received their prise meney on the 27th of June, 1879. Our correspondent asks, "Why the Secretary pays some of the exhibitors at the commencement of the new year and keeps others waiting for months aftar-wards;" and further observes that "a Society of such pretensions and patronage ought to clear their liabilities sooner with those to whom they are indebted for making the shows. Many exhibitors have to pay ready money for the carriage of their plants, and they feel it hard to have to wait more than twelve months for their prise money. Provincial societies recognise this fact, and many of them pay the prize money within a few days of the exhibitions."

—— A CEETAIN Dr. Bretschneider, who hails from the Bussian Embassy at Pekin, states seriously in Regel's "Gartenzeitung" that the Chinese raise WEEPING TREES by reversing their extremities! We have many a time put on grafts upside down to see what the effect would be on the direction of growth, and as a matter of course the growing axis was always turned in an upward direction. Dr. Bretschneider might as well say that a seed planted in the ground with the plumule downwards would throw its roots in the air.

——AMONGST recent gardening appointments we learn that Mr. WILLIAM STAPLES, late gardener and steward to the Hon. Cecil Duncombe, Newton Grange, Newton, has obtained an appointment at Gorton, Cambridge, Auckland, New Zealand. Mr. Charles Hoskyns, late gardener to C. Wingfield, Esq., Onslow, Shrewsbury, has been appointed gardener to George Wilder, Esq., Stanstead Park, Emsworth, Hants, succeeding Mr. Clarke in that position, Mr. CLARKE having become gardener to Sir Gilbert Clayton East, Bart., Hall Place, Maiden-

- WE are informed that the NATIONAL ROSE SOCIETY'S NORTHERN EXHIBITION at Manchester has been POSTPONED until July 19th, and the Oxford Rose Show is to be held on the 15th of July, and not on the 16th as stated at page 478.

RECOGNISING the valuable services of Mr. JOHN WILSON, the able Secretary of the York Floral Fête since its establishment twenty years ago, the exhibitors and admirers of the shows are raising a subscription for presenting Mr. Wilson with a testimonial as a mark of esteem for his labours in connection with the events that have afforded so much estisfaction to the inhabitants of the city and neighbourheod.

— WE have received a plate of a NEW SEEDLING AZAZZA Madame Jean Nuytens Verschaffelt, raised by M. Jean de Kneef. As represented in the plate the variety is one of great beauty. The flowers exceed 4 inches in diameter, are flat and nearly oricular. The flowers are white faintly tinted with rose, with a slight yellow blotch on the upper petals, this blotch, however, fading to white. The petals are waved but not crimped, and the foliage and habit of the plant are described as all that can be desired. Plants will be distributed during the ensuing autumn by M. Jean Nuytens Verschaffelt of Ghent.

- A CORRESPONDENT, "TWEEDSIDE," informs us that there is at present to be seen growing in the open ground in the garden of Mr. Andrew Bialtie, Newtown Street, Dunse (Berwickshire), a plant of LILIUM MONADELPHUM SZOVITZIANUM in full flower. It is 6 feet in height, and has twentynine stalks and 247 flowers. The greatest number on one stalk is fifteen.

- THAT fine collection of ORCHIDS, the property of — THAT fine collection of ORCHIDS, the property of O. O. Wrigley, Esq., Bridge Hall, Bury, was recently sold by Mr. J. C. Stevens, there being 1194 lots, and the sale occupied four days. The following are some of the principal prices realised: — Cypripedium Stonei, 21 guineas; C. caudatum, 8½ guineas; C. Veitchii, 15 guineas; C. lævigatum, 10 guineas; Calanthe veratrifolia, 10½ guineas; Cattleya aurea, 12 guineas; Vanda tricolor, 16 guineas; Odontoglossum pulchellum, 11 guineas; Saccolabium præmorsum, 12 guineas; Anguloa Clowesii (figured on page 70, vol. xxxv.), 22 guineas; Cælogyne cristata, 13½ guineas; Odontoglossum vexillarium roseum, cristata, 13½ guineas; Odontoglossum vexillarium roseum, 7½ guineas; Vanda suavis, 15½ guineas; Masdevallia vexillarium, 14½ guineas; M. tovarensis, 9½ guineas; Lycaste Skinneri alba, 36 guineas; Masdevallia Harryana sanguinea, 25 guineas; M. Veitchiana, 14½ guineas; Anthurium Schertzerianum, 28 guineas. The total amount realised by the sale was £2304.

· In consequence of the lateness of the season the NATIONAL CARNATION AND PICOTEE SOCIETY'S SOUTHERN SHOW has been postponed from July 22nd to August 12th. It will be held in the Royal Horticultural Gardens at South Kensington.

- A CORRESPONDENT, "E. P. N.," informs us that in the Deanery garden at Canterbury is a good-sized specimen of the PAULOWNIA IMPERIALIS raised by the present Dean from seed ripened in the rectory garden at Eweline. Our correspondent also states that when he was at Montpellier in the spring of 1855 he saw in the Botanical Gardens there a fine specimen covered with large bunches of its beautiful lilac blossoms; and further observes that what adds to the beauty of the flower is the peculiar woolly brown calyx. The tree referred to was at least 18 inches in diameter.

A CORRESPONDENT sends us the following extract from "Chambers' Journal" relative to STRAWBERRY FARMING IN SCOTLAND. "Strawberry farming on an extensive scale has been going on for some time in Scotland. On the Muir of Blair, an extensive tract of land lying between Blairgowrie and Coupar-Angus, there is a community of about seventy-five Strawberry farmers who earn a living for themselves and families at the business of Strawberry growing. The fruit is usually sold en masse to the preservers; and in some years as much as £46 an acre has been realised by the sale, but the average income from a Scottish Strawberry farm is seldom more than £27 an acre."

THE OLD YELLOW ROSE.

By the same post we received two inquiries relative to this Rose. "E. A." wished to know where it is to be obtained, and a "YOUNG NURSERYMAN" desired to know to "what Rose the term 'old' properly applies." Perhaps some of our correspondents can answer the former query. This Rose is, we suspect, scarce; but it is not lost, for, if we mistake not, it was exhibited at South Kensington last year under the modern name of Burghley Yellow. The "old" yellow Rose is Rosa sulphurea, and it is worthy of its prefix "old," for it has been cultivated in England for upwards of 250 years. This is evident, since it is minutely described by Parkinson in his "Paradisus," which was published in 1629. The old author's

description is so quaint yet so particular that we reproduce it.

"The double yellow Rose is of great account, both for the rarity, and doublenesse of the flower, and had it sent to the rest, would of all other be of highest esteeme. The stemme or stocke, the young shoots or branches, the small hairy prickes, and the small winged leaves, are in all parts like vnto the former single kinde; the chiefest difference consisteth in the doublenesse of the flower or Rose, which is so thicke and double, that very often it breaketh out on one side or another, and but a few of them abiding whole and faire in our Countrey, the cause thereof wee doe imagine to bee the much moisture of our Countrey, and the time of flowring being subject to much our Countrey, and the time of flowring being subject to much raine and showers; many therefore doe either plant it against a wall, or other wayes defend it by couering; againe, it is so plentifull in young shootes or branches, as also in flowers at the toppe of every branch, which are small and weake for the most part, that they are not able to bring all the flowers to ripenesse; and therefore most of them fall or wither away without comming to perfection (the remedy that many doe vse for this inconvenience last recited is, that they nippe away most of the hads leaving but some few youn it, that so the most of the buds, leaving but some few vpon it, that so the vigour of the plant may be collected into a few flowers, whereby they may the better come to perfection, and yet euen thus it is hardly effected) which are of a yellowish greene colour in the bud, and before they be blowne open, but then are of a faire yellow colour, very full of leaues, with many short haires rather than leaves in the middle, and having short, fround, greene, smooth buttons, almost flat vnder them: the flower being faire blowne open, doth scarce giue place for largenesse, thicknesse, and doublenesse, vnto the great Prouence or Holland Rose. This Rose bush or plant is very tender with vs here about London, and will require some more care and keeping then the single of this kinde, which is hardy enough; for I haue lost many my selfe, and I know but a few about this towne that can nourse it vp kindly, to beare or

scarce to abide without perishing; but abideth well in every free aire of all or the most parts of this Kingdome: but (as I heare) not so well in the North.

"The double yellow Rose, first was procured to be brought into England, by Master Nicholas Lete, a worthy Merchant of London, and a great louer of flowers, from Constantinople, which (as wee heare) was first brought thither from Syria; but perished quickly both with him, and with all other to whom hee imparted it; yet afterwards it was sent to Master Iohn de Franqueuille, a Merchant also of London, and a great louer of all rare plants, as well as flowers, from which is sprung the greatest store, that is now flourishing in this Kingdome."

The term "sulphurea" does not sufficiently represent the colour of the flower, which is almost as bright as the yellow Crocus. Even if it is scentless it is nevertheless desirable that this distinct old Rose be increased, as it is the brightest and

fullest of all yellow Roses.

FARNINGHAM ROSE SOCIETY'S SHOW.

THE valley of the Darent has long been known to Londoners, not only for its rich pastoral beauty, but as a favourite resort for the disciples of Isaac Walton. Amongst the villages that nestle the disciples of Issac Walton. Amongst the villages that nestle around its banks none are better known and appreciated than the village of Farningham; and the old hostelry of the "Lion" has many pleasant memories in the recollections of those who have followed the gentle art. Happily the ruthless hands of modern improvers have not reached the village; and one can hardly fancy that within seventeen miles of London a place can exist so utterly unchanged from the quiet village of the last century. The inhabitants have managed to keep the railway from them; and although it is within two miles of three stations, that foe to all rural beauty and destroyer of all sesthetic ideas has not come near. Here no staring rows of red-brick abominations, no cockney villas or flaring "publics" are to be seen; and its quaint old houses and lovely surroundings can be thoroughly enjoyed by all who love the unique character of English pastoral scenery.

Here, then, some lovers of the Rose determined to start a Society

Here, then, some lovers of the Rose determined to start a Society for the special encouragement of their favourite flower. Happily for them, they determined that its first exhibition should not be dependant on the Rose, but added prizes for greenhouse and other plants, cottagers' productions, &c. It was well that they did so, for in this most disastrous of all seasons that we have ever known for the Rose they have been simply obliged to postpone their show until the 8th of July, and hence the Exhibition held to-day (June 24th) was confined to the greenhouse plants and table decorations. I think it is not often that in so quiet and retired a country place such collections of foliage and flowering

table decorations. I think it is not often that in so quiet and retired a country place such collections of foliage and flowering plants are brought together as were shown here from the gardens of Messrs. Spottiswoode, Mildmay, &c.

Fine specimen plants of Clerodendrons, Stephanotis, and Tree Ferns were exhibited that might very well have done duty at a metropolitan show, while the arrangement of groups of plants was excellent. There was one tent which might well furnish a pattern and give a lesson to many exhibitions. The centre of it was arranged for exhibitions of miscellaneous plants grouped for effect; the plants were not large, and the stage was not more than one foot from the ground; hence the eye took in, not a quantity of pots, but the whole effect of the foliage and flowers, while it had an advantage which groups resting on the ground are deficient in — viz., that of bringing the plants nearer the eye. The table decorations and bouquets were arranged around the sides of the tent, and some of them were of considerable merit, that which obtained the first prize especially so. Another arrangement was made here which could not be done in many places. The valley is well known for its paper mills, some of our best brands coming from it. Well, a large roll of endless carridge about 6 feet wide was brought direct from one of the mills to the tent, and according as it was wanted strips were cut off to cover the staging, giving the appearance of beautiful white table linen, while after the Exhibition it would be all collected again and returned to the mill to be used up.

The Exhibition was held in a very heantiful meadow belonging.

and returned to the mill to be used up.

The Exhibition was held in a very beautiful meadow belonging to Mr. Rasleigh, surrounded by stately Elms of great beauty; and although nothing could have been more deplorable than the appearance of the morning, rain falling in torrents, yet about eleven it all cleared off and a lovely afternoon with bright sunbrightened up everything, not the least the spirits of their inde-fatigable Secretary Mr. Burnside and a hard-working Committee, who had done their best to make it a success, who must have been

most gratified at the result.—D., Deal.

CERASUS VIRGINIANA.

SOME years ago there was a tree growing in one of the belts on the south boundary of the old Chiswick Garden which attracted the attention of lovers of trees when it was in bloom

and which was erroneously labelled Cerasus capollin. That it was not Cerasus capollin was evident from the broad oyate In coolate leaves and the bold erect leafless racemes of flowers.

It was a tree which engaged Loudon's notice, and in the whole tree bear so much resemblance to C, virginiana that "Arboretum et Fruticetum Britannicum" he remarks, when treating of Cerasus capollin, that the flowers produced on a but of larger and more luxuriant growth,"

plant bearing this name in the London Horticultural Society's Garden are not those of that species. "Its leaves also are

Of the tree thus referred to we furnish our readers with a representation; at the same time we do not consider it the Cerasus virginians of Michaux, neither is it the Cerasus Padus of Decandolle as some have supposed it to be. After a careful examination we have come to the conclusion that it is the true Prunus virginians of Linnsus, and the Prunus Cerasus rubra of the "Hortus Kewensis," ed. 1. It differs from Cerasus Padus in the habit of the tree, which is stronger and more

rigid and luxuriant; in the glandular leaves, those of C. Padus-

"BE not the first by whom the new is tried, Nor yet the last to lay the old aside."

THIS motto, which is not unsuitable in many of the transactions of life, would seem to be often commendable in flori-culture, especially when considering perennial, herbaceous, and border plants. Correspondents and visitors too often when visiting gentlemen's residences and noting what they consider deserving, frequently overlook those old and modest plants for the more brilliant but less durable annuals and bedders. I have, in company with the head gardener at Minella, visited this picturesquely situated residence, and was kindly shown over it by the courteous owner, Benjamin Foyle, Esq., J.P., and shall copy a few notes on perennials and border plants then taken, together with some brief observations on ornamental shrubs and trees, which, remembering the inquiries frequently made in the columns of the Journal, cannot fail to intérest many readers.

HERBACEOUS PLANTS.— Iries.—The blue I. germanica is now fading, but there are fine specimens of the white aphylla and amoens. They are rarely met with, but form a splendid contrast with different plants to be mentioned presently. A little mulching or top-dressing once a year is about as much

care as they require.

Liliums, &c.—Besides these ordinarily grown, such as varieties of L. tigrimum, the old Turk's Cap; L. albanium and its varieties, luxuriate and are now opening has bloom. Ornithogalum (Star of Bethlehem), and some dwarfer kinds peep out from beneath bright blue Periwinkles, Convallaries, Ambe-

ricum liliastrum, &c.

Paonies.—Why those great crimson heads of P. tesuifolia fl.-pl. are not to be found in every flower header does often surprise me. P. anamonsolom, though smaller, is even more brilliant and curious. They require no farther attention except a little protection from suring frosts which a well-arranged shrubbery border affords, and some top-dressing. If not more observable brilliant, much more conspicuous and chaste in colour was a fine Tree Passay, Passaia Moutan resulters. It certainly looked a splandid object, literally a mass of fine pale rose flowers. We were curious enough to count the flowers, and they numbered nearly two hundred. It was not much ever 4 feet high and as many through.

A feet high and as many through.

Acanthus latifolius.—The fine glossy leaves of this ernamental plant, which retain their variant palish for ten months out of every twelve, would grace any border, and may fairly be compared with that more recent introduction from the Cape. Stobæa purpurea, which it resembles. It does not like removal, requires no care, and does well as at Merlin in a surre

nook by a south wall.

Tritoma.—I might have included these among the Lilium group, but they are very distinct. T. grandis would seem to de better here than the more common scarlet T. Uvaria. Neither would seem, notwithstanding the elevated situation, to have suffered as severely as in other places from the winter and spring frosts. They are fine autumn plants, and, like those already named, requiring neither housing, wintering, or transplanting. They look fine overtopping low evergreens or small herbaceous plants, when their great scarlet poker-like heads at once arrest the eye, or when associated with the feathery Gynerium (Pampas Grass).

Papacers.—If Tritomas and Pæonies are conspicuous in the mixed border, they are certainly in this respect exceeded by P. orientale, the great scarlet Eastern Poppy. No object will sooner arrest attention. They do best as here peering out from behind other dwarfer perennials, as their long stems are leafless, and in this respect differ from the crimson P. bracteatum.

Salvia candidissima (the White Salvia).—The peculiar glaucous silvery foliage of this fine plant should entitle it to a place in every border or bedding collection. The flower is not showy but still very curious. A fine specimen was in bloom

in the greenhouse.

Double Rocket (Hesperis matronalis alba fl.-pl.).—Any person who has seen those sweet-scented tall-growing flowers in company, say, with Campanula pyramidalis, the Rockets, Larkspurs, Lapines, and the deep blue Delphinium formosum, or blue Salvia patens, would instantly resolve to have them at

ORNAMENTAL TREES AND SHRUBS,-The Arber-Vite is

beauty at Stillyans in Sussex, the new residence of Lady Dorothy Nevill.

There is nothing finer than the variegated Thuja delebrata. A few fine healthy young specimens are doing well at Merlin, and contrary to the accepted theory of elder times they are perfectly hardy, and have escaped last winter quite unscathed. They were formerly grown in the greenhouse, and would when small be very ornamental.

Mistletoe.—This is often inquired about. Mr. Foyle has it growing on the Mountain Ash, the Hawthorn and the appearance of the merely attaches the glutinous berries, when the seeds are fully ripe, to a slit in the younger wood and protects them from birds. They thus grow and form curious objects, being particularly welcome on festive occasions. growing on the Mountain Ash, the Hawthorn and the Apple.

Abelia horibunda.—A greenhouse evergreen shrub, but here it does remarkably well planted out against a protected south wall. It bears fine rosy-purple flowers in spring, and deserves

a further trial planted out.

Buostyptus globulus (the Australian Gum Tree), so much recommended as a preventive of fever miasma. A fine specimen was growing here on a south wall last year, but upon inquiries I find the last winter was too severe for it and it succombed, though in other places growing again from the old

Escallonia macrantha.—In many places this fine shrub was killed outright; here it grows on in rude health, possibly, as in many other instances thus noticed, owing to protection afforded against cutting March winds, by some large forest trees against cleaning march within, by some large forces against cleaning planted. The same observation is true of the Bays and Arbutus. I may here note that undermeath the Arbutus were fine young specimens of seedlings growing naturally from the self-sown berries, so that here, as in Killarney, this species grews naturally.

Engeniae.—E. apiculata flourishes here in the open ground,

though by no means generally hardy. It has suffered much less than many other members of the Myrtle family, Myrtus communis being killed down to the ground in almost every instance, though now slowly communing to make young

Aristolechie Sipha.—This curious American wall climber covers a distance of 10 feet hase. The flowers are of a pale green colour, and shaped like a measurehaum pipe. Mr. Foyle has rarely found a fertile seed, possibly owing to the difficulty of impregnation.—W.J. M., Otomesi.

CROYDON HORTICULTURAL SOCIETY.

JUNE 25TH.

DEMONITOR EDITION SOCIETY.

DEMONITOR EDITIONAL SOCIETY.

DEMONITOR THE STR.

Demonities rains all the morning preceded the opening of this Society's annual Exhibition, and the only wonder is that in the midst of anch unprepitions weather such a satisfactory display could have been collected together. The whole of the exhibits were arranged in one extensive marquee. Prizes were offered for groups of plants arranged for effect, both for single-handed gardeners and for gardeners who possess more convenience and aspliances for cultivating decorative plants, and some excellent collections were exhibited.

Rosse.—There was a far bester display of these than we expected to see, Mr. Penfeld obtaining first honours for twenty-four distinct; E. Mawley, Esq., the same for twelve varieties, which were very bright and clean. Mr. Orchard, gardener to F. W. Marris, Maq., was first for six of any variety, exhibiting splendid blooms of Cheshunt Hybrid; Mr. E. Mawley being second with the same variety; and Mr. Mawley also secured the first prize in the special class for twelve cut Roses with a seed box of Rubens, Dr. Andry, Madame Willermos, Cheshuat Hybrid, Caroline Kuster, Medame Margottin, Madame Bravy, Maréchal Riel, Souvenir d'un Ami, Globre de Dijon, and Marie Van Houtte. Mr. Orchard obtained the second place. Mr. W. Phys., Uckfield, Sussex, exhibited a very bright collection of twenty-feur, which included four varieties of Mr. Bennett's "new Hybrid Teas," and which we hope to see again during the season. Vicomtesse Falmouth as here exhibited was of the character of Cheshunt Hybrid, only a tride lighter. The Drobes of Connapart was very similar to Mdlle. we hope to see again during the season. Vicomtesse Falmouth as here exhibited was of the character of Cheshunt Hybrid, only a trifle lighter; Duchess of Connaught was very similar to Mdlle. Bugénie Verdier or Marie Finger; and the Hon. Charles Bancroft a shade darker rose than Charles Lawson, but possessing very much of that Rose's flat character. The most promising Rose of the four was decidedly Duke of Connaught, the colour a very

the four was decidedly Duke of Connaught, the colour a very pleasing crimson, but as exhibited small in size.

Stove and greenhouse plants were represented by three collections of large plants, which occupied a great space of the centre stage. Mr. King, gardener to Stephenson Clarks, Heq., Croydon Lodge, was awarded the first prize with massive and well grown plants. Mr. Penfeld and Mr. Fewell followed. In the class for six Mr. Clasff, gardener to C. H. Goshen, Esq., The Ballards, was an easy first, and also obtained the first prize for a single specimen flowering plant with Allamanda Hendersoni. Ferns were

numerous and good, and various other miscellaneous plants were well shown.

well shown.

The display of good fruit was very limited, but well finished Grapes came from Mr. W. B. Glossop, gardener to F. Banbury, Eaq., Shirley Park, who was awarded the first prise in each case. Several collections of vegetables were sent, but Mr. Chaff's were decidedly the best. One very interesting plant in this Exhibition was a very fine specimen of Lilium giganteum, quite 9 feet 6 inches in height, bearing ten most beautiful flowers. An extra prize was awarded. The display was altogether worthy of the district, and the Show was well attended in the afternoon. The Secretary (Mr. C. Roffey) is to be congratulated, and deserves much praise for his efforts in connection with this Society.

DICTAMNUS FRAXINELLA.

My experience differs from that of your correspondent Mr. R. D. Taylor in respect of the floriferousness of this species. I have now two plants (one with white, the other with pink flowers) that were planted eight years ago: the former now shows twenty-five, the latter twenty-one spikes of bloom, some stronger than others and not yet expanded, being quite a fortnight later this season than usual. They are growing in a partially shaded border of poor light soil, which is never disturbed, but has in autumn a top-dressing of leaves nearly decomposed, and in summer two waterings with diluted sewage from the house tank. The pink variety may, I think, be recommended as one of the most handsome of hardy perennial border plants, and owing to the neat and stout habit of growth no unsightly sticks are necessary for their support.—F. W., Abiagdon.

THE OLD MARKET GARDENS AND NURSERIES OF LONDON.—No. 24.

CLAPHAM, Wandsworth, and Batterses are three places in the seath-western suburbs of London which have a natural connection, though they present strong points of difference. When Lyons published his "Ravirons" in 1811 they might all have been appropriately designated "villages," for they were distinct from the great metropolis, and they were not of a size to be called "towns." These are situate upon and about the western end of a range of the Surrey hills to which we have already referred, and which stretch across an irregular space between the windings of the Thames from Greenwich to Battersea. The hills in this locality have received the names of Clapham Rise, Larkhall Rise, Lavender Hill, and Battersea se, but they are not now so definable as once they were owing to the houses, which have covered what was open country in the resollection of many living. From these hills flowed down in most seasons various little streamlets, which finally vanished in the Battersea marshes, and which were of utility to those gardeners who were not near the river by providing them with soft water. In several of the fields that are yet unbuilt upon we may see the Willows remaining which formerly luxuriated on the banks of streamlets now dried up or which have been filled-in. But Battersea, if it has less water on its surface, is undoubtedly better drained than it was, say thirty years ago, when in an epidemic of cholera some of these who worked in its market gardens were suddenly carried off; but still in healthiness it will not bear comparison with its neighbour Clapham, which by the returns is the most salubrious district of South London. The peculiarities which made Battera so suitable for the culture of Asparagus, Artichokes, and Melons do not tend to the benefit of humanity, however—that is, the low position on the river's bank with a moist subsoil.

Also, the neighbourhood abounds with smoke-emitting factories and chemical works. There does not appear to be any truth that Chelses and Batterses acquired the final syllable of their rasmes because the Thames at this point sometimes widened out into a miniature sea, but still the adjunct "sy," or "sey," had to do with their nearness to the river. It curiously illustastes how names undergo transformations, that, in the time of the Conqueror, Battersea was "Patrices,," not in any way connected with St. Patrick, however, for it was a part of the

property of St. Peter's, Westminster.

As in the instance of other suburbs, it would be a mistake to suppose that all, or almost all, the land that is covered with new streets was once market garden ground. Some of it had been attached to private residences, and there were many fields where eattle grassed, when London did not receive the balk of its milk supply from distant places. (By the way, one evil of this is, that it is very difficult to ascertain under what sanitary, or insanitary, conditions such milk is produced.) And

some acres of the land that was under cultivation were occupied with plants used for the winter food of cows. It was natural for those gardeners who in Stuart times were growers of vegetables for the London market on the extensive tract of land in Middlesex, near what were known as "The Neat-Houses," to glance across the Thames with a desire to enter upon the possession of the "sweet fields beyond the swelling flood;" and there seem to have been market gardens at Nine Elms and Battersea early in the eighteenth century. Railways were non-existent, and the Thames was for many years a handy means of conveying produce to Hungerford and Covent Garden markets. It is stated that several of the refugees from France and Holland, who had at first settled in Kent, migrated to Battersea and adjacent places on finding they could get a good sale for their vegetables and fruit, our English gardeners being far less skilful in some respects. The Wallrons, indeed, were at Wandsworth as early as 1583, but they chiefly employed themselves in manufactures, availing themselves of the water power of the river Wandle. In the Huguenot cemetery at East Hill, Wandsworth, quaintly called "Mount Nod," lie the remains of various refugees to whom, doubtless, English horticulture owes somewhat, but their histories have perished, though their tombs still record their names and ages.

The better class of market gardens and some orchards were on the higher ground towards Battersea Rise and Wandsworth. The name Lavender Hill, yet extant, may indicate that Lavender and other aromatic plants were formerly grown here before another Surrey district became so famous for them. Along the Clapham and Wandsworth Roads the nurseries were numerous in the early years of Her Majesty's reign, but many have disappeared, or they have lost nearly all their open ground, and receive their plants mostly from establishments in the country. Originated by the demands of an increasing popula-tion a still further increase has been unfavourable to them, because the land could be made to yield more in building leases; moreover, the air became too contaminated to allow of the culture of choice plants. That some acres about Nine Elms and Battersea, below the level of the Wandsworth Boad, have been spared by the builders arises from the proximity of railway works, the land being too unpromising for speculation, so that Cabbages and Lettuces are suffered to grow, though their appearance is suggestive of dyspepsia. A part of this ground—which once perhaps yielded Asparagus, Cucumbers, and Melons—is fenced round with a care that seems ludicrous, while other parts are open to the excursions of boys, cats, and dogs. The condition of some of the roads in Battersea suggests that the gardens hereabout were still in the habit of being sup-plied with manure from a distance, as an old history informs us was the case a century ago or more, but that a good deal of it was distributed *en route*. An illustration of the marshy character of the land is given by some patches that lie waste for the present, where Cotton-grasses and Mosses mingle with stunted self-sown vegetables, and Celery run wild struggles against overgrown Horseradish plants, with masses of straggling Marigolds throwing a yellow tint over the ridges. There are near Surrey Lane two fine Privet hedges, which must have been planted many years since, and which screened some of the garden ground, but the smoke of modern days is unfavourable to them.

Battersea Park occupies the larger portion of old Battersea Fields, which was formerly parish property, given to Battersea, so 'tis said, in consideration of kindness shown in the burial of a drowned man, and while some of the land was cultivated much of it was bare until the Park was commenced in 1852. The market gardeners are still at work in the outskirts of the park, but as the sites here are more eligible than in other districts of Battersea their ground is being diminished every year. Lastly, concerning Battersea we note that for a short time the late Mr. Knight had a nursery close to the Wandsworth Road, where about 12 acres were laid out in mathematical plots; of its name, "Brooklands," a reminiscence survives in a tavern called the Brooklands Arms.

If we pass up what used to be known as Pig Lane, and which intersected market gardens until ten years since, towards the higher ground in Wandsworth we find near the railway bridge Curland Nursery has a small extent of open ground attached to it, where evergreens and other plants struggle with some success against the smoke, but at the time of our visit the evergreens had evidently suffered from the severe winter—a common complaint. Less easily found in Priory Grove, near Larkhall Rise, is the nursery of Mr. F. Valler, formerly Valler & Son, apparently of about the same

date as most of the nurseries hereabout. There is little culture of plants except under glass, the remnant of its open space being now occupied by an iron church, so that if the occupier of the pulpit wishes to preach a "flower sermon" he can readily get illustrations. In the direction of London, fronting the Wandsworth Road, is the Springfield Nursery, established by Mr. Buxton, but now in the hands of Mr. Chard; and a few yards to the east is a place that bears the title of Springfield Watercress and Pleasure Grounds. The style of the tabel announcing that Cabbage plants were for sale seemed to indicate some antiquity. This is one of the few places where Watercresses are grown near London, and it set us wondering why, seeing the demand for this wholesome esculent is so large, it is not more generally cultivated in the vicinity of

the Thames, where suitable spots are plentiful.
Clapham has hitherto been a suburb almost destitute of market gardens. In a return published some years ago only 3 acres are stated to be thus occupied, although upwards of 400 acres are set down as "meadow," including, we suppose, Clapham Park, an estate of the Bowyers, and which was known as Bleak-hill Farm until Mr. Thos. Cubitt in 1824 took a lease of it, made roads, and planted shrubberies, subsequently erecting handsome private residences; but floriculture has for many years been largely carried on at Clapham by various amateurs who were men of wealth, such as Messrs. Thornton, Webb, and Hibbert. Mr. Hibbert had at the beginning of this century a large collection of Heaths, Banksias, and other Cape or Australian plants, and in his establishment the late Mr. Knight received his training. The Royal Claremont Nursery, close to the Common, is probably the most conspicuous nursery in Clapham at present; the ground attached thereto is moderate in extent. Mr. Boyce of the Clapham Road Nursery, near Stockwell, informs me that his nursery was established by Mr. R. Attlee about 1840. Nearly an acre here is covered with buildings. This has been a nursery devoted to softwooded flowering plants, and much resorted to for Camellias, Geraniums, &c. Indian Azaleas and double Primulas have also been a speciality with the proprietor. A smaller establishment in the same road, which is now called the Rose Nursery, once belonged to Mr. Fairbairn, who was famous for his Cape Heaths some thirty or forty years ago. In Manor Street, Clap-ham, is situate another small nursery, now in the occupancy of Mr. Bedford.—C.

THE LIME GROVES OF MONTSERRAT.—The little island of Montserrat, one of the most charming and salubrious of the British West-Indian colonies, with an area of but forty-seven square miles, or considerably less than that of London, contains the most extensive and best cultivated plantations of the Lime fruit tree in the world. These "orchards" are the development of a small plantation established but a quarter of a century ago by a Mr. Burke, when the virtues of the juice of the Lime fruit were not so universally recognised as they are now, when for the captain of a ship to neglect to distribute among his crew their daily dose of lime juice is to run the risk of heavy pecuniary penalties, to say nothing of serious out-breaks of scurvy. The cultivation of the plant, which involves a large outlay of capital with no immediate return, was not at first attended with any commercial success, but the Montserrat Company now owns six hundred acres of land, bearing 120,000 trees, from which a crop is gathered nearly all the year round, the heaviest harvest extending for three months, from September to January. The appearance of the trees—with their dark green leaves growing thick and bushy, and relieved at one and the same time by the bright fruit in different stages of ripeness, from green to a rich ruddy yellow, and by the fragrant white flowers, resembling Orange blossoms—is one of extreme beauty, and a Lime tree orchard is perhaps unequalled by any other similar plantation. The very leaves of the tree emit a delicious perfume, and are largely used in the West Indies for the purpose of scenting water for toilet and other purposes. The trees do not bear fruit till they are seven years old, and during that period they require careful attention and pruning; they are otherwise easy of cultivation, flourishing best in light soils near the sea. The production of fruit is very large; and the process of extracting the juice is easy, the fruit being simply sliced and pressed, and the juice at once placed in casks ready for exportation. A secondary product is citric acid, which is procured from the inferior fruit, and by a subsequent manipulation of the refuse from the first process of squeezing. There is room for a large extension of the industry, and many of our colonies besides the little Leeward Islands might turn

their attention with advantage to the cultivation of the Citrus Limetta.—(The Colonies and India.)

NOTES ON VILLA AND SUBURBAN GARDENING.

NOTES ON VILLA AND SUBURBAN GARDENING.

Now that all the summer bedding-out arrangements are completed attention must at once be turned to propagating and preparing a stock of plants for filling the flower beds in the autumn, so that the beds may present a gay appearance in the spring. In ordinary winters they thrive, and when well in flower they lend a charm to the flower garden department some months before it is safe to plant out the summer occupants. Many plants, such as Polyanthuses, Daisies, Aubrietias, Arabises, and others should be divided and transplanted in the reserve garden at regular distances apart, where they will have time to become established and can be lifted to take the places of the summer bedding plants after the latter have ceased to be ornamental. The double yellow and choice varieties of Wallflowers are increased by taking off as many of the young shoots at the joints (called slips) as required, and inserting them in very sandy soil under handlights, allowing the lights to remain on until the young plants will bear exposure to the air without flagging. The common single dark variety can be readily increased by seeds, and after the seedlings are large enough to handle transplant them in an open position and on tolerably poor soil in order to make them dwarf and stocky. Thus treated they will withstand the winter and cover the ground better. Myosotis and Silenes are best raised annually from seed, which should be sown early in July, for there is nothing lost by sowing early, as the plants bloom correspondingly early next spring.

The dull, showery, and almost sunless weather we have experienced around London for some time has been advantageous to the bedding plants, and the work for the present will be confined to regulating the growth and keeping them free from weeds. The foliage of every plant is remarkably fresh and clean. Rhododendrons have bloomed profusely, and the trusses were immensely large; the plants are now making extraordinarily rapid growths. Carefully look over every plant

hardy Azaleas and Kalmias, both of which are not nearly so extensively grown in villa gardens as they deserve. The varieties
of the former are now very numerous, and whole beds may be devoted advantageously to their culture. Almost any kind of light
soil will suit them, and they furnish a large and useful supply of
bloom early in the year. Roses are coming into bloom very
slowly; but the foliage is remarkably fine, bright, and clean.
Caterpillars and the Rose maggot have been very numerous, and
will for some time yet require constantly hunting after to keep
them in check. It is very annoying to the cultivator to find
plump buds that a few hours ago looked so promising, eaten on
one side. Destroy all shoots on the Briars either springing from
the roots or the stems. the roots or the stems.

the roots or the stems.

Gardeners and amateurs are sorely tried just now to keep the grass well and evenly mown and the weeds in check. The moist sunless weather causes both to grow very rapidly, and it is only with attention, perseverance, and hard work they can be kept sufficiently under. It is next to useless to hoe weeds and allow them to remain on the surface. The better plan is to gather them up and cart them away; then on the first dry day lightly hoe the beds and borders again, which will destroy the small seedlings just springing up and will loosen the soil sufficiently to allow the air to renertrate it.

to penetrate it.

The work in the kitchen garden department is also pressing on The work in the kitchen garden department is also pressing on every hand. Asparagus beds have to be hand-weeded; Onions, Parsnips, Carrots, Beet, Scorzonera, Salsafy, &c., must be kept thinned to distances varying from 9 inches to a foot apart. Another sowing of Carrots may be now made of James's Intermediate; these will make in most gardens useful roots by autumn. Earth-up the remainder of the Potatoes, and draw the soil to and stick advancing crops of both Peas and Scarlet Runners. Make another sowing of Dwarf French Beans, they will be found very useful for a late supply. Regulate the growths of Veretable very useful for a late supply. Regulate the growths of Vegetable Marrows, and train and stop Tomatoes just above the bloom. Fill every vacant spot with Brussels Sprouts, Savoys, Broccoli, and other winter vegetables, so that there may be no falling-off in these in the autumn and winter months. Maintain supplies of

Lettuces, Radishes, and other small salads by sowing frequently, transplanting and tying them for blanching as required.

All plants such as Spiræas, Deutzias, Richardias, Schizostylis, Lily of the Valley, &c., that have done service in the conservatory are the better for being turned out of their pots and transplanted in rows or transplant in rows or transplant. are the better for being turned out of their pots and transplanted in rows or trenches in an open piece of ground, and must be well supplied with water throughout the summer months; they will then make fresh strong growths, and can be lifted to do duty another winter. Roses in pots that have done flowering should have the soil shaken from their roots and be repotted again in a good mixture of loam and manure. Place the plants out of doors with the pots plunged in cocoa-nut fibre or any other material; with the assistance of water during dry weather they will do well until the fall of the year, when they may be pruned for forcing

WORK FOR THE WEEK.

FRUIT HOUSES.

Vines.—The weather we have had lately—dull, with occasional gleams of sun—is the worst that can be for scorching and scald. The best preventive of both is a rather high night temperature, early ventilation by day and a little at night. It is not desirable to close early at this critical period, but do so carefully, and as the liability to scald does not extend over more than ten to fourteen days particular attention should be given to ventilation. Grapes colouring should have plenty of air, a little fire heat being almost a necessity with a view to promote a circulation of rather dry warm air, and to secure the perfecting of the crop. To late crops warm air, and to secure the perfecting of the crop. To late crops swelling their fruit give abundance of liquid manure and plenty of atmospheric moisture. A sprinkling of guano on the borders both inside and outside and washed in will be of service against red spider. If not already done complete as soon as practicable the thinning of late Grapes, and as they will have to hang through the winter they require thinning well or they will not keep, especially when cold accompanied by damp has to be contended with. Keep the Vines free from all gross lateral growths, not allowing them to make strong entangled growth, and have to remove them in great quantity. Early Vines from which the fruit has been cut must be well syringed every evening to preserve the old foliage as long as possible in a healthy condition, for when the foliage goes off early from red spider or other cause second growth not unfrequently sets in when they ought to be going to rest. Attend goes on early from red spiner or other cause second grown not unfrequently sets in when they ought to be going to rest. Attend to the requirements of young Vines, watering liberally at the roots with tepid soft or pond water, and maintain a moist atmosphere by frequent sprinklings, syringing at closing time, which do early so as to secure a good moist heat without having recourse to artificial heat. Pot Vines that have completed their growth

artinicial neat. For Vines that have completed their growth should now have less moisture, syringing being discontinued, and the supply of water at the roots moderate, air being freely admitted, and afford the principal foliage all the light practicable.

Figs.—The first crop in the early house will be all gathered, and more moisture in the atmosphere will be desirable; therefore resume the syringing of the trees twice daily, and the sprinkling of the house as advised before the colouring of the fruit commences. the house as advised before the colouring of the fruit commences. The thinning of the fruit, if plentiful, must be free, reserving those which are nearest the base of the shoots. Tie in the growths to the trellis as they advance, stopping or removing such as are not required, regulating those retained so that they may receive the beneficial effects of light and air to mature them perfectly. Do not allow the trees to suffer by want of water; those in pots or planted out in borders of limited extent will require water frequently, affording on every occasion a little guano mixed with it. Where crops are ripening constantly maintain a free circula-tion of dry warm air, which is essential to the Figs ripening perfeetly. Trees in pots required for early torcing must not be neglected for syringing overhead occasionally, attending with regularity to the watering, supplying with liquid manure on every occasion.

Peaches and Nectarines.—So soon as the fruit is all off the trees in the earliest houses attend to syringing so as to dislodge red spider, the garden engine in the case of large houses being the spider, the garden engine in the case of large houses being the most effectual. In case of the lights not being moveable so as to allow of the trees being exposed to rain, the inside border must not be suffered to become dry, but have a good watering as required so as to reach the roots, and if a little guano water is afforded it will assist in the trees forming plump flower buds. In succession houses where the fruit is making its later swelling the syringe or engine must be applied vigorously to keep red spider in check. Afford abundance of air in favourable weather, closing rather early so as to economise heat. In the case of red spider rather early so as to economise heat. In the case of red spider rather early so as to economise heat. In the case of red spider obtaining a hold apply an insecticide, as it is important that the foliage be clean right through the season or the fruit will not swell off well, and the effect upon the trees in the future is most disastrous. Keep the shoots tied down as they advance, and thin out those that are superfluous, pinching the laterals on the strong shoots back to one joint. Should mildew appear on the foliage or fruit sulphur must be sprinkled over them, discontinuing syringing for a time.

Orchard House .- The different kinds of fruit trees in this structure will by this time have had the fruit carefully thinned wherever necessary, and they will be rapidly swelling off the portion left for the crop. To encourage the swelling of the fruit as much as possible the trees should have liberal treatment, such as rich mulchings and liquid manure, but it must be regulated according to the vigour of the trees and the crop they are carrying; those vigorous and carrying only a moderate crop will need less mulching and less frequent supplies of liquid manure than those more or less moderate in vigour and carrying a heavy crop. A genial atmosphere must be maintained by brisk syringings every evening when the weather is warm, closing the house somewhat early

when the air is cold, giving less ventilation when the wind is boisterous than when warm and mild. When the weather is warm the ventilators should be open at night as well as by day. The trees will require to be frequently examined for disbudding or pinching while require to be frequently examined to disbutuing of pincing back strong growths with a view to keeping the trees in proper form, avoiding, however, very close pinching in the case of vigorous growers, as it only provokes secondary growths, and too great denudation of foliage at one time is more likely to cause an unhealthy condition of the trees than to favour their fertility. The earliest kinds of Cherries will be nearly ripe; syringing in their case should cease or the fruit will crack and be spoiled, indeed syringing should be discontinued so soon as the fruit shows colour. It is important that the trees be kept clear of insects, especially black aphides, which not only injure the tree but render the fruit unfit for use. Fumigation is the best remedy, but if there be no need to fumigate the whole house the trees may be removed, if in pots, to a separate structure. It will answer to apply an insecticide in the evening, and the following morning giving a washing with the garden engine. Birds must be excluded by placing some netting over the ventilators. Fig trees in pots now approaching the critical stage should, to prevent the pots now approaching the critical stage should, to prevent the fruit dropping, be liberally supplied with water, and every care taken to prevent a check. The points of the strong-growing shoots should be pinched out; weak and unnecessary ones should be rubbed off altogether, allowing no more foliage than can be fully exposed to light and air. In most orchard houses a Vine is grown, a single rod being trained over the pathway to a wire with one on each side for training the shoots to; the shoots produced by the rod should be stopped one joint beyond the bunch (if no fruit appear at the sixth leaf), securing them to the side wires, and the laterals being pinched back to one leaf but little shade will be thrown on the trees, the Grapes produced having a pleasing effect as well as being useful, especially where there is no other convenience for growing them. The bed or border in which they are grown will need copious supplies of water, especially if inside,

convenience for growing them. The bed of border in which they are grown will need copious supplies of water, especially if inside, and some liquid manure occasionally.

*Cucumbers.**—A few seeds may now be sown for late summer and early autumn fruiting. They will germinate, and the seedlings be fit to plant out in about a month. Attention must be given to plants in full bearing by way of thinning out the exhausted growths and foliages laying in roung bearing wood stopping one joint. and foliage, laying in young bearing wood, stopping one joint beyond the fruit, and earthing up the roots periodically. Copious supplies of liquid manure will be required about twice a week or supplies of liquid manure will be required about twice a week or as may be necessary, but avoid applying it too strong, syringing at closing time, and maintaining a good moisture all day by sprinkling every available surface as necessary, but more frequently in hot weather than when dull. Do not overcrop young plants, and do not allow the fruits to hang too long, as upon attention to this depends in a measure a good and continuous

supply.

FLOWER GARDEN.

The success of carpet bedding is more due to its being well kept than to elaborate design. The lines, divisions, and groundwork should be kept well defined. To insure the covering of the ground quickly peg such plants as Alterantheras, press down Sedums, and pick off flowers and pinch Antennarias, Cerastiums, and Golden Feather Pyrethrum. Peg down Gnaphaliums, Iresines, and Coleuses to insure their spreading quickly, also Verbenas, Petunias, Lantanas, Nasturtiums, and Lobelias, encouraging them in every way to cover the ground as quickly as possible. Should the weather set in dry afford abundant supplies of water or the the weather set in dry afford abundant supplies of water, or they will soon curl and fade in colour. Subtropical plants can scarcely be over-watered provided the weather be bright, mulching them be over-watered provided the weather be bright, mulching them with well decomposed manure, and stake and tie as they advance in growth; Hollyhocks, Dahlias, and other vigorously growing plants should be treated in a similar manner. Pinks and Carnations should be neatly staked before they get too forward. Push on the propagation of these by piping and layers, making choice of a half-spent hothed on which to place the handlights to contain the pipings, inserting them in sharp sandy loam, and keeping them well shaded from the sun, sprinkling gently occasionally so say to keep the atmosphere moist. Cuttings of Roses root freely as to keep the atmosphere moist. Cuttings of Roses root freely at this season; make them from well ripened wood, and treat them as advised for striking Carnations. Briar and other stocks will shortly be sufficiently forward for budding. In performing this operation make choice of buds on wood that has just borne flowers, as these are not only mature but preferable to the large inmature buds obtained from the quick-grown barren shoots. extracting the wood from the bud care should be taken that the extracting the wood from the bud care should be taken that the bark is not bent back too sharp or bruised in any way, as when that is the case the bud is certain to turn black and fail. Herbaceous Lobelias throwing up their flower stems should have supports and be well supplied with water. The Monkey Flower or Mimulus make grand beds with their singularly shaped bright-coloured flowers and rich markings, and with a mulching of partially decayed leaves in winter are as hardy as Mint, blooming in early summer and continuing for a long time if well supplied with water. The herbaceous borders will now be very interesting. with water. The herbaceous borders will now be very interesting, and should have attention in staking and tying such as require it and in keeping down weeds.

TRADE CATALOGUES RECEIVED.

W. Dobbie, Faversham.—A List of Geraniums and Fuchsias.
W. Lovel, Weaverthorpe, York.—A Select List of Strawberry

Wm. Cuthush & Sons, Highgate.—Autumn Catalogue of Bulbous Plants.

TO CORRESPONDENTS.

, All correspondence should be directed either to "The Editors" or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg eften remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at euce. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BOOKS (W. H. B.).— Messus. Chambers publish an "Introduction to Botany." You can see its full description in their catalogue of books. (J. G.).—We do not know of any chesp volume published such as you appear to require. Messus. Cassell & Co. are issuing a work in numbers which might be useful to you.

PRAS UNHRALTEY (M. M.).—Excessive wet is the cause of your Peas being so unhealthy, and they are also much injured by snalls. Probably the Peas are, or were, too thick in the rows. Finer weather is the only remedy now. The Fern, which arrived much crushed, appears to be Oncolea sensibilis.

YOUNG GARDENERS FOR INDIA (B. Young).—We think they are eligible for the duties you name at eighteen years of age.

WATER-TIGHT STOP-COCKS (I. M. K., M. D.).—Foster and Pearson's patent throttle valve will suft you: it is a very simple and effective one.

BESTLES ATTACKING ROSE BUDS (Dunketd).—The name of the beetle which is destroying your Rose buds is Anisobia horticols, the magnots of which live under the ground and feed on the reots. The only certain method of eradication is by hand-picking.

PRACH LHAVES BLISTERED (Resealls).—The blister is caused by cold and occasionally destroys the trees. It is incurable, and you can only remove all the worst leaves and trust that the growth now made under the influence of warmer weather will be clean and healthy. See Mr. Luckhurst's notes on page 483 of our last week's issue.

BRECOVING FRUIT TREES (W.).—No fruit trees or bushes, though planted by the tenant, can be removed legally unless the landlord's permission has been obtained previously. So many circumstances have to be considered that unless you obtain the landlord's permission you had better consult your attorney.

SUMMER-PRUNING DWARF APPLE AND PHAR TREES (Armiger).—The sheets upon the main branches should be stopped at the fourth leaf and the terminals at the sixth, repeating if necessary. See last week's "Work." Gooseberry and Currant bushes may be pinched when the fruit is ripening, but if done previously so much the better. Salt for walks to destroy weeds may be had of any agricultural manure dealer.

may be had of any agricultural manure dealer.

REPOTTING CHRYAKTERMUNS (J. P. Y.).—The plants being forward and strong we should shift them from the 8-inch to 10-inch pots, merely removing the drainage and the surface soil and potting rather firmly. The season is too far advanced for reducing the balls, though that may be done to the extent of about an inch all sound, returning the plants to 9-inch pots, and standing them under a north wall or in the shade until they have recovered from the effects of potting, when they should be placed in an open situation. Do not stop them, but the the shocts well out, thinning out the weaker once in case the plants have been kept over from last year. Do not allow them to want for water, and supply them with liquid manure at every alternate watering.

WORMCOSTS ON LAWN (I. R. C.).—Place a peck of quicklime in thirty gallons of water, stir well up, and allow it to stand two or three days; then water the lawn thoroughly with the clear lime water. The worms will come to the surface, when they may be swept up and cleared away.

VINE LEAVES SCALDED (W.A.B.).—The spots on the leaves are scorched, which may be obviated by admitting air more freely, especially during the early part of the day, with the top ventilators open about an inch at night. The Vine with the stem showing signs of cracking is only a result of the increasing thickness of the rod or cane, and will not in any way affect next year's fruiting.

PINCHING VINE LATERALS (F. I.).—The laterals should be stopped at the first leaf, and the succeeding growths likewise, the leading shoots being stopped at the top of the poles.

BORING FRUIT TREES (does).—The boring to be effectual must be large—not less than an inch in diameter for trees of a foot diameter, but is not a process to be recommended, as it only tends to premature fertility and death.

ROSES FOR VINERY (G. Thomas).—If the Vines cover the roof so as to cause much shade beneath, Roses would not thrive. The most likely to do are Tess.—vis., Souvenit d'Ellis, Sombreuil, Duchess of Edinburgh, Catherine Mermet, Marie Sisley, and Niphetos.

BUILDING A GREENHOUSE (Y.).—A lean-to for so narrow a house would be the most suitable, which you may have constructed as you desire by a local tradesman or horticultural builder. There is no objection to the ready-made houses, the price of which may be obtained on application to those advertising, stating what is required.

VIRES UNHEALTHY (F. H. F.).—Without a line to guide us as to the age, history, or conditions of culture of the Vines, it is impossible to give a satisfactory reply to your question. The Vines appear to be growing or trying to grow in an ungenial soil, and the house has probably been kept much too close and moist. If all the bunches are like the one you have sent the crop is rained.

CUTTING THE TOPS OFF TREES (S. M.).—Without knowing to what trees you refer, it is impossible to answer your question.

TREES AND SHRUBS IN FIELD (Flore).—Unless they are protected the pony will doubtless injure them considerably, and may also injure itself if it has access to Yews. The sprays sent appear to be of Azalea amona.

FRAGRANT ROSES (H. C.).—All the Roses you name possess fragrance but not so intensely as some other varieties. Your second question shall have our consideration.

MEALY BUG ON GRAPES (W. L.).—We pity you, but fear we are unable to render you any aid. Can any of our correspondents suggest a mode of clearing the bunches of Grapes from mealy bug? The plant is a Tradescantia, but we cannot determine the species from the specimen sent.

ANTS EATING ROSE BUBS (L.H.).—If you refer to page 447 in our issue of June 19th, you will find that we recorded an instance of ants destroying buds of Marcohal Niel Rose that came under our notice during the present year. We are much obliged for the enclosures, which shall have our consideration; your request shall be attended to.

MELONS NOT SETTING (J. T. S.).—The plants are over-luxuriant. If you withhold water as you propose, and give the plants a partial but not excessive check, watering them when the foliage shows signs of flagging, and maintain a drier atmosphere, fertilising the blossoms, the fruit we think will set. The late dull and wet weather has been unfavourable to the setting of Molons.

RHODODENDRON REGEWORTHII (Idem).—This plant is a native of the Himalayas, and requires an ordinary greenhouse temperature with a soil composed of lampy peat and loam in equal parts, a little sand being added.

MHLONS CRACKING (A. B.C.).—You appear to have done all you can to arrest the cracking, and probably the evil will not be so serious as you imagine. You grew the plants too luxuriantly in their early stages. We can only advise that you continue the treatment you have adopted. As soon as the fruit changes for ripening cut it and place it in a warm house, where it will complete the ripening process.

where it will complete the ripening process.

Grapting Orange Trees (A Foung Gardener).—The present time is a suitable one for the purpose; but you must keep the plants in a moderately close house after the operation, shading them, and neither allowing the stock nor the material surrounding the scion to become dry. Ordinary whip or tongue grafting is well adapted to those plants. Be careful to insure a close union of the scion and stock, then the with fine best and surround the junction with clay or moss. Respecting the other question Loudon's "Instructions for Young Gardeners" would convey the information you desire, or an elementary work on geometry would contain all particulars concerning drawing to scale.

TROP. EDLUM SPECIOSUM (Merica).—Plant it in a moist and partially shaded position. It dies down completely, and requires no covering of senses, being perfectly hardy.

BUDS OF MARKCHAL NIEL DROPPING (G. F. Macclinson).—The cause of the buds dropping is probably a defective supply of nutriment in the soil. Give a top-dressing of well-decomposed manure, or water the plant frequently with liquid manure, and no doubt you will soon perceive a difference in the vigour of the wood and buds.

WEEDS AMONG VETCHES (R.C.).—The plant with which you are troubled is the common Corn Cockle, Agrostemma Githago (Lychnis Githago), the pest of corn fields. The seeds are small, black, and granular, and are reputed to render flour unwholesome when ground with it.

reputed to rander flour unwholesome when ground with it.

NAMES OF PLANTS '(G. H.).—Hippeastrum (Amaryllis) reticulatum. (E. C. B.).—Thalictrum aquilogifolium. (B. Cosen).—I, Iris hiflorus; 2, Hemerocallis flava; 3, Melittis melissophyllum. (E. T. S.).—I, Iris Pseudacorus; 2, Probably an Iris, but too withered to determine; 3, Viburnum Opulus; 4, Lilium pyrensicum; 5, Perrettya angustifolia; 6, Kalmis angustifolia rubra; 7, We think it is Silene coynoides, but the flowers were very withered. (H. R. C.).—I, Saxifraga ceratophylla; 3, Resembles S. hypnoddes, but it had no flowers; 5, Campanula turbinata; 6, Iris graminea; 7, Ornithogalum nutans. The others were too withered to be recognisable. (James Boyd).—1, Cerasus Padus; 2, Polygonum minus; 3, Euonymus japomicus latifolius aureus; 4, Thymus villosus; 6, Saxifraga hirsuta; 6, Berberis Darwinii. (T. F. Simpson).—Scilla amcens. (M. M.).—I, Polystichum mucronatum; 3, P. angulare var.; 3, Cystopteris fragilis; 4, Lastrea dilatata; 5, Doodia caudata. (H. G. M.).—Hieracium aurantiacum. (Mr. Polygonium inequale; 3, Asplenium bulbiferum; 4, Polypodium calcareum.

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

SUBURBAN VILLA FARMING.

(Continued from page 486, vol. lxi.)

WE must now consider the numbers and kind of live stock to be kept on the suburban farm, and this will vary with the taste and fancy of the owner to a great extent. The situation and climate will necessarily have some influence in the choice of stock, particularly in the selection of cows. Horses, also, will generally be kept, probably three in number—a riding horse, also one for the brougham or wagonette, and one stout active animal for the farm and odd work. Pigs and poultry will also generally form part of the live stock. In the remarks which follow we must be understood as alluding to the extent of the villa, farm, &c., as twelve acres, in order that occupations of a greater or less extent may be managed accordingly with variations, and all matters relating thereto made suitable.

In referring first to the stock to be fed on the pasture we will consider whether the cows shall be kept to the tether and removed several times daily, or whether they shall be allowed to range at large on the grass. We should say that the animals look much more ornamental when they feed on the grass promiscuously than when tethered with only a limited range. When we require the animals to roam at large almost any cows of the smaller breeds will answer, but none will do so well tethered as the Jersey or Guernsey, because upon their native islands they are nearly always thus confined. Bither of the following breeds will do well, and are also adapted for ranging the pastures. We will take the Jersey or Channel Islands cattle as a whole, and similar to these are the Brittany, then the Ayrshires and the Kerry, each of these being suitable for certain soils, climates, and ever-varying circumstances by which they will be surrounded.

We will therefore consider the advantages of the Jersey cows first, and there never has been a time in their history when they were greater favourites than at present, particularly in the suburban districts in the southern and midland counties, where they are kept and treated as pet animals, where only a few acres of grass land are held. As regards the colour of the Jerseys the fashion has altered greatly within the past twenty years, for whilst formerly they were most approved when they were spotted or patched with red, lemon, or black, with white ground more or less, nothing at present, however, is fashionable but whole or solid colours, either silver-grey, light red, or fawn colour. This question of colour is purely a matter of fancy or taste with those who value the animals as ornamental in their pastures; but when we refer to their value for profit, or as affording abundance of the richest milk, colour will not help us. The chief point we have to look at is the parentage or pedigree of the stock. There is, however, a very great difference between the Jersey cow of the present and when we first knew them. Great and successful endeavours have been made to improve their form and quality, so much so that a scale of points is aimed at by the breeders now which requires a cow to possess thirty points before it can be considered a perfect specimen of the breed. Formerly nothing but the milking capacity was looked to, and any ugly ill-formed animal with flat sides, high hipe, and hollow back was appreciated as long as it yielded a large quantity of the richest and highest-coloured milk. In the breed approved at present we find the cows which are the greatest favourites are those with the fawn-like head, the soft and quiet eye, the elegant crumpled horn and small ears, and the well-formed capacious udder, yielding milk so rich with a deep tinge of yellow that it seems like that which is often sold as cream in cities. The pure bred Jersey cow is a singularly docile animal; the male, on the contrary, is apt to become fierce after two years of age. The stock bred in the island vary in hardihood, for those reared on the high and northern parts possess a hardiness of constitution that enables them to withstand even a Scotch winter, whereas those bred in the low rich pastures of the island are of larger size but more delicate in constitution. The Jersey is, no doubt, the best family cow where they have only a limited grazing area, and they not only furnish under favourable circumstances from fifteen to twenty-five quarts of milk in twenty-four hours, but from 10 to 14 Res. of butter weekly in the spring and summer months. To have butter in perfection when the cream is so rich it should be made every morning, at any rate it should be made every second or third day; besides butter, clotted cream made as in Devonshire, and also Bath and cream choese, are luxuries which may be obtained in perfection from these cows when fed for the

The Alderney breed of cattle are so nearly allied to the Jersey that they are often sold by the dealers as Jerseys. There is, however, a distinctive difference in the Guernsey breed, for they are larger animals, carry more flesh, do not give so much milk as the Jerseys, but their milk is so extremely rich in cream, and so high soloured, that the butter in hot weather is very difficult to make up into printed half pounds. We once had a dairy of all Guernsey cows, but we were obliged to sell some of them and take up some

Jerseys, as the cream in hot weather was more like oil, and the butter when made was more the colour of beeswax than the light yellow tinge peculiar to Jersey butter.

In continuation of our subject we must notice the Ayrahire cow as the characteristic dairy breed of Scotland. She is a model animal, furnishing the ideal form of a miniature butter-making cow. She stands on short legs and is long and well built in proportion to her height. As compared with the Jersey she is coarse in the head, and long and strong in the horn, and usually of a mixed colour of white with red, light brown, or black spots. They are of a hardy habit and large milkers, yielding a good proportion of rich cream.

We can only find space to notice one more breed adapted for villa farming—viz., the Kerry cow, an Irish native animal, yet appreciated in various parts of England and Wales, being very hardy and well suited to the cold pastures of the Wealden district of England. One of their characteristics is a self colour of either red or black, and in proportion to their size they yield a full quantity of rich milk. They do well and maintain condition on the poorest pastures. Their outline is regular, with rather coarse head and short straight horn, when compared with the handsome head and well-turned horn of the Jersey cow.

We have dwelt rather at large upon the merits of the cows we consider most worthy of attention in connection with our subject, as being essential to the customary mode of villa farming. In their management it may be advisable in those cases where only two or three acres of pasture are available to have the animals tethered, but practically it is wrong where four, or five, or more are kept, as the labour of shifting the tether four or five times a day is inconvenient. Unless we take Jersey cows from the island, or from where they have been broken-in to the tether, they would for some time prove restless enough to interfere with the supply of milk. We, therefore, recommend the roaming-at-large mode of feeding as being the best economy, especially if the grass land is well fenced with moveable and stout iron cattle hurdles, or a fixed strong flat or round hollow-barred fence of iron. We object entirely to wire fencing, as being not only insecure but dangerous to the cows, and constantly requires repairs. We have in year past ereoted a great deal of wire fencing, we now prefer only the firm barred fencing; although more costly at first it is cheapest in the end, and also safe fencing for either cattle or horses, the

latter more particularly.

We wish now to consider the mode of feeding, &c., of the cows both in winter and summer, and before concluding our subject to consider the mode of providing for cows, horses, and pigs at the farmery, both as to buildings for their accommodation and other matters incidental to the proper and economical conducting of a villa farm. We will first allude to the fact that we can very well maintain four cows of either of the small breeds named upon the twelve acres of land, also three horses, and a number of pigs and some of the varying according to circumstances and the wish and intention of the owner, purchasing only some hay, straw, and some of the various kinds of feeding stuffs for cattle and corn for the horses, because upon the mode of conducting the land we have set forth no cereal crops will be grown. It will be necessary in order that the supply of butter, milk, &c., shall be available all the year through, that the cows must be brought in to calve at spring, summer, autumn, and winter. It is only under peculiar circumstances that we can recommend the keeping of a bull at the farmery, particularly of the Channel Islands' stock, as they are very troublesome and sometimes dangerous. Still, where there is no bull at hand anywhere in the neighbourhood, it is somewhat imperative, unless the cows are sold out at the end of the milking season and a purchase made of in-calf cows, to maintain numbers intact. All the best milking cows should give milk up to within about a fortnight of calving again, for it is not only a great loss where cows are allowed to go dry for two months or mere, but when the animals are well fed with the best of materials they are apt to accumulate fat internally, which is very often attended with serious consequences, such as parturient fever, &c.

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour.—On account of this being in arrears, owing to the wet weather in the latter part of May and early part of June, the pressure of horse labour comes now inopportunely during the period of haymaking, stacking, &c. This not only delays the preparing and drilling the land for root crops, but seriously interferes with the important work of securing the hay crop. There is, however, a rule which we have often acted upon in case the seeding for root crops came at the same time as securing the hay; that is to work the horses in ploughing, harrowing, and drilling the seeds of Swedes or turnips in the mornings up to midday, and then in the afternoons to put all horses and men to carting and stacking the hay. There is a double advantage in this arrangement, because the morning part of the day is best for the root cultivation, and the after part of the day is most suitable for stacking the hay crop. At least, this is the case in hot, dry, settled weather, for when we have been cultivating and drilling the seed of root crops in a dry time we have kept drilling done

close up to the ploughing, and we have even noticed instances where one ridge has been left undrilled when the men and horses stopped for luncheon and baiting in the middle of the day the stopped for luncheon and baiting in the middle of the day the seed would not vegetate, and proved the only failure of the root crop in the field; therefore the work of drilling should always be effected close up to all the land ploughed. Again, as regards the question of hay carting, it is very rare indeed that we find the hay in such perfect condition for stacking in the morning as it is in the afternoon, and it should be still further arranged if possible that the pooking or rowing-in of the hay should only be done just before the carting, in order that it may go into the rick hot and dry. It seldom does so well in rick after being in pook one day or more before carting, because even in the best and finest one day or more before carting, because even in the best and finest of weather the dews at night affect the condition of the hay in a greater or less degree. In the case of showery or uncertain time as regards the weather of course the above statement will not hold good, because the seeds of turnips would be sure to vegetate at any time of sowing; and as regards the hay in such weather it would be wise to stack the hay when fit, and not risk it by doing half a day's work when a whole one could be done with

advantage.

Hand Labour.—This, during the having season, is valuable whether it rains or shines, because there is always work to be whether it rains or shines, because there is always work to be done. In showery weather there is the mixing and preparing with ashes the artificial manures for drilling with the seed for root crops; then, again, straw may be drawn and heaped up ready for thatching the hayricks, the fetching of bavins or faggots for making rick stands. The trimming of quickset hedges, too, about this period should be done for the first time whilst the young shoots are soft, for no hedge can be so well or properly trimmed if left until the autumn time of year, when the wood has become hard. The question of overtime with the workmen and farm labourers is very important, and an agreement with them by the home farm manager should be quite understood, in order that there may be no excuse for delay in the work or attempt at a strike for better terms. In the present temper of the working men in some districts it is very desirable that not only liberal wages should be given, but a well-defined agreement as to working overtime either for food and drink or extra wages. The handhoeing of mangold, Swedes, early turnips, &c., will be going on at every opportunity, and in order to effect this the work should be done by the acre, so that the men may lose no opportunity of working long days or parts of days. This will not only enable them to keep the work of hoeing done whilst the root crops are the right size, but also encourage the men by enabling them to them to keep the work or hoeing done whist the root crops are the right size, but also encourage the men by enabling them to earn more money, with the further advantage of employing their wives and children in singling the plants behind the hoers. The home farm dairy cattle will now require extra attention from the fact that cows in milk suffer greatly not only from any excessive heat of the weather but also from the annoyance of flies, and unless the meadows and pastures are peculiarly situated—such as those on the salt marshes near the sea or on high and exposed those on the sait marshes near the sea or on high and exposed situations—they are sure to suffer more or less from these causes. The cattle should, when the sun is unusually powerful, be taken to the homestead into their shaded stalls or sheds from ten o'clock till four in the afternoon, and receive in their manger or racks a bait of green fodder, such as vetches or clover, lucerne, &c. Where animals are allowed only the pasture produce, and are subject to the teasing of files, it is sure to result in a diminished quantity of milk which further leads to the shortening of the milking registed. milk, which further leads to the shortening of the milking period a matter of no slight importance, and these two points together when properly considered will show that the expense or extra labour incurred will be amply repaid.

THE INTERNATIONAL AGRICULTURAL SHOW AT KILBURN.

It may not be without interest to our readers to learn that Dr. Hogg's Kerry cattle, figured on pages 488-9 last week, have taken a creditable position at this great Exhibition. The bull, La Mancha, obtained the second prize, and the cow, Fair Ellen, was commended by the Judges in a class numbering twenty-nine

The Exhibition is on such a scale of magnitude and completeness, is so varied and instructive in the several sections, that all who have an opportunity of visiting it should take advantage of the first fine day for doing so, for, as the Prince of Wales ob-served at the Show on Tuesday, there does not appear to be any certainty of the weather continuing fine for more than twentyfour hours together during the present extraordinary season. In every section but one the entries are more numerous than they have been at any previous show of the Royal Agricultural Society; and, as observed by a correspondent, a much-neglected branch of the home farm is admirably represented—namely, English and foreign goats, the former excelling the latter both in quality and numbers

A striking feature of the Exhibition is the imposing display of seeds, roots, &c., arranged by such great seed firms as Messrs. Sutton & Sons, James Carter & Co., Edward Webb & Sons, and

others, which represent in a remarkable manner the magnitude of the industry in this important branch of agriculture.

We can only at present refer to the following awards. In the competition for market gardens exceeding ten and not exceeding twenty acres in extent, and situated at a distance of not more than twenty miles from the Mansion House, Mr. W. Gay of Axe Street, Barking, is awarded the first prize of £50, and Mr. W. J. Gay of Corbetstye, near Romford, the second of £20. They were the only competition. the only competitors. In the competition for market gardens of over fifty acres, and also within twenty miles of the City, there were again but two entries, the first prize going to Mr. Lancaster of Canning town, Essex, and the second to Mr. Patch of Faircross, Barking. There was a fifth class for market garden farms—on which market garden crops alternate with farm crops—above a hundred acres in extent, and here again there were only two entries for three prizes. The trustees of the late Mr. Circuits, at Rainham, and Mr. Glenny of Cecil House, Barking, were awarded the first two prizes. The Show ground is very imperfectly drained.

CANARY TREATMENT.-No. 6.

THE offspring of London Fancy birds when chipped very much resemble those from the Lizard breed, but when they become clothed with their nestling feathers are more the colour of young brown Linnets, excepting that the tail and wing feathers are much darker. These latter feathers are retained during the period of moulting off the whole of the dark body feathers for a garb very different indeed in appearance, that of a rich orange colour. But like other Canaries there are two classes—Jonque and Mealy—and unless they are well moulted in box cages do not possess great like other Canaries there are two classes—Jonque and Mealy—and unless they are well moulted in box cages do not possess great depth of colour or silkiness of feathers. No other Canary undergoes such extraordinary changes in the plumage as do the London Fancy birds, for not only do they turn from a dusky plumage to a rich orange colour, but after the first year's moult they likewise lose the black feathers of wing and tail, which become somewhat grizzled in appearance. At this stage they are considered not in form for exhibiting, or, as a fancier would say, "out of feather." Many of the young from this breed possess light or foul feathers in wings or tails, but even if the stalk of the feather be dark or partly so it is counted as a dark one. It is only such feathers which are clear in stalk and webbing that are looked upon as being foul. There is a vast amount of artificial treatment exercised in bringing out the best birds. To judge of the respective merits of really first-class specimens at a show the birds should be handled, this being quite necessary in discriminating betwixt birds which so much resemble each other.

Lizard Canaries, although of a dark golden or silvery plumage

Lizard Canaries, although of a dark golden or silvery plumage when matured, differ much from some other young birds when chipped. Their skins have a flesh-coloured appearance when first hatched, but in a few days a perceptible change takes place, dark pin feathers soon budding forth excepting in the caps or crowns of the birds, which in perfect specimens should be regularly and entirely light over the entire crowns, extending to the eyelids (which should be dark) and to the back of the head, but not on to the nape of the neck. The head of a Lizard bird is a most important point, for it should not only be large but the crown should be broad, so as to more fully develope the cap. The face of the bird—that particular portion of it between each eye and the beak—should be clothed with dark feathers; if otherwise, or should be what is termed "bald-faced," it much deteriorates the value of

be what is termed "bald-faced," it much deteriorates the value of a good specimen.

Lizards, like many other birds, breed some of their stock with blemishes, understood in Canary circles as "pile feathers" or "broken-capped." It is, I know, by many breeders considered an achievement to breed a Lizard or two sufficiently good to come under the denomination of a perfect bird, first-class all-round specimens being somewhat scarce. However good the parent birds may be, still some of the offspring are foul-feathered. In days gone by many breeders of Lizards used to destroy the foul-feathered young and only preserve those approaching perfection. feathered young and only preserve those approaching perfection. I once heard a fancier assert that he could always breed perfect birds, but the fact afterwards came to my knowledge that the imperfect marked birds were killed off. I have bred Lizards a good few years, and from the very best strains I could obtain now and then foul-feathered birds would crop up. I recollect when it was first mooted that there should be classes established for broken-capped Lizards the matter met with much abhorrence, broken-capped Lizards the matter met with much abhorrence, but the objectors did not prevent the introduction of the classes into the best schedules issued from various parts of England. The matter has effected one beneficial thing to breeders, that of opening up a market for the sale of broken-capped birds, which will tend to partly recoup breeders for their trouble, besides affording an opportunity for such birds to be exhibited in classes for prizes; and not only that, but the provision afforded at shows for such broken-capped birds has done more in breaking the neck of a system of cheating practised in trimming-up indifferent-capped Lizards so as to make them pass as perfect-capped birds.

After Lizard birds have been well reared it is better either to keep them in separate partitions or cages, or moulting them in a

keep them in separate partitions or cages, or moulting them in a spacious well-ventilated attic or suitable room where there is a

snug corner or so in a state of semi-darkness for the birds to retire to. Never fix perches so that they cross each other. If you keep your birds together in cages or in a very light room so that they can notice any little blemish in each other's plumage—such, for instance, as the budding forth of new feathers, you will thus encourage a system of plucking, which mischief when once begun becomes a habit. In this way many a promising young bird has been spoiled in appearance of plumage. No greater eyesore can present itself than to see a well-defined spangled beak of a choice bird marred through a feather or two in the wings being tipped with white, the result of plucked and fresh-grown feathers. The least way to keen the plumage in close order is to let the birds. best way to keep the plumage in close order is to let the birds have plenty of cold water to splash in.—George J. Barnesby.

VARIETIES.

WE are glad to see an excellent regulation in the Royal Agricultural Show at Kilburn. Exhibitors are prohibited from placarding their goods with certificates of prizes gained all over the world, which often proves so misleading to purchasers. The only prize cards allowed to be posted are those awarded by the Royal Society itself. This good example might well be followed by the managers of many other shows, not omitting poultry shows. We have often seen pens covered with the placards of rival vendors of poultry foods, and have known them placed over snows. We have the seen pents to vertex which the placed over irial vendors of poultry foods, and have known them placed over birds which had never tasted the articles in question, with the impertinent assertion that they had been "reared and fed" upon

— WE hear that a most interesting innovation is to be tried in the awarding of prizes at the second Hemel-Hempstead Poultry Show to be held the first week in October. The various_sub-Show to be held the first week in October. The various subvarieties of each breed are all to be shown in one class—e.g., Dark, Silver-Grey, White, and Cuckoo Dorkings, arranged together according to their colours, will make up the Dorking class; Buff, Partridge, Black and White, the Cochin class, and so on. The Judges will first place in order of merit three pens from each subvariety, which will have honorary prizes or cards of honourable mention; they will then select from these pens with honorary distinction the three best pens in the whole class for the three money prizes. The scheme strikes us as a very good one: where several sub-varieties are mixed up in one class, and those of the same breed perhaps far apart, a judge often finds it extremely difficult to place them to his satisfaction, and a good deal must naturally depend on his personal fancy for some particular colour. Under this system the genuine fancier (as distinguished from the pot-hunter) will have an opportunity of testing the merits of his birds according to their varieties as well as according to their birds according to their varieties as well as according to their breeds, and will in many cases be pleased with a distinction, though it be only an honorary. one. We think that the fancying public is much indebted to the promoters of this Show. Last year the great tournament of incubators was originated by them, which has resulted in the superiority of the machine of one maker over all others being for the present fully established, however much fature improvements may alter their relative positions. This year fature improvements may after their relative positions. This year this new method of awarding prizes is to be tried, and we are very sanguine that it may prove the solution of certain difficulties in judging. Of course it will at first entail a good deal of trouble on those not accustomed to it, both secretaries and judges; but we know that the Secretary's office at Hemel-Hempstead is managed in most methodical style, and we are informed that the staff of Judges will be large enough to prevent their task being at all onerous.

WE have received the schedule of the Poultry Show of the Cambridgeshire and Isle of Ely Agricultural Society. It will be held at March on July 28rd and 24th. There are nineteen classes for poultry, nine for Pigeons, and six for Rabbits. Among the rules we notice two good ones—viz., "No one will be admitted whilst the Judges are making their awards except the Stewards, who are not exhibitors;" and—"The poultry must be bond fide the property of the orbition of arthree." the property of the exhibitor at the time of entry."

— WE have also received the schedules of the Winslow Floral, Horticultural, and Poultry Society, which will hold its annual show on July 24th. There are twenty-one open classes for poultry, also three local classes. Special local prizes are given for dead fowls, Ducks, and Pigeons suitable for the table, and for adish of new laid hens' eggs. The five classes for Canaries are epen. We are glad to see now in almost all schedules the clause adopted—"Several pens of poultry may be sent in one package provided they are properly labelled and divided." Much expense and trouble is thus saved to exhibitors.

MODERN BEE MANAGEMENT .-- No. 12.

THE NON-SWARMING SYSTEM.

BEFORE the main honey harvest commences every bee-keeper should decide on his course of action, according as increase of stocks, or honey results, or both are his object. The usual unfortunate occurrence of the swarming mania, and a great honey yield simultaneously, render such a decision absolutely necessary

if all is to go like clockwork, hives or supers or both all prepared for use at a moment's notice. His choice lies between three for use at a moment's notice. His choice lies between three alternatives—vis., to allow unlimited swarming either natural or artificial, to prevent it altogether, or to control it to specified limits. Those desiring increase of stocks alone may either leave the matter to Nature and get their stocks trebled by natural swarming or multiplied sixfold by artificial, but their honey results cannot be large. Those desiring the largest results in honey may adopt either of the other alternatives—absolute prevention, or strict limitation of swarming. It is undecided which of these two methods will yield the greater results in honey—non-swarming hives have in this quarter yielded from 100 to 170 lbs. of super honey in good seasons but whole anjaries on the limited awarming honey in good seasons, but whole apiaries on the limited swarming principle have averaged 70 to 80 lbs. on the number of stocks at the commencement of the season. The former results look dazzling beside the latter, but when it is remembered that these results were only obtained from particular stocks managed with considerable difficulty, while alongside of them were others in which the non-swarming system completely failed, it will be easily understood why in both cases the average yield per stock should be, as they in fact have been, pretty nearly equal. After practising both systems for several years my conviction is decidedly in favour of allowing a certain limited amount of increase, more especially as, being more natural, it is attended with less difficulty. However, most of our apiarian societies offer tempting prizes for the largest harvests of honey obtained from single stocks, and this is useful as exhibiting the grand capabilities of a stock of bees under useful as exhibiting the grand capabilities of a stock of bees under skilled management, but in most cases it is thoroughly misleading. None but the bee-master knows the amount of trouble he has had in obtaining such results, not, it may be, with the particular stock that headed the list, but with the six or eight others that fell behind in the race, and perhaps broke down so far as the system was concerned, became unruly, sullen, determined to be bound by no such unnatural rules as their owner would impose upon them.

For the benefit, however, of those who may desire to try the non-swarming system I shall briefly describe the method I have followed for the last three years. In early spring I selected certain stocks for the purpose, and fed them gently but continuously on candy or liquid food. As soon as brood was found on three or four frames, if the weather were warm I spread these so as to make room for an empty comb in their midst; every five or six days this process was repeated. The combs for this purpose or sit days this process was repeated. The comes for this purpose were simply the outside combs of the same hive, provided they contained little or no drone cells, the sealed honey they contained being uncapped with the knife before inserting them. As the stocks became stronger sheets of foundation were given instead, and any outside combs with many drone cells were removed. The selected number of six or eight was reduced several weeks before the time for supering by neglecting all those the queens of which gave evidence of not been able to stand this forcing system, and those only were further dealt with in which queens could keep pace with the accommodation so provided. About this time I usually gave up the feeding, and simply stimulated by uncapping portions of the sealed comb every day or two. As soon as the hive was crowded with bees I gave it a thorough overhaul just before placing on the supers. I uncapped all the remaining honey and placed all combs containing little or no brood right in the centre. Next to these were arranged those with sealed brood, and on the outsides those with eggs or newly-hatched larvæ. The object of this operation was to insure that the queen should have every inducement to continue laying, and that no honey could possibly be stored in the outer combs for almost three weeks while these be stored in the outer combs for almost three weeks while these eggs were being hatched out. The supers were immediately placed in position, and under the excitement and warmth caused by so much honey being uncapped below the bees usually took possession at once, and being gorged with honey soon set to work building comb or extending the guides of foundation. At first considerable attention was needed to keep the supers close and warm, but after a few days, as the population increased, all un-necessary wraps were removed and the hive entrance gradually enlarged, so that there might be free ventilation throughout, and the hive was shaded from strong sunshine.

The population of a stock managed thus attains enormous proportions and will throw swarms, if allowed, weighing from 7 to be. But under the combined conditions of shade, ventilation, room, and laying space for the queen, they rarely as yet attempt to swarm. The trouble comes when the first or second tier of supers is becoming filled with comb, and honey is coming in faster than combs can be built to contain it. Every empty cell in the hive below is pressed into use for its temporary accommodation; the bees can only cluster in the narrow spaces between the now bulging combs, the queen is becoming pressed for want of cells to lay in, and altogether the conditions seem to necessitate swarming. In the nick of time, however, another tier of supers is added, and the cluster of bees at the doorway are enabled to get inside and find work there. A few hours' delay may, however, have led to the starting of royal cells, and in spite of extra super room a swarm pours forth on the appointed day. This might have been prevented by extracting the honey from the heaviest of the combs,

but we were loth to remove the 40 or 60 lbs. of supers to get at the frames below, and so our swarm is in the air. "Well," we say, "it must just go back." Securing it in the usual way in a temporary skep we go to the now half-deserted hive, remove the supers, lift out the frames, cut out every vestige of a royal cell, extract two or three combs and place these or sheets of foundation near the centre, replace the supers, giving more room if necessary, and tumble the swarm down at the door.

By paying closer attention to the necessary conditions I have generally been spared the trouble of this operation a second time; in some few cases no attempt was made to swarm at all, while in others nothing that I could do would prevent it. I have taken away eight out of ten combs, placing sheets of foundation in their stead, yet the bees swarmed again next day, not even leaving royal cells. I have raised the whole hive half an inch from the floorboard, and given tier above tier of empty supers, yet the royal cells. I have raised the whole hive half an inch from the floorboard, and given tier above tier of empty supers, yet the mania was uncontrollable. In one case where nothing else would do I removed the old queen and replaced her by one newly fecandated, and I am of opinion that this will generally end the trouble. On the whole, however, I have come to the conclusion that the non-swarming system rigidly enforced is an impracticability. The plan of limited swarming I shall describe in my next.—WILLIAM RAITT, Beecroft, Blairgourie.

THE BEE TENT AT KILBURN.

THE BEE TENT AT KILBURN.

THE energy of the Secretary of the British Bee-keepers' Association (the Rev. Herbert R. Peel) and of the Committee has secured a place for the industrious insect at the Exhibition of the Royal Agricultural Society, this year held at Kilburn.

The Exhibition was honoured at a quarter to one on the morning of Monday by a visit from H.R.H. the Prince and Princess of Wales and the Royal children. They were duly received by the Secretary and Committee, and with much apparent interest istened to short explanations. The Princess and her family seemed especially delighted with one of the queens in an observatory hive, which at the moment of their passing happened to be posed as she is sometimes represented, but rarely seen, with her retinue of workers all standing head towards her. retinue of workers all standing head towards her.

A tent of 120 feet in length, running by the side of the Hampstead Junction Railway, has been erected and decorated tastefully by escutcheons and banners. On the left as we enter we find a miscellaneous collection of appliances, English and American. Amongst the former is a case illustrating all the varieties and stages of cells, stores, and bees the hive can under any circumstances exhibit. The Americans contribute to this counter, amongst, well-known knicknesks, the Ringham sunday, ameli cumstances exhibit. The Americans contribute to this counter, amongst well-known knicknacks, the Bingham smoker; small perforated boxes carrying a supply of maple sugar for conveying queens by post; sections in varied forms, but not now novel. Honey by English producers in sections, and therefore in saleable form, next attracts attention; but here in quantity and appearance we are distanced immensely by America, Mr. Thurber showing no less than 1½ ton in section boxes of 2 ibs each. The colour of this honey is not to be excelled. It is easied throughout and ing no less than 14 ton in section boxes of 2 lbs. each. The colour of this honey is not to be excelled. It is sealed throughout, and as flat as a marble slab. Respecting its quality opinions differ. Here, the crucial point, England will probably be well able to hold her own; while there is no reason that in flatness, and generally speaking in colour also, we should not run abreast with the best American producers. These sections we commend to the attention of all who would enter the honey market. The tin separator has had hitherto almost all to do with the flatness of the comb, but with this exhibit is shown a specimen of cardboard which must, we think, supersede tin, and which is therefore worthy of careful inspection.

Moving onwards we meet the observatory hives, the bees from which pass through channels to the outside of the boundary fence. Here the Judges (Rev. G. Raynor and Messrs. Carr & Cowan) award first honours to Mr. W. Freeman for a hive of dainty construction, priced at ten guineas. It contains six frames of comb, which when the hive is closed stand together in two sets of three each. The sets are placed end to end against an opening communicating with the exit and entrance channel, and from this opening the bees have access to all the frames. Each frame hangs in a narrow box with glass sides, while the two outer of each set rotate on a pivot placed in the central chamber. When an examination is to be made these outer frames are thrown from an examination is to be made these outer frames are thrown from the fixed central one until they stand as six equidistant rays from the chamber aforesaid, which has a piece of comb crossing it so that the queen can pass without interruption through the middle of the hive from end to end. Second place has fallen to Mr. Brice Wilson, whose arrangement in some respects resembles the one described. The frames are six in number in glass-sided boxes, each of which has a tunnel running from it to the centre of a flat hexagonal stage, upon whose edges the frames can be arranged. The hexagon itself revolves, as does also each frame, thus bringing both sides of all combs under examination without the observer changing his position. The boxes are placed side by side for conservation of heat when the hive is not in actual use. Mr. Abbott stands No. 3 with a much smaller, simpler, and less mostly hive. It hangs bodily, as does a door, so that it can be shut back at pleasure. It does not admit of closing the comba together; but this is a doubtful advantage, since, although heat is saved, the obstructive glass remains, and would prevent the colony

from long maintaining itself without assistance.

Remarks upon the frame hive must remain till next issue. Two tents for displays of manipulation have been erected, and here the competitions in driving and transferring will be held.—F. Cheshirs.

OUR LETTER BOX.

FOWL UNHEALTHY (L. H).—Your bird is sicksning, but the malady is at present in its curable stage: if neglected, it will doubtless end in rosp. We advise you to separate him from the others, to purge him, and afterwards give some pulls of camphor, two the size of a pea, in the evening. Feed him of tood, ground cats or barleymeal slaked with milk. You may continue the camphor till there is a decided improvement. You may also give him for a midday meal some stale bread steeped in strong ale.

for a midday meal some stale bread steeped in strong ale.

HEW NOT HATCHING EGGS (J. R. W.).—A hen cannot sit too closely. We believe the eggs were allowed to get too dry before the moistening took place. The inner membrane was hardened—in fact it was cooked, and nothing would afterwards soften it. It is impossible to over-rate the importance of this process. If a hen steals a nest in a hedge she leaves her eggs at daybreak to feed. The grass at that hour.—3 A.M.—is as wet as a pond. She returns to feed duties, recking with water running from her breast feathers, and in that state settles down. This happens once in twenty-four hours during the whole period of incubation. In a wild bird's nest (Pheasant or Partridge) you may find addled or clear eggs, but you will not find that eleven have run and the remaining number have dead poults or chicks in them. To find a nest containing only eggs that had chicks in it would only prove that mear hatching time the old bird had been scared from her nest and did not return till the poults had died from chill to the egg.

BGGS LEET FOR TWO HOURS (J. B. S.).—They probably will hatch; at

BGGS LEFT FOR Two HOURS (J. B. S.).—They probably will hatch; at all events, you would be wrong not to wait for the result.

STEWARTON HIVE MANAGEMENT (A Contant Reader).—We sympathise deeply with your misfortune, but suspect there must have been something in the process of manipulating the junction of the two swarms which aroused the anger of the bees and cansed the fighting which ended so disastrously; but we will refer your letter to a first-rate authority on the Stewarton management, and communicate his opinion on the causes of failure. That we might not mislead we quoted from his published experience of the Scotch mode of working the Stewarton hive.

REMARKS.

- REMARKS.

 25th.—Wet early, gradually cleared, sunshine by 10.45 A.M., afterwards sunshine and showers.

 26th.—Morning very damp and unpleasant; rest of day dall, with short intervals of sunshine.

 27th.—A pleasant day, but not very bright.

 28th.—Dull early, with a little rain about 9 A.M.; afterwards beautifully fine and bright.

 29th.—A heavy shower a little before noon: rest of day fine and bright.
- and origin.

 29th.—A heavy shower a little before noon; rest of day fine and bright.

 30th.—Fine, but occasionally cloudy; began to rain about 11.30 P.M.; wild

night.

July 1st.—Very heavy rain in the morning, coasing about noon; afternoon overcast with showers; evening fine.

Although the wind has been south-westerly, owing to the frequent rain the temperature is below the average. The rainfall of the first baif of this year has been greater than in the whole year 1864.—G. J. SYMONS.

COVENT GARDEN MARKET .- JULY 2.

THE first natural Strawberries have reached us this week from the South Coast with evident signs of the backward season, the West of England fruit being exceptionally indifferent. Business far from brisk, though best goods are in demand. FRUIT.

From observations taken near London during forty-three years, the average day temperature of the week is 75.6°; and its night temperature 50.6°.

SELECT CAPE AND NEW HOLLAND PLANTS.

E were told some few months back that one of the chief benefits of a war in a strange country was its leading to a great increase in our geographical knowledge; this, however, is a very expensive way of learning geography, and a wretched apology for the horrors of war. Apart from the political and social benefits which are to be the outcome of the present unfortunate war in South Africa

(and which in the interests of humanity all will wish soon ended) we look forward to the introduction of many new and beautiful plants, for amongst our forces there engaged are numerous highly scientific officers and men, close observers of Nature, who will not fail, in spite of their arduous duties, to bring back with them many interesting objects both in the vegetable and animal kingdom. From the Colony of Natal, which will now be more traversed than ever it has been by Europeans, many new plants are yet to come; whilst a large and comparatively unknown territory like Zululand cannot fail to abound in plant treasures, even though they belong to tribes and families which were more cultivated in the old times than the present.

The old times, "the good old times!" How often do we hear this remark from the aged, especially those who delight in a quiet, dreamy, romantic life! Few, however, would attempt to prove that the world in the so-called good old times was half so pleasant a world to live in as these times in which our lot has fallen, or should the attempt be made it would equally fail to convince. Notwithstanding this assertion, however, it is our intention to attempt to convince some of the young gardeners and amateurs that we had in our gardens and greenhouses in "the good old times" many truly beautiful flowering plants that we do not possess now, and which have neither been replaced nor surpassed.

Several reasons have induced us to commence a few brief remarks upon these plants and their culture, not the least being that the public taste seems fast inclining that way. This we attribute to the fact, that whilst during the last twenty or thirty years we have received innumerable species of new plants from all known quarters of the globe, but few handsome greenhouse flowering plants have been introduced in comparison with the numbers of those remarkable for handsome leaves. Our readers, however, must not infer by this reasoning that we depreciate in the slightest degree the charms of those plants the beauties of which are confined to their leaves; instead of such being the case we would yield to none in our admiration of ornamental foliage. Another reason why the Cape and New Holland plants have so slipped as it were out of cultivation during the past twenty years was the increased space required to accommodate the quantities of softwooded plants which the furore for the summer bedding system rendered indispensable. Thus as the treatment of these softwooded plants did not agree with the hardwooded plants of the greenhouse, the latter soon became shabby and unsightly, which ended in their being declared not showy enough to be worth grow-NO. 954-VOL XXXVIL, NEW SERIES.

ing, and consequently numbers of them found their way to the rubbish heap.

We do not denounce bedding-out, be it borne in mind, by any means; yet we must admit that the adherence to the purely geometrical style of bedding produced a gay but very monotonous display, and our changeable and fickle seasons rendered this oftentimes but of short duration. There now seems to be a change coming over the fashion in this respect, and we cannot but think it a very happy onea more restricted geometrical garden, and a greater variety of plants used therein; the abolishing of straight lines of but few kinds of plants from the borders, and substituting of an endless variety of hardy herbaceous and alpine plants, thus coming back to the mixed border, where if a proper selection is made a good display may be produced all the year round. This system has relieved the greenhouses from the superabundance of bedding plants, and so the old favourites are again being sought after: in this search we shall endeavour to assist those who may require some guidance by introducing to their notice from time to time in the pages of the Journal some of the most desirable.

CHOROZEMA.

This genus belongs to the Pea-flowered section of Leguminosæ, and contains many beautiful plants suitable either for home decoration or exhibition purposes. They are mostly quick-growing slender plants, and may be kept to almost any size required either by the judicious application of the pruning knife after flowering, or by keeping a succession of young plants which may be easily obtained from cuttings or from seed. Pot in loam and peat with a good proportion of sand, drain well, and never allow them to suffer from want of water. They enjoy the free air at all times.

C. Henchmanii (fig. 2, page 23), is perhaps one of the most beautiful of the whole genus, requiring also more care in cultivation. Leaves narrow, needle-like, entire, and dark green, the whole plant having a hoary appearance. Flowers produced on a long terminal leafy raceme, bright red, with a spot of green at the base of the standard. It blooms from about the end of April to the end of June. New Holland. 1824.

C. cordatum splendens.—A tall bold-growing variety of C. cordatum. The leaves are ovate, with a heart-shaped base, spiny at the margins, and light green. Flowers in long loose racemes; colour a very showy red, the standard spotted with yellow. It blooms during April and May. New South Wales.

C. superbum.—A slender plant with oblong obtuse leaves, sessile, coarsely toothed at the margins, bright green. Racemes loose, but many-flowered; standard orange yellow, with a spot of pale yellow at the base; wings crimson. It blooms during April and May. New Holland.

blooms during April and May. New Holland.

C. spectabile.—This is a climbing plant, and consequently should not be grown as a bush. Leaves oblong-lanceolate, and bright green. Flowers orange red, produced on long drooping racemes during the winter and early spring months. Swan River. 1840.

C. Laurencianum is perhaps one of the strongest growing of the whole genus. Leaves oblong-ovate and bright green.

NO. 166-VOL. LXII., OLD SERIES.

Racemes many-flowered; colour bright orange and scarlet,

produced during May and June. New Holland.

C. varium Chandlerii.—An improved variety, dwarf and

C. varium Chandlerii.—An improved variety, dwarf and compact-growing. Leaves spiny at the margin and dark green; the long raceme being profusely clothed with its orange and scarlet pea-shaped flowers. It blooms during April and May. The species was introduced from Swan River. 1837.

C. Dicksonii.—This is a very handsome species, one with very large flowers. Leaves lanceolate, entire, bright green, slightly hairy on both surfaces. Racemes profusely laden with its scarlet and yellow flowers during the months of June and July Swan River. 1836. July. Swan River. 1836.

CALLISTACHYS.

A genus nearly allied to Chorozema; conspicuous, as its name implies, for fine spikes of large showy flowers, which are pea-shaped. They are quick-growing plants, and may easily be formed into handsome specimens. Treatment the same as for

C. linearis.—A robust-growing plant and freely branched. Leaves linear elongated, mucronate, edges slightly revolute, some 3 inches long, bright green. Racemes terminal. Flowers large; standard dull reddish purple with a spot of dark purple at the base. Wings dark purple. It blooms during the autumn months. Swan River. 1838.

C. longifolia (fig. 4, page 31).—This very handsome species blooms during the months of June and July. Leaves lanceolate mucronate, some 6 inches long, smooth, and dark green above. Racemes terminal, many-flowered; standard bright

yellow; wings purple. Swan River. 1840. C. lanceolata.—An extremely showy species. Leaves lanceolate, acute, dark green, and, like the stem, clothed with long beautiful silky hairs, rendering it even when out of flower very attractive. Racemes dense, terminal. Flowers large, golden yellow. It blooms during June and July. Swan River. 1815.

EUTAXIA.

Another member of the Pea-flowered Leguminosæ. name signifies modesty, and has been given to these plants in allusion to their humble unattractive appearance when not in flower, but when covered with their gay blooms they form splendid ornaments to the greenhouse. Cultivation the same as already given for former genera. They require attention in the matter of stopping the shoots in order to produce lateral branches, or they are apt to become lanky unbranched plants. We prefer seedlings of all the Pea-flowered Leguminosæ to plants obtained from cuttings, as we have invariably found the former made the best-shaped plants.

E. myrtifolia.—An erect-growing shrub with slender stems. Leaves opposite, dense, narrowly lanceolate, with a sharp point, about half an inch long and deep green. Flowers brilliant yellow, in pairs in the axils of the leaves, often clothing the slender stems for more than a foot in length. It blooms during May, June, and July. Western Australia. 1803.

E. Baxterii.—A more compact-growing species than the last-named, but certainly not more graceful. Leaves opposite, obovate, ending in a sharp point, about half an inch long, dark green above, paler below. Flowers axillary, mostly in threes, crowded, forming a dense spike of some 6 inches in length; colour golden yellow, produced during the spring and summer months. Western Australia. 1830.

E. pungens.—This is a very distinct much-branched species, with acicular Heath-like leaves. Flowers axillary, much crowded; colour of standard yellow, the wings rich orange. It blooms during May and June. New Holland. 1825.

AOTUS.

As a genus this is nearly allied to Pultenæa, from which, as its name implies, it is distinguished by the want of the ear-like appendages to the calyx. The members of this genus are for the most part very handsome and well deserve cultivation, many showy species having never yet reached us in a living state. Pot in loam and peat in about equal parts, adding a good portion of sand.

A. villosa (fig. 3, page 27).—A pretty, compact, much-branched shrub. Leaves verticillate, in threes, narrowly oblong, ending in a hair-like point, light green and villous on the upper side. Flowers axillary, bright canary yellow; the standard streaked with crimson lines. May and June. New

Holland. 1790.

A. gracillima.—This is a very slender graceful species. The Leaves are small and linear, obtuse and dark green. Flowers

axillary, bright yellow, and produced in such profusion as to entirely hide the leaves, leaving the slender stems like long dense racemes of flowers. It cannot fail to charm everyone with its heauty. It blooms during May and June. West with its beauty. lt blooms during May and June. Australia. 1844.

RUST ON GRAPES.

THE theory advanced by "A KITCHEN GARDENER" that this is caused by thinning with damp and dirty scissors will not bear much examination; for in the first place, to a close observer, the rust can often be seen before the scissors are brought into use, in fact before the whole of the flowers on a bunch have set. Secondly, the rust is not confined to the parts where the scissors would be most likely to touch, but in bad cases is all over some of the berries. I could give many more reasons, but a third, and that a rather pointed one, must suffice. Four or five bunches of Muscats which flowered and set earlier than the rest are rusted; the others, probably three hundred bunches, in the same house, of the same variety, and indeed on the same plants, for there are only four Vines in all, have no rust. The rusted bunches, as well as a good portion of the others, were thinned by my own hands. Well, then, here am I in company with, I am afraid not a few, according to "A KITCHEN GARDENER'S" judgment, guilty of thinning with damp and dirty scissors. I plead guilty to that charge, and further, I will own that I am past reformation in this particular, and for this reason—my scissors get dirty and damp by the time I have cut through half a dozen stems, and I could not afford the time to polish them up as often as that. I clean them when the dirt accumulates so that they do not work freely, say once in an hour, and I prevent them injuring the berries by the simple expedient of not allowing berries and scissors to come in contact. If in thinning the scissors touch the berries it proves that either the operator is not efficient or the work has been too long deferred.

Well, then, having proved to my satisfaction, and I hope to "A KITCHEN GARDENER'S," that his theory is wrong, I shall be expected to put something in its place. It was not sulphur which caused the rust, for none was used. It was not syringing, for my Vines have not been syringed for several years. Neither was it steam from the pipes, for the pipes are amply sufficient without making them very hot, and the evaporating pans have never been used. It was not a cold draught, for the house is so constructed that sufficient air can be given without the cold draught reaching the Vines; but nevertheless I have no doubt it was caused by faulty ventilation. Rust, scalded berries, and scorched ends of shoots are all caused by the same thing—viz., giving air (perhaps two minutes) too late. One mistake this way is quite sufficient to disfigure, if not to spoil, a whole house at such a critical time as when the flowers are just setting, and had mine all been so forward as the few bunches in question at the moment the mishap occurred I should now have to deplore the disfigurement of the entire crop instead of looking forward hopefully as I do to the best house of Muscats I have ever grown. In our modern lightbuilt houses the temperature rises so very rapidly when the sun touches them that giving air properly is the one great

thing to learn.

l have written so much on this subject at different times that I must not enlarge on it now, for a friend once told me I never wrote about anything else besides giving air. However, I will say a standing rule with me is never to wait for a rise of temperature, but give air in advance, and allow the temperature to rise afterwards. Practice only in a given place and a study of the wind and clouds will teach each one how to act for himself.

I would urge on all who grow Grapes which they wish to keep through winter to apply plenty of fire heat so long as the cold weather continues. If Grapes do not begin to colour by the end of July or the first week in August they will not keep well. It is all very well to talk about doing without fire heat in summer, but I do not call it summer when the thermometer goes nearly down to 40° night after night, though it be the month of July. We had no summer in 1860, and such a thing might occur again in spite of the hot-weather prophets .-WILLIAM TAYLOR.

STRAWBERRIES FOR FORCING-LIQUID MANURE.-In a recent issue of your valuable paper Mr. Ogle recommends liquid manure to be given to Strawberries for forcing as they throw up their flowers. As the practice is in almost direct opposition to what we practise here I should like to have the opinion of some of your readers upon the subject of liquid manure for Strawberries to be forced. My present master never allows his Strawberries to receive liquid manure until after the fruit is set; then any quantity is given. He contends that Strawberries will not set their fruit if they receive any stimulant, such as liquid manure, before the stage mentioned. He grows very good fruit; President over 2 ozs. each. Mr. Ogle's practice is entirely new to me, which makes me desirous of having the practice of some other of your correspondents.—A FOREMAN.

NOTES ON PANSIES.

I NOTICED lately in one of your contemporaries that Pansies mised in the north do not succeed when grown in the south. I find it impossible to grow some of the varieties introduced from the south, and I am this season trying in a frame the varieties lately received from the south. Mr. Hooper of Bath is the grower one turns to as representative of the southern growers; and though I do not find his introductions in some instances up to the standard of the Scotch raisers, at the same time the varieties of which Robert Parker may be taken as a type are quite distinct from anything we have here, and exceedingly attractive in colouring; but it is these varieties that are difficult to grow and to produce good flowers. At the same time some of the introductions of Mr. Hooper are the freest-growing and most floriferous of any we have. Instances in point are King Koffee, Jupiter, Brilliant, and Mrs. Felton, besides many more which would be much regretted if lost.

But doubtlessly the Pansies of the future will be produced from the section known as Fancy. There is a marked improvement in these year by year, the rich and varied colouring of the flowers having in addition that distinctness in the markings, besides the form of the blooms being brought to that standard so dear to the florist in all his dealings with Nature. And then there is no difficulty whatever in growing the varieties of the Fancy section. All they require is a rich well-worked soil in the first place to be planted in, and throughout the summer an occasional clearing-off of the seed pods and withered blooms, when flowers will be continuously produced right on during summer and until the damp and cold of autumn put a star to the flowering of most plants.

cold of autumn put a stop to the flowering of most plants. Pansies are strictly perennials, and although it is necessary to keep up a stock of young plants from cuttings in order to obtain large and fine blooms, it is not at all necessary to do so in ordinary cases. We have plants dotted in front of borders which have occupied the same position these last three years, and in early summer these old plants make a particularly fine display. I may have something more to say about Pansies before long.—R. P. B.

ARTIFICIALLY NETTED VICTORY MELON.

We were somewhat surprised to see the article on this subject (page 6) in last week's Journal. We have certainly been much deceived in the "Netted" Victory Majon, having purchased seed under the impression that the Melon from its appropriate name would be handsomely netted. It is a very good Melon, but with us has scarcely shown any signs of netting, some fruits not having the slightest trace on them. We had concluded the absence of netting on our fruits had been due to some fault in their cultivation. Since the notes in the Journal we may safely decide that the non-netted fruits are characteristic of the variety, and the fault not ours. We think that this artificial system of Mr. R. Gilbert's may be rightly adopted as far as fruits for home consumption are concerned, but it is another thing to exhibit them and gain honours for them when the judges are left in ignorance of the mode that has been adopted to represent an important property that the Melons do not naturally possess. Had Mr. Gilbert exhibited his Melon under its right name of "Artificially Netted Victory," and had it been sold under that name, no one would have been deceived. Enough has been written lately about questionable practices in exhibiting, and the sooner they are put a stop to the better.

Further, many of the new Melons that are now purchased do not when grown answer to the description given of them. For instance, we have now hanging fruits of "Mann's New Hybrid" Melon fully a foot long in our Melon house more like Pumpkins or Vegetable Marrows than like the Melon ex-

hibited by Mr. Mar n at the last Manchester Show. All the plants raised from a packet of seed are alike, g This is a great annoyance, and the two facts named must naturally make.

Fig. 2.—Chorozema Henchmanui (sec page 21).

gardeners besitate before ordering new varieties of Melons in future.—W. BARDNEY.

JAPANESE AND CHINESE PLANTS.—I do not think that the unusual growth of the plants referred to on page 472 can be attributed to the absence of frosts during the spring. The spring frosts killed all my Antirrbinums, many Wallflowers, Pinks, &c., as soon as they had put forth their young shoots. In fact my attention to this subject was first attracted by the strong and healthy growth of Dianthus Heddewigii, when so

many of its garden contemporaries were killed or much injured this spring by the very trying changes from warm to frosty nights and vice versa well into May. In March it was singularly trying, the minimum temperature during night being 23°; at 10 A.M. 35° in shade, 53° in sunshine; on another occasion 26° at night; 38° in shade at 10 A.M., 61° in sunshine; and on one occasion in March or April my thermometer facing the sun at 10 A.M. was 55°, another in the shade stood at 29°a difference of 26°. The extraordinary changes of temperature this spring have been as trying to many frail individuals as to plants.—G. O. S.

[In consequence of the protracted winter the growth of many plants and trees was much retarded, and thus escaped injury by spring frosts. This was the case with all kinds of fruit blossom, Chestnut flowers, &c., which were unusually fine this year. The young growths of Roses have rarely been injured by frost this spring, and Dielytras and other plants of that nature have enjoyed the same immunity in the south, and have therefore grown and flowered with great freedom.—EDS.]

ALEXANDRA PALACE ROSE SHOW .- JULY 5TH.

THE date fixed for this Exhibition gave hopes that it would prove rather more successful than that held at the Crystal Palace last week, and to some extent these hopes were realised; but the weather continues unpropitious to Rose-growers, and although the entries were sufficient to fill all available space, yet many noted rosarians were unable to compete, and consequently some

noted rosarians were unable to compete, and consequently some unpleasant gaps were here and there evident.

"How," writes Rev. Alan Cheales, "Mr. Baker was able to show such Roses in such a season is a perfect marvel! Most of the boxes showed evident traces of the pelting and buffeting which we have been daily undergoing; but his might have come out of a glass house, and lovely indeed they were! Mrs. Baker almost the most charming of all. I noticed in his selection besides, especially Mayie Roument, Comilla Rormordin, La France, and smoot the most charming of an. I notice in his section of states, especially Marie Baumann, Camille Bernardin, La France, and Marquise de Castellane. La France and Duke of Edinburgh are decidedly good this year. Mr. Prince had a wonderful Alba Rosea. Mr. Cant's Marie Baumann and John Hopper were grand; as also Michelon and Marie Finger in a box of Mr. Curtis. Mr. G. Paul's box of forty-eight triplets contained also some very fine Roses, though there were enough damaged Roses to reduce ine Roses, though there were enough damaged Roses to reduce him to a second prize. His Henri Ledechaux far surpassed anything I had supposed that Rose capable of. Sultan of Zanzibar was grand, as also were La Rosière and Ferdinand de Lesseps. The Show was held in a large dining-room upstairs; and oh! such a cruel number of steps to mount up! The authorities should have pity upon heavily loaded Rose boxes. The Show must have been satisfactory, but there were very many gaps, and still the Rose opening season can hardly be said to have arrived."

In the nurserymen's classes the competition was good, and among the numerous collections staged were several of special merit. Of the five exhibitors in the class for seventy-two distinct varieties Messrs. Keynes & Co. Salisbury, justly obtained the premier award for an even collection which included some really fine blooms. The varieties were Madame Sertot, Marréchal Vallary Deiroses Meyr of Combridge Prince Camilled & Rober. the premier award for an even confection which account really fine blooms. The varieties were Madame Sertot, Maréchal Vaillant, Princess Mary of Cambridge, Prince Camille de Roban, Boule de Neige, Auguste Rigotard, La France, excellent; Charles Lefebvre, good; Duchesse de Vallombrosa, Maurice Bernardin, Etienne Levet, Cheshunt Hybrid, Elie Morel, Monsieur Gabriel Tournier, Madame Nachury, Exposition de Brie, fine; Fisher Holmes, Marie Van Houtte, Souvenir d'Auguste Rivière, Climbing Descripancies Horace Varnet, Marie Baumann, good; Abel Grand. Tournier, Madame Nachury, Exposition de Brie, fine; Fisher Holmes, Marie Van Houtte, Souvenir d'Auguste Rivière, Climbing Devoniensis, Horace Vernet, Marie Baumann, good; Abel Grand, Mdlle. Eugénie Verdier, Beauty of Waltham, Reine du Midi, Duc de Rohan, Capitaine Christy, Dr. Andry, Princess Beatrice, fine; Mons. E. Y. Teas, Madame Victor Verdier, Pierre Notting, Madame Laurent. Sir Garnet Wolseley, Maréchal Niel, Camille Bernardin, Richard Wallace, General Douai, Victor Verdier, Clotilde Rollande, Star of Waltham, fair; Mdlle. Marie Rady; Devoniensis, well formed; Louis Van Houtte, good colour; Ferdinand de Lesseps, Madame Willermoz, Duke of Edinburgh, La Rosière, Royal Standard, Général Jacqueminot, Lord Macaulay, Sénateur Vaisse, Dupuy-Jamin, and Centifolia Rosea. Messrs. Curtis, Sandford, & Co., Torquay, obtained the next position with blooms of medium quality generally, but some were highly meritorious, particularly Comtesse de Serenyi, Marguerite Brassac, Princess Mary of Cambridge, Sénateur Vaisse, and Baronne de Rothschild. The third prize fell to Messrs. Paul & Son, Cheshunt, who staged small but good flowers. Messrs. J. Mitchell and Sons, Uckfield, Sussex, secured the fourth prize, and an extra one was awarded to Mr. W. Farren, Cambridge.

There were only two collections of forty-eight triplets. Messrs. Keynes & Co. were again first, and Messrs. Paul & Son second. There were five competitors in the class for twenty-four triplets. Mr. B. R. Cant, Colchester, secured the premier position with acollection that comprised was fire flowers. Messrs. Curtis & Co.

Mr. B. R. Cant, Colchester, secured the premier position with a collection that comprised many fine flowers; Messrs. Curtis & Co. |

followed with fresh blooms; Messrs. Keynes & Co. were third with rather rough flowers; and Messrs. Paul & Son fourth.

The exhibits in the class for single trusses of twenty-four dis-

The exhibits in the class for single trusses of twenty-four distinct varieties were very numerous, for no less than ten were staged. Mr. B. R. Cant's premier collection contained excellent examples of Duke of Edinburgh, Madame Thérèse Levet, Baronne de Rothschild, Charles Lefebvre, Souvenir d'un Ami, Maréchal Niel, La France, Hippolyte Jamain, Prince Arthur, Sénateur Vaisse, Marie Baumann, Mrs. Baker, John Hopper, Maurice Bernardin, and Rubens. Mr. W. Corp, Oxford, was a good second; Messrs. Keynes & Co. third; Messrs. J. Laing and Co., Forest Hill, fourth; and Mr. W. Farren was awarded an extra prize. In the class for twelve Tea or Noisette Roses six exhibitors appeared. Mr. George Prince, Oxford, was placed first, and in his collection the following varieties were well represented—Marie Van Houtte, Maréchal Niel, Alba Rosea, Catherine Mermet, Rubens, Souvenir d'Elise, Amazon, Comtesse Nadaillac Madame C. Kuster, Souvenir d'un Ami, and Elise Sauvage. Messrs. J. Mitchell & Sons were second (flowers rather small); Mr. B. R. Cant third, and Mr. B. Cooling, Bath, fourth.

J. Mitchell & Sons were second (nowers rather small); Mr. B. R. Cant third, and Mr. B. Cooling, Bath, fourth.

The amateurs appeared in strong force. Mr. R. N. G. Baker's exhibits cannot be too highly praised, for, considering the unfavourable season, his Roses were all that could be expected or desired. in form, substance, and colour. That the high merit of his flowers was appreciated by the Judges is evident from the fact that he was placed first in the three principal classes—viz., for forty-eight and thirty-six single trusses and twenty-four triplets. The collection of forty-eight possessed particular excellence, and attracted admiration not only from the critics but the majority of visitors also. the varieties in this class were mostly the same as those exhibited by Mr. Baker in the two following classes it will be unnecessary to repeat them after noting the forty-eight varieties. One of the grandest blooms in this excellent collection was La France, in exgranuest blooms in this excellent collection was La France, in exquisite condition but somewhat pale. Mdlle. Eugénie Verdier, Lord Macaulay (fine), Marquise de Castellane (good), Victor Verdier, Docteur Andry, Hippolyte Jamain, Marguerite Brassac, Duke of Wellington, Monsieur Etienne Levet (large), Abel Grand. Maréchal Veillent Castellane Chita. Wellington, Monsieur Etienne Levet (large), Abel Grand, Marechal Vaillant, Capitaine Christy, Marquise de Gibot, Duke of Edinburgh, Dupuy Jamin, Duke of Connaught, Countess of Oxford, Charles Lefebvre, Clotilde Rollande, Prince Camille de Rohan, Ferdinand de Lesseps, Annie Laxton, Marie Baumann, John Hopper, Mrs. Baker, Maurice Bernardin, Anguste Rigotard, Madame Nachury, Xavier Olibo, Sultan of Zanzibar, Princess Mary of Cambridge, Thomas Mills, Mons, Gabriel Tournier, Centifolia Rosea, Reynolds Hola Madame Victor Verdier, Souvenir de Charles Montault. Thomas Mills, Mons. Gabriel Tournier, Centitolia Rosea, Reynolds Hole, Madame Victor Verdier, Souvenir de Charles Montault, Mons. E. Y. Teas, La Rosière, Royal Standard, and Marguerite de St. Amand. The second prize was accorded to Mr. T. Jowitt, Old Weir, Hereford, whose flowers were very good but yet inferior to the foregoing in several points. Mr. G. Rushmere, gardener to Sir C. Rawley, Bart., Colchester, and Mr. J. Davis, Wilton, followed in the order mentioned. There were six exhibitors in this class. In the class for thirtx-six single trusses Mr. Reker's collec-

in the order mentioned. There were six exhibitors in this class. In the class for thirty-six single trusses Mr. Baker's collection was the principal feature, but several of the seven other competitors staged very good blooms, especially in the second-prize collection from Mr. W. Smith, gardener, Bird Hall, Colchester. Mr. J. L. Rushmere was a close third, and Mr. W. Harrington, Romford, fourth, an extra award being secured by Mr. J. Brown, gardener to A. J. Waterlow, Esq., Reigate. Mr. R. N. G. Baker was followed in the class for twenty-four triplets by Mr. Joseph Davis and Mr. T. Jowitt, both of whom sent flowers of only medium quality. Mr. J. Hollingworth would have had the second prize in this class but for a mistake made by the exhibitor in naming a bloom of Duke of Edinburgh by the exhibitor in naming a bloom of Duke of Edinburgh Louis Noisette, his stand thus including two blooms of the Duke. A stand exhibited by Mr. Brewster, gardener to J. Reid, Esq., in the class for twenty-four blooms, also contained two examples of Duke of Edinburgh, one of them incorrectly named Duchess of Edinburgh, the Hybrid Perpetual Rose of that name being a silvery peach colour, and the Tea Rose of the same name rosy crimson. There were five entries of twenty-four varieties (single trusses), and the principal position was allotted to Mr. W. H. Wakeley, Rainham, the principal position was allotted to Mr. W. H. Wakeley, Hainham, Kent. The remaining prizes were secured by Mr. Edwards, gardener to the Rev. Canon Tarver, Mr. J. Gravelly, Sussex, and the Rev. E. L. Fellows, Royston, in the order mentioned. There was good competition in the class for twelve single trusses, for ten exhibitors contested for the prizes. Mr. Edward Mawley, Croydon, was an excellent first with Devoniensis, Madame C. Joigneaux, Mermet. Mdlle. E. Verdier, Marie Van Houtte, Canna d'Habb. Chaire met, Mdlle. E. Verdier, Marie Van Houtte, Coupe d'Hébé, Gloire de Dijon, Centifolia Rosea, Rubens, and Dr. Andry. Mr. J. Edwards, Mr. J. P. Hawtrey, and the Rev. Alan Cheales, Betchworth, followed, but the flowers were scarcely so fine as could be desired. Seven competitors entered the lists with collection of twelve Teascented or Noisette Roses, and Mr. T. Jowitt won the honours with good blooms of Belle Lyonnaise, Cheshunt Hybrid, Marechal with good blooms of Belle Lyonnaise, Cheshunt Hybrid, Maréchal Niel, Niphetos, Marie Van Houtte, Cloth of Gold, Moiré, Homère, very rich; Devoniensis, Souvenir d'un Ami, Madame Bravy, and Rubens. Mr. W. Smith was second with an even collection, which included excellent examples of Solfaterre, Madame Bravy, and Maréchal Niel. Mr. J. P. Hawtrey was third, Mr. W. Harrington fourth, and Mr. W. H. Wakeley obtained an extra prize.

The open classes were poor, very few exhibits being staged, and 'above have been in any way protected, though within five miles cose not first-rate in quality. For twelve distinct Roses sent out of Liverpool in a garden facing east.—J. W. those not first-rate in quality. For twelve distinct Roses sent out during 1877, 1878, and 1879 Messrs. Curtis, Sandford, & Co. were placed first with Princess Charlotte de Tremouille, Penelope Mayo (good), Mademoiselle Marie Verdier, Catherine Bell, Souvenir Mayo (good), Mademoiselle Marie Verdier, Catherine Bell, Souvenir d'Auguste Rivière, Marquise Adèle de Murinais, Gabriel Luiset, Madame Albanie, Mons. G. Tournier, Egeria, and Madame Sophie Fripot (good). Messrs. Keynes & Co. were the only other exhibitors. For six trusses of any Rose sent out during 1877-8-9, Messrs. Paul & Son, Cheshunt, were first with poor blooms of Emily Laxton, and Messrs. Curtis, Sandford & Co. were second with indifferent specimens of Mabel Morrison.

Messrs. Paul & Son were the only exhibitors of eighteen trusses Messrs. Paul & Son were the only exhibitors of eighteen trusses of English-raised Roses in commerce. The first prize was awarded for the collection, of which the best were Cheshunt Hybrid, Black Prince, Mrs. Baker, Duke of Edinburgh, John Hopper, Peach Blossom, Magna Charta, Sultan of Zanzibar, Annie Laxton, Charles Darwin, Emily Laxton, Prince Arthur, Miss Hassard, Marchioness of Exeter, Princess Beatrice, Reynolds Hole, and Oxonian. Messrs. Paul & Son were again the only exhibitors in the class for twelve trusses of Excelibration Processing Services. in the class for twelve trusses of English-raised Roses in com-merce or not yet sent out. Messrs. Curtis were the only exhibitors of twelve trusses of Baronne de Rothschild, and they secured the first prize with excellent blooms. The same exhibitors were also first with twelve trusses of La France, and well they merited the position. Messrs, Keynes & Co. were placed second with blooms but little inferior to the others. There were three collections staged in the class for twelve trusses of Marie Baumann; and Mr. J. L. Curtis, Chatteris, Cambridgeshire, secured the first prize with very good and even blooms; Messrs. Curtis & Co. followed with smaller flowers. Mr. J. Davis, Wilton, exhibited the only collection of twelve trusses of Marechal Niel, and obtained the premier award with blooms of average merit.

Only one certificate was awarded, and that was to Messrs. Paul

Only one certificate was awarded, and that was to Messrs. Paul and Son, Cheshunt, for Duke of Teck, a seedling Rose of the Duke of Edinburgh type, but much brighter in colour; it is brighter even than John Bright, the smooth crimson petals being distinctly suffused with scarlet. Being a free grower and bloomer the Duke of Teck must be pronounced a Rose of great promise.

The following miscellaneous collections were highly commended:

—Cut Roses from Messrs. W. Paul & Son, Waltham Cross; Pansies, exhibited by the West of England Pansy Society and Mr. T. S. Ware, Tottenham; succulent plants from Mr. Boller, Kensal New Town, Mr. T. S. Ware also exhibited a collection of extremely good Pyrethrum flowers and Pæonies. Mr. B. S. Williams contributed a large and elegant group of choice plants. Williams contributed a large and elegant group of choice plants.

THE PEAR CROP OF 1879.

THE high hopes entertained when the trees were in bloom of a good Pear crop have, since the setting and shading process is over, been sadly disappointed, at least with many growers, and especially in the case of some varieties. We have here, however, on the wall, aspect west, the following varieties, all of which will be allowed to produce a fair crop of what at present promises to be very fine fruit. Brown Beurré, October. White Beurré, September. Dunmore, September and October. Jargonelle, August. Joséphine de Malines, winter and spring. Gansel's Bergamot, two trees on same wall; the finest crop of this variety I have seen; an October and November Pear, well known not to be surpassed for flavour in the case of espalier and other dwarf-trained trees. Louise Bonne of Jersey, Seckle, amd a few others are bearing well.

I will another time note the varieties that have failed to

fruit this season after showing an abundance of bloom. With the assistance of the "RECTOR" let us hope to be able to proceed with a Pear election before planting time in autumn, the result of which will be useful to all interested in the culture of this proverbially favourite fruit.—R. H. C., Oxon H ath.

EFFECTS OF THE WINTER.—Now that we have got into July (I was going to write summer) I can speak with certainty of what has not been killed in the borders by the extreme cold of the late winter and spring. The Narcissuses have not only survived but they have bloomed splendidly (by-the-by, how far superior they are in the border to the Daffodils) quite equal to the imported bulbs bloomed under glass, which latter are now out in the borders and will remain there, the earth round the roots not baving been disturbed. The Funkias also are all vigorous, their handsome foliage being very attractive. To the above must be added Pansies, Violets, Pinks, Carnations, Sweet Williams, Polyanthus, Irises, Symphytum officinale folvar., Geum coccineum plenum, Lilium album, Lychnis chalcedonica, Statice incana, Senecio pulcher, Enothera Youngii, Spirzea japonica, Hydrangeas, and Dielytra spectabilis. The

THE LATE NATIONAL ROSE SHOW.

IT requires a lover of Roses to exercise much self-control when commenting on a show that can only be called a total failure, but at the same time the truth should be spoken. Six weeks ago Mr. Cant, and Mr. Cranston, and other great rosarians warned Mr. Domorain that the season was unusually late, that the fixture was far too early, and that the date should be altered; but he turned a deaf ear to all remonstrances, and not till Wednesday, after the entries were received and the truth of the warnings proved, did he attempt to alter the fixture. This then was an impossibility.

The largest trade cultivators of the Rose did not show a bloom. No amateur staged forty-eight. Mr. Baker, who has an exceptionally sheltered garden in Devon, could only bring an indifferent thirty-six, for which he was second, while for twenty-four he was placed fifth. Mr. Jowitt could only show a box of Teas and a twenty-four. The Rev. Canon Hole and Rev. E. N. Pochin, two of the greatest amateurs, could not show a bloom. There were only two stands of seventy-two. Mr. Curtis, who took the first prize, had some good blooms; and Mr. May of Bedale, who was second, cut entirely from under glass. Messrs. Keynes & Co. showed forty-eight trebles, but it was hard to find a really good one. He was easy first in this class it is true, but at an average exhibition he would have been nowhere. Perhaps the best box was thirty-six staged by Messrs. Kinmont & Kidd, nurserymen of Canterbury. Here were fine blooms of Emma All, Annie Laxton, Marie Cointet, and La France. There was indeed one magnificent bloom in the Show, and that was staged by Mr. Jowitt-Niphetos, perhaps the finest specimen ever seen of this tender variety. Messrs. Mitchell of Piltdown had some fine Teas, but these were not to be compared with those he showed last year. Many boxes of Marechal Niel were exhibited, but all were unequal.

Everywhere you saw signs of the awful weather we have had—here and there great gaps in the staging, and whole classes without a single exhibitor. Even the members of the orchestra, who are not supposed to know much of Roses, made remarks upon the poverty of the Show: "Never have I seen such a poor lot of Roses here before." It is useless to give you more details of this so-called Exhibition; it would only be filling space by repeating the same thing—failure in every department. Their Royal Highnesses the Duke and Duchess of Connaught attended the Show, and what they thought of it I know not; but it is heartrending to think that the Royal bride should form her first and perhaps last notions of what a National Rose show is in the land of her adoption from the miserable Exhibition of the 28th ult.—WYLD SAVAGE.

READERS of the Journal were prepared by the Hon. Secretary's notice of June 26th for the extreme difficulties under which the Show was held. Never was there such a season! Owners of four or five thousand Roses found it impossible to cut four or five blooms. It was a terrible elemental failure. It must have been for the Association a great financial success. Certainly the Treasurer never wished or expected to find so many prizes unclaimed. As many of us had expected, the leviathans did not have their fight for the cup. It is now relegated to next year by a vote of the Committee, when at last Mr. Cranston's splendid present to the Society is to find a perma-Perhaps there never was a show in which one nent owner. Rose more distinctly overshowed all the others. Everyone who was there will at once think of Mr. Jowitt's marvellous Niphetos, which for size, shape, and yet delicacy, was certainly the very finest Tea Rose I have ever seen.

I have said the National Rose Show was a financial success: what is more it was great, a solid one, and though far the smallest the Society has ever held (or, I hope, ever will hold), it is also to be remembered as having been the first graced with a special visit of Royalty. The sight was a very striking one as the Duke and Duchess of Connaught advanced with a flourish of trumpets along a carefully roped in space up the vast nave of the Crystal Palace, attended by the Palace officials, and received on the borders of Roseland by the President, Treasurer, Secretaries, and Committee of the National Rose Society, and received the presents recorded in your report of the Show. The Royal procession then swept on, and the crowds returned to the study of the Roses. Six o'clock is the latter never were stronger or more full of bloom. None of the time for removing the boxes, but they were still being eagerly

inspected at that hour. The Crystal Palace Company may be congratulated that, if the National Rose Society's Roses come short, certainly the British public was sufficiently largely represented.—A. C.

ROYAL HORTICULTURAL SOCIETY. ROSE AND PELARGONIUM SHOWS .- JULY 8TH.

ALTHOUGH the Royal Horticultural Society was the first to perceive the necessity for postponing the date of their Rose Show, yet the time gained from June 24th to July 8th has not proved sufficient for Roses to be in the zenith of their beauty, and southern growers still maintain their advantage; yet, notwithstanding the protracted cold weather, the display, though not large, was much the finest of its kind that has been seen this year, and was greatly enjoyed by the numerous visitors. The season, too, has been almost equally unfavourable for Pelargoniums, bright sunlight being essential for the production of sturdy plants and numerous and bright trusses of flowers. Still the Society's Show was an excellent one, a marked improvement being apparent Show was an excellent one, a marked improvement being apparent in many of the classes. The first half of the long tent leading from the Council-room to the large marquee was laid out as a Rose garden by Messrs. William Paul & Son, Waltham Cross, the memaining half being occupied with plants and cut blooms in competition for the prizes offered by the Pelargonium Society. mounds in the principal marquee were clothed in an artistic manner by nurserymen, florists, and amateur exhibitors of mis-cellaneous plants, the boxes of Roses in competition forming a beautiful margin to the prominent groups. The blooms were perhaps fully too low to be examined with advantage, for many of them were worthy of close examination, the improvement in the condition of the Roses exhibited in comparison with those staged at the Alexandra Palace on Saturday being very striking. Mr. Turner, however, was unable to exhibit at all, and Mr. George Paul states that a week or more will elapse before his Roses are in their best condition.

The schedule only contained eleven classes—four for nursery-men, three for amateurs, and four open classes, and we will refer

to them in the order of their arrangement.

NURSERYMEN'S CLASSEN.—In the class of forty-eight single trusses five collections were staged, the awards going in the following order. First, Messrs. Curtis, Sandford & Co., Torquay; second, Messrs. Paul & Son, The Old Nurseries, Cheshunt; third, Messrs. Keynes & Co., Salisbury; and highly commended, Mr. B. Gant, Colchester. All these stands contained some really fine Roses, quite surpassing those at previous exhibitions this year. In the first-prize collection François Michelon was grand, and the fellowing very good—Charles Lefebyre, John Hopper, Mons. G. Tournier, Duke of Edinburgh, Marquise de Castellane, Magna Charta, Mons. E. Y. Teas, Général Jacqueminot, Beauty of Waltham, La France, and Sir Garnet Wolseley. Messrs. Paul staged the finest bloom we have seen of Alfred K. Williams, a bright, full, symmetrical Rose, somewhat of the form of Marguerite Brassac but much more scarlet. Mons. Noman, Etienne Levet, Ferdinand de Lesseps, Marie Baumann, Mons. E. Y. Teas, and Victor Verdier were very fine in the same stand. Messrs. Keynes' blooms were generally smaller, the best being Marguerite Brassac, La France NURSERYMEN'S CLASSEN.—In the class of forty-eight single were very fine in the same stand. Messrs. Keynes' blooms were generally smaller, the best being Marguerite Brassac, La France, Senateur Vaisse, and Sir Garnet Wolseley. Mr. Cant exhibited a grand Duke of Edinburgh, a fine Etienne Levet, and very good examples of Sir R. Wallace, Prince Arthur, and Thomas Mills, vary bright. W. Farren, Esq., How House, Cambridge, was the remaining exhibitor, but he evidently had to cut "hard" to make up his stands.

In the class for twenty-four triplets Messrs. Curtis & Co. were again in the foremost position. Remarkably fine were Mons. G. Tournier, Genéral Jacqueminot, John Hopper, Antoine Ducher (splendid), Princess Beatrice, La France, François Michelon (grand); and conspicuous was the very dark Abel Carrier. Messrs. Paul & Son were second, Sultan of Zanzibar and La Rosière being very rich, Ferdinand de Lesseps and Duke of Edinburgh extremely bright, and Abel Grand charming. centremely bright, and Abel Grand charming. Messrs. Keynes and Co. were third, the blooms being somewhat irregular, John Hopper being decidedly the best; but La France, Ferdinand de Lesseps, and Mons. E. Y. Teas were good. Mr. Cant also exhibited in the

In the class for twenty-four single trusses Mesers. John Laing and Co., Forest Hill, secured first honours with fresh and well-coloured blooms, but somewhat smaller than those in the preceding classes; their excellence, however, was sufficient to place them before Messrs. Curtis & Co. who were second, third honours going to Messrs. Keynes. Mr. Farren exhibited very well in this class. Five collections were staged, the best varieties being enumerated above. In the class for twelve blooms the prizes went to Mesers, Curtis, Keynes, and Laing in the order named, all staging remarkably well.

Etienne Levet, Lord Macaulay, Baronne de Rothschild, Sultan of Zanzibar, Beauty of Waltham, Mrs. Baker (grand), Mons Noman, Marguerite Brassac, Duchesse de Vallombrosa, Duke of Edinburgh, La France, Dr. Andry, Marie Baumann, Fisher Holmes, Marquise de Castellane (very fine), Prince Camille de Rohan, Clotidle Rolland, Duc de Wellington, Marguerite de St. Amand, Maréchal Vaillant, Mons. E. Y. Teas, Avocat Duvivier, and Dupuy-Jamin—the finest stand in the Show. J. Hollingworth, Esq., Maidstone, was placed second; and Mr. Joseph Davis, The Square, Wilton, Wilts, third. Five collections were staged.

In the class for twelve triplets, Mr. Baker was again far ahead of other competitors. Mrs. Baker, Marie Baumann, Marquise de Castellane, Dr. Andry, Victor Verdier, Mdlle. Eugénie Verdier, and Ferdinand de Lesseps were superb; and very fine were Sultan of Zanzibar, Duke of Edinburgh, Fisher Holmes, and Prince Camille de Rohan. Mr. Hollingworth was second with large flat blooms, Mr. Davis being third with smaller but better coloured and fresher examples, including three Teas. In the class for twelve single blooms G. P. Hawtrey, Esq., Langley Place, Slough, secured the first honours with a stand in which the Teas Niphetos

secured the first honours with a stand in which the Teas Niphetos and Catherine Mermet with Marechal Niel showed to great advantage amongst such fine dark Roses as Mons. E. Y. Teas, Horace Vernet (a fine bloom), and Duke of Edinburgh. Indeed the Teas, contrary to the principle of judging in the preceding class, must have won the prize, for Mr. Baker's second-prize stand contained generally superior blooms, but of nearly all dark Roses.

contained generally superior blooms, but of nearly all dark Roses. Mr. Joseph Davis was third with small blooms.

OPEN CLASSES.—Mr. Hawtrey well won the first position in the class for twelve Teas with charming examples, but somewhat deficient in foliage, of Marie Van Houtte, Niphetos, Catherine Mermet, Madame Willermoz, Souvenir d'Elise Vardon, Maréchal Niel, Souvenir d'un Ami, Rubens, Marie Ducher, Devoniensis, Abbé Roustin, and Jean Ducher. J. H. Pemberton, Esq., Haver-Abbe Houstin, and Jean Ducher. J. H. Pemberton, Esq., Havering-atte-Bower, Romford, was an excellent second, the premier bloom being Madame Caroline Kuster; and Messrs. Keynes and Co. third. Some very excellent blooms were staged in the open class for six of any one sort of Hybrid Perpetual, Mr. Baker securing first honours with compact, charming, and highly coloured examples of Marie Baumann; Mr. Cant being placed second with very large and richly coloured blooms of Duke of Edinburgh, the finest we have ever seen; and Mr. Farren third with La France. Mr. Baker exhibited grand specimens of Marouise de Castellan. nnest we have ever seen; and Mr. Farren third with La France. Mr. Baker exhibited grand specimens of Marquise de Castellane in this class, and Messrs. G. Paul & Son Sultan of Zanzibar, Duke of Edinburgh, and Cheshunt Hybrid. For six Teas of any one sort Mr. Hawtrey was again first with a fine stand of Niphetos. The blooms indeed would have been grand but for the slightly injured outer petals. Mr. Davis was second with Maréchal Niel, and Mr. Farren third with Souvenir d'un Ami of moderate quality.

In the class for six distinct new Roses of 1877 and 1878 Messrs. In the class for six distinct new Roses of 1877 and 1878 Messrs. Curtis & Co. secured the first position with Barthelemy Joubert, crimson; Catherine Bell, bright rose; Egeria, fiesh; Princess Charlotte de Tremouille, salmon pink; and Madame Gabriel Luizet, of nearly the same colour, none of the blooms being of good quality. Messrs. G. Paul & Son were placed second with equally good blooms of Robert Marnock, Alfred B. Williams, Souvenir d'Adolphe Thiers, bright cerise; Princess Charlotte de Tremouille; Mrs. Laxton, very symmetrical but small; and Souvenir d'Auguste Rivière, rich velvety crimson. Messrs. Keynes & Co. were third, Madame Gabriel Luizet, rose, fine form, being very attractive; and Grand Duke Nicholas, very dark but being very attractive; and Grand Duke Nicholas, very dark but flat.

The contribution of Messrs. Wm. Paul & Son above referred to was a very attractive one, and a total change from the Rose Show proper. The space of lawn occupied was 180 feet long and 16 feet wide, and was computed to contain upwards of ten thousand Roses and buds. The returns submitted by Mr. Paul showed that eight thousand Roses were cut on Monday at Waltham and Broxbourne, thousand Roses were cut on Monday at Waltham and Brozbourne, four thousand on Tuesday in the same nurseries, and one thousand on the same day at Framfield; but the whole of these were not employed in furnishing the garden. The plan of arrangement was as follows: A row of specimen Conifers, variegated shrubs, and Ivies were placed down the centre of the tent, the pots and baskets containing them being masked with small Golden Yews, Raphiolepis ovata, and shrubs of that nature. On both sides of Rapholepis ovata, and shrubs of that nature. On both sides of this central row beds were formed in the lawn and filled with a few exceptions with Roses, round beds about 5 feet in diameter and oblongs alternating. From three to nine Roses and buds were placed in each inverted funnel-like cup provided for the occasion, and the whole placed sufficiently close together to form masses of Roses about 9 inches in height. A few examples of these beds may be submitted. The first bed was a round one filled with I wounder the provided for the contract of the second with pink Roses and edged with Lycopods; then came an oblong, the centre being of crimson Roses, and the margin white and rose, edged with Golden Feather; next were two round beds, one filled with crimson the other with creamy yellow Roses, both edged with Selaginella. Then came beds of small Golden Euonymuses and AMATEURS' CLASSES.—In the class for twenty-four single blooms the redoubtable Mr. Baker of Heavitree, Exeter, was in his old position—first, with fine and splendidly coloured blooms, admirably staged. The varieties were Ferdinand de Lesseps,

There were five entries in the class for six Show varieties in pots not exceeding 8 inches in diameter. Mr. James, gardener to W. F. Watson, Esq., Redlees, Isleworth, deservedly obtained the highest position with very handsome specimens of Mary Hoyle, Prince Leopold, Archduchess, Snowflake, Princess of Denmark, and Pompey. Mr. J. Wiggins was second with compact but smaller plants; flowers good. Mr. C. Hammond, gardener to F. Hunt, Esq., Stamford Hill, was third with rather poor plants, and Mr. Charles Turner was fourth. There were four exhibitors in the corresponding class for Fancy varieties. Mr. J. James secured the first prize with large and profusely flowered specimens. The varieties were Ellen Beck, East Lynne, Mrs. Altred Wigan, Mirella (very fine), Princess Teck, and The Shah. Mr. Charles Turner followed with small plants, Mrs. Pope and Mrs. A. Wigan being the best. Mr. James Weir, gardener to Mrs. Hodgson, Hampstead, was third with indifferent plants.

In the class for six Show varieties not in commerce Mr. Charles Turner, Slough, was placed first with small but well-flowered plants. His varieties were Amethyst (Brehaut), a neat flower, groud habit: three lower retails bright purplet two

first with small but well-flowered plants. His varieties were Amethyat (Bréhaut), a neat flower, good habit; three lower petals bright purple, two apper extremely dark with a lighter margin. Constance (Matthews), flower large and well formed; three lower petals pink, upper maroon, white throat. Bertha (Matthews), small flower, bright salmon pink, white throat; dark upper petals. Nero, pinkish crimson; neat flower. Osman Pacha, lower petals reddish pink, upper very dark, white centre. Joe, bright pink; upper petals dark, white centre; large and good, very floriferous. The three latter varieties were also raised by Mr. Matthews. E. B. Foster, Esq., Clewer Manor, Windsor, was awarded the second prize. His varieties were extremely good, but Clewer Manor, Windsor, was awarded the second prize. His varieties were extremely good, but the plants were rather poor. Fireball, good formed flower, very bright scarlet, dark blotches in the centre of the two upper petals; white throat. Renown, good flower; dark upper petals, and the lower reddish pink. Mountain of Light, bright scarlet; dark upper petals; small flower. Hector, vermilion lower petals, dark upper. Valiant, salmon; lower petals vermilion, upper dark; finely formed flowers. Prince Imperial maroon upper petals, lower crimson streaked with a dark shade. These were the only two collections staged.

only two collections staged.

In the class for six decorative Show varieties

In the class for six decorative Show varieties not in commerce the first prize fell to Messrs. J. and J. Hayes, who staged the following good varieties: Madame Favart, neat truss; flower fringed pink; dark blotch on upper petals. Princess of Wales, white streaked with lake. Maid of Keut, white; pale pink spots on upper petals. Black Prince, dark maroon edged with white. Harlequin, scarlet; dark upper petals. Lady Isabel, pale purplish pink; upper petals marked with dark blotch. This was the only collection, and the plants were very good though of medium size. In the corresponding class for Fancy varieties Mr. Charles Turner, the only exhibitor, was awarded the chief prize. The varieties were all pink or pink shaded. Murio, Jannette, Polar Star, Mrs. Milne, Home, Sarah Bernhardt, and Touchstone very neat and pretty.

must have involved much 1 bour in bringing to a successful, instance.

THE FELALGONICM SOCIETY'S SHOW.

THESE were not quite so numerous nor so fine as might have been desired, and several classes were unrepresented, particularly those for Ivy-leaved varieties; but some compensation could be derived from the fact that Zonals were staged in good condition and in superior varieties. Fancy and Show varieties were also that in several collections, and cut blooms were extremely street, although but few boxes were staged.

There were five entries in the class for six Show varieties in pots not exceeding 8 inches in dameter. Mr. James, gardener to J. Simpson, Eaq., Wray Park, Reigate, was first with good plants—large trusses, and very bright in colour. Wonderful, Lucie Lemoine, C. H. Wagner, and Victor Hugo were excellent in all respects. Mr. John Cathin was second with fair specimens, followed by Mr. Meadmore.

Only one exhibitor appeared in the class for six Zonals not in commerce. Dr. Denny was awarded the first prize for the follow-ing varieties. Allegre, a good pink, large flowers; Bomeo, scarlet, somewhat loose truss but very fine flowers—in fact, all of the varieties were remarkably good. The same noted raiser and patron of the Pelargonium staged the only collection in the all of the varieties were remarkably good. The same noted raiser and patron of the Pelargonium staged the only collection in the corresponding class for four double Zonals. The varieties here were also very good: Stability, fine scarlet, large truss; Pioneer, rather lighter in colour, but otherwise similar to the preceding, as was also Gorgeous, Refinement, aptly named, white tinged with pink. The first prize was awarded. In the class for twelve Zonals in 6-inch pots Mr. John Catlin led the van with well-flowered plants of Cymbeline, G Rawlings, Orlande, and Maggie Barrett among many others. Mr. Wiggins was second with small plants, and Mr. Moorman, gardener to the Misses Christy, Coombe Bank, Kingston-on-Thames, third. Mr. J. Wiggins secured the first prize with the only plant staged in the class for one Zonal Pelargonium not in commerce. The variety was Rosa Sillen, a well-formed flower, good scarlet, rather loose truss, but compact habit.

Fig. 3.-Aotus villosa (see page 22).

CUT FLOWERS.—For twelve double Zonals, three trueses of each, Mr Thos. Taylor, gardener to J. McIntosh, Esq. (the President of the Society), Duneevan, Oatlands Park, Weybridge (the only exhibitor), was awarded the first prize for good and fresh blooms of Guillon Mangilli, Madame Thibaut, Le Nord-Est, Victor Hugo, Latayette, L'Année Terrible, Madame Amelie Baltet, Noemie, C. H. Wagner, and J. C. Roddard. The same exhibitor also obtained a similar award in the class for twelve Zonal varieties. The most noticeable were Brutus, Jealousy, Mrs. Newdegate (fine), Evening Star, Mrs. Pearson, and Charles Smith, all in good form. For twenty-four Show varieties Mr. Charles Turner was placed first with large and well-coloured flowers. The principal varieties were Emily, Prince Rupert, Crusader, Invincible, Sylvia, Dauntless, Amethyst, Champion, Despot, Negress, Lord of the Isles, and Illuminator—a fine collection. Mr. Meadmore's flowers were also fine, and merited the second prize which was awarded for them. For twenty-four Zonal varieties Mr. H. Cannell, Swanley, Kent, was first with extremely fine flowers. The varieties Marmion, Livingstone, Lizzie Brooks, Mrs. Wright, and Mrs. Clifton were excellent. Mr. Cannell was also first with twenty-four double Zonals; the flowers were very good Roi des Violets, E. Chrietien, and Cremieux were the best. Mr. Meadmore followed very closely in both classes. In the class for eighteen (Show type) decorative Pelargoniums
Mesars. J. & J. Hayes, Edmonton, were first with even and wellflowered plants, of which the best were Duchesse de Morny,
Duchess of Edinburgh, Integrity, Bridai Bouquet, and Maid of
Kent. Mr. J. Wiggins, gardener to Henry Lattle, Esq., Hillingdon Place, Uxbridge, was second with much smaller plants, but
the flowers were fine, particularly those of Startler, Muss Bradshaw, and Triomphe de St. Mande. Mr. Meadmore, The Nurseries,
Romford, was third with vigorous but poorly flowered plants.

For eighteen Zonal varieties, arranged effectively, Mr. C. Bureley, The Nursery, Brentwood, was placed first with vigorous and
well-coloured plants. Miss Watson, Mars, and MacMahon were
noticeable. Mr. Meadmore was placed first with vigorous and
well-coloured plants. Miss Watson, Mars, and MacMahon were
noticeable. Mr. Meadmore was second with an even and wellflowers were very good Roi des Violets, E. Chrietien,
and Cremieux were the best. Mr. Meadmore followed very closely
in both classes.

MiscRllanged, Mrs. Callin, Titania, Lucy Bosworth, Ellen, and Mrs. Pearsen, Mr. Meadmore was placed third,
To Mr. Wills, Onslow Crescent, for a handsome arrangement of

foliage plants relieved by few Orchids and fine Gloxinias; and to | Mr. B. S. Williams for a splendid group of stove and greenhouse plants. Silver Banksian medals were secured by the following exhibitors:—Messrs. Cutbush & Sons, Highgate, for a group of greenhouse and foliage plants, in which a fine plant of Phænocoma prolifera Barnesii was noticeable; Messrs. Hawkins and Bennett, Twickenham, for groups of Pelargoniums Vesta, Madame Vaucher expressed with Adjant Managery Parks Bennett, Twickenham, for groups of Pelargoniums Vesta, Madame Thibaut, and Madame Vaucher, arranged with Adiantum cuneatum; Messrs. Oborn & Son, Fulham, for a group of Ferns and Palms; Messrs. Hooper & Co. for a collection of succulent and foliage plants; Mr. Robert Parker, Tooting, for a fine group of hardy plants and cut Pæony blooms; Mr. Boller, Kensal New Town, for a collection of Cacti; Mr. Hooper, the Vine Nursery, Bath, for a collection of cut flowers of Pansies, Pinks, Pæonies, and Ranunculuses; Messrs. A. Smith & Son for a group of Pelargoniums and foliage plants. Messrs. T. Rivers & Son, Sawbridgeworth, were awarded a silver Knightian medal for a fine group of fruit trees. Messrs. Barr & Sugden secured a silver-gilt Flora medal for an extensive collection of hardy plants, and cut blooms of medal for an extensive collection of hardy plants, and cut blooms of Irises and Liliums. Mr. James Marcham, Isleworth, was awarded a bronze Banksian medal for a collection of very fine singlediscrete Petunias. The fountain and rockery arranged by Messrs. Dick Rado: yffe & Co., Holborn, was highly commended; and the bouquets from Messrs. Smith & Larke, Florists, Kensington, were also commended. Many plants were sent from the Society's gardens at Chievick, also a large collection of Lettuces. dens at Chiswick; also a large collection of Lettuces.

A beautiful box of cut flowers of Liliums from the collection of James McIntosh, Esq., Duneevan, comprising longiflorum, Humboldtii, fine; Krameri, excellent; testaceum, creamy, massive; pardalinum, Robinsonii, very attractive; philadelphicum, matagon album, dalmaticum, and some varieties of umbellatum, were much admired.

SPECIAL PRIZES.

The prizes offered by Messrs. John Laing & Co. for nine Tuberous Begonias were secured by Mr. J. Tong, The Gardens, South Lodge, Southgate; and Mr. Luff, gardener to R. K. Hyatt, Esq., Mount Ephraim Road, Streatham, in the order named. Mr. Tong's plants were remarkably well grown, some being trained rather flatly but not formal, and were 2 to 3 feet in diameter others being more upright. 2 feet high and through a number of the second secon diameter, others being more upright, 2 feet high and through, and all fine in foliage and flowers. The varieties were Hecla, President, Kallista, The Shah, Acme, Stromboli, Comte de Hemptinne, Emperor, and Professor Barvenich. Mr. Luff's plants were some-

what drawn.

Vegetables.—These were well exhibited for the prizes offered by Messrs. James Carter & Co., Sutton & Co. (postponed from the summer show), and Hooper & Co. The competition was good in the class for thirteen dishes, prizes of £7, £5, and £3 being offered by Messrs. Carter. Mr. G. T. Miles, gardener to Lord Carington, Wycombe Abbey, secured the first position with a very fine collection, consisting of Stamfordian Tomatoes, splendid; Nantes Horn Carrots, fine; Seville Longpod Beans, Unique and William I. Peas, White Naples Onions, Telegraph and Tender-and-True Cucumbers, Early London Cauliflowers, Improved Lapstone Potatoes, Wycombe Abbey Brown Cos Lettuce, Canadian Wonder Beans, and Early Snowball Turnips. Mr. Iggulden, gardener to R. B. Wingfield Baker, Esq., Orsett Hall, Romford, was placed second with a generally good collection; Mr. R. Phillips, gardener to Captain Jackson, Meopham, third; and Mr. T. Haines, gardener to the Rt. Hon. Earl of Radnor, Coleshill House, Highworth, fourth. An extra prize was given by the Messrs. Carter to Mr. H. Marriott, Skirbeck, Boston, who was disqualified on account of staging a deficient dish of Tomatoes.

Mr. W. Iggulden was the only competitor for the prizes offered by the Messrs, Hooper & Co., Covent Garden, for a collection of twelve dishes, to include Hooper's Round White and Covent Garden Perfection Potatoes, Market Favourite Peas, Hooper's Favourite Onions, Covent Garden Mammoth Cauliflowers, Acme Tomatoes, and Hooper's Nonsuch Turnips. In addition to these Mr. Iggulden staged Paragon Cucumbers, Early Horn Carrots, White Advancer Beans, Heartwell Marrow Cabbage, and Globe Artichokes, the latter being very fine. The whole collection was VEGETABLES.—These were well exhibited for the prizes offered

White Advancer Beans, Heartwell Marrow Cabbage, and Globe Artichokes, the latter being very fine. The whole collection was very creditable and secured the £5 prize, but the date was too very feetined and section the LS pite, but the date was too early for some of the vegetables stipulated. One grower only, Mr. Marriott, competed for the special prizes offered by the Messrs. Carter for one dish each of Culverwell's Telegraph, Carter's Telephone, Carter's Little Wonder, and Carter's Challenger Peas. The pode were very fine but far from being well filled. The first prize was awarded.

Mt. 13 much was the only competitor for the special prizes offered by the Messrs. Sutton and Sons for six varieties of Peas offered by the Mess'rs. Sutton and Sons for six varieties of Peas and was awarded the first prize, a silver medal and £2, for good dishes of Sutton's Ringleader, Caractacus, William I., Harbinger, The Shah, and Unique. Great complaints were to be heard on all sides of the difficulties experienced in the kitchen garden, especially with regard to the Pea crop.

Near the vegetables Mr. Miller, Clumber, staged a very fine Melon named William Tillery, which was recently awarded a first-class certificate by the Fruit Committee. Mr. Goodacre, Elvaston

Castle, Derby, staged two very highly coloured dishes of Early Grosse Mignonne Peaches and Lord Napier Nectarines.

FRUIT COMMITTEE.—Henry Webb, Esq., V.P., in the chair. Mr. Wildsmith, gardener to Lord Eversley, Heckfield, exhibited thirteen Melons, the produce of three plants grown in a root space 5 feet long by 18 inches wide and the same in depth. They space 5 feet long by 18 inches wide and the same in depth. They were of medium size, and appeared to be well ripened. The variety was Earl of Beaconsfield, and a cultural commendation was awarded. Mr. B. Morrell, The Cedars, Richmond, sent a seedling Melon (Morrell's Scarlet), which was over-ripe and mealy, but in a favourable season would probably possess fair flavour. Mr. Bailey, Shardeloes, and Mr. W. Irwin, gardener to Lord Howard, Glossop Hall, also sent seedling Melons; that from the former was passed, and the one from the latter was found to eunripe. Mr. Stevens, gardener to A. Bouverie, Esq., Delapré Abbey, and Mr. J. Martin, Manor Farm, North Cray, exhibited seedling Melons. Mr. Gibert of Burghley sent two fruits of Netted Victory Melon. this time netted naturally. One was green-fleshed victory Melon, this time netted naturally. One was green-fleshed with a dark green rind, and the other yellowish with a yellow rind, which raises the question as to which is the true Netted Victory. He also sent a Melon of good flavour, selected from Lord Beaconsfield. A letter of thanks was accorded. Mr. Parkins, gardener to C. Keyser, Esq., Stanmore, exhibited a large Providence Pine Apple weighing 10 lbs., the produce of a rootless sucker planted August 12th, 1878. A cultural commendation was awarded. Mr. Jarvis, gardener to J. Edwards, Esq., Blackheath, exhibited a dish of Peaches, and was accorded a vote of thanks. exhibited a dish of Peaches, and was accorded a vote of thanks. Mr. Goodacre. The Gardens, Elvaston Castle, and Mr. Coomber, gardener to Col. Wilkinson, received a similar mark of recognition; the former for six dishes of seedling Potatoes, the variety to be tried at Chiswick, and one dish of Northern Greening Apple; the latter for a twin Cucumber (Telegraph). Mr. John Spaven, Ulverston, sent some fine Rôyal George Peaches and Eiruge Nectarines. Mr. Dean sent some Peas as grown singly in 7-inch pots; the haulm was well covered with good pods. The varieties were Robert Fenn and Dean's Dwarf Marrow, and they were to be tried at Chiswick, as they appeared adapted for forcing.

FLORAL COMMITTEE.—Dr. Denny in the chair. A number of plants were exhibited for certificates, principally from Messrs. Veitch & Sons, Chelsea, Messrs. John Laing & Co., Forest Hill, and Messrs. J. & J. Hayes, Edmonton. The following first-class certificates were awarded: To Messrs. Veitch & Sons for a beautiful tificates were awarded: To Messrs. Veitch & Sons for a beautiful Tuberous Begonia Constance Veitch; flowers neatly formed, very dark scarlet, compact. Several other handsome Begonias were also exhibited by this firm. Rhododendron Duchess of Teck wascertificated (first-class). The flowers are pale cinnamon coloured, rather small, but finely formed. To Messrs. J. Laing & Co. for the Tuberous Begonias Mrs. Howe, flower large, pale orange, vigorous habit; and Reine Blanche, flower of medium size, pure white, beautiful. To Messrs. J. & J. Hayes for a decorative Pelargonium (Show type), Princess of Wales, large flowers, crumpled petals-streaked with lake, white throat. To Mr. King, gardener to J. Simpson, Esq., Wray Park, Reigate, for Coleus Mande, leaves streaked with red, yellow, and green. To Mr. H. Cannell, Swanley, Kent, for a Tuberous Begonia Edouard Morren, a double scarlet flower of extraordinary size. To Mr. C. Edmonds, Hayes and Hillingden Nurseries, Middlesex, for a Tricolor Pelargonium Henry Cox, an extremely good variety, compact habit, neatfoliage, and rich dark colour. To Mr. Frederick Perkins, nurseryman, Leamington, for a Show Pelargonium as a decorative plant, named Volunté National; flower neat but small, white blotched with pink in the centre of the petals. To Messrs. Paul & Son, Cheshunt, for the Rose Duke of Teck, which is described in our report of Alexandra Palace Rose Show. A vote of thanks was accorded to Mr. H. Heims for Cypripedium niveum giganteum and Dendrochilum filiforme, also to Messrs. Barr for Pyrethrum. Tuberous Begonia Constance Veitch; flowers neatly formed, very

CHRYSANTHEMUMS.

THE present season so far has been a very favourable onefor Chrysanthemums. Autumn-struck plants which received their final potting three or four weeks ago are now established and are growing strongly, being specially encouraged by the damp weather. Spring-struck plants are now being potted; they are a little more pot-bound than they ought to be, but owing to other pressing work we could not find an opportunity for earlier attention to them. Aphides have made their appearance on the points of the shoots, and our mode of destroying them is by mixing tobacco water and clean water in equal parts, and letting it drop from a piece of spenge into the centre of each point, two doses generally prove sufficient. We find the best time to apply this antidote is in bright sun-shine, as it is then more effectual than if put on in the morning or evening.

As soon as the shoots are long enough they should be staked individually. This we find gives the wood a better chance of ripening than tying them all to one central stake. We retain from four to six main shoots. The variety Eve when intended to bear large blooms should receive a June pinching. This causes it to produce a finer shoulder or crown bud with a longer period for development. Growers will soon be looking forward to the several extra contests which are to take place this year, particularly at Kingston and Birmingham.—HUGH ELLIOTT.

CHOICE ZONAL PELARGONIUMS.

No plants are more deserving of the appellation "all the year round plants" than are these, and no one has done so much to establish that position for them as Mr. Cannell. During every month of the year he has exhibited magnificent stands of cut blooms at South Kensington, and it is impossible to visit Swanley at any time without seeing a display of these deservedly popular plants that may justly be described as startling. On entering one of the hundred-feet-long structures (of which several are devoted to the different types of Pelargoniums), the visitor naturally commences to "pick out" the best varieties. This, where all are so good, is no easy task, but the following in the single Zonal house are a few of the best of the newer varieties that are not yet so familiar to the public as they no doubt will be. At any rate their merits entitle

them to be grown everywhere. One of the first to attract by its luminous brightness is Guines (Parker). This by its decided glow of yellow puts Jealousy and all others of its hue quite out of court. H. M. Pollett, also raised by Mr. Parker, commands attention by its rich glowing crimson colour and clear white eye. Lord Giffard, one of Mr. George's finest productions, is a grand variety, combining high quality of flower with richness of colour, scarlet suffused with crimson, in a remarkable manner. George's General Grant, rich crimson, is a variety of great excellence. Dr. Denny (Sisley), is yet the richest of all in its decided purplish tint and orange markings. In fine contrast is Pearson's Sophie tint and orange markings. In fine contrast is Pearson's Sophie Birkin, a splendid salmon, in colour charming, in shape about faultless. Some other varieties by the same renowned raiser also command attention, notably Lady Bayley, rich magenta pink, beautiful, and highly distinct. Henry Jacoby (semi-Nosegay), intense deep crimson. Mrs. Ward, purplish pink, dwarf, fine truss, striking. Lizard, rosy salmon, scarlet centre, fine. H. H. Crichton, glowing crimson, white eye, free; and Aphrodite, rosy cerise, top petals scarlet, large truss. Amongst Dr. Denny's varieties (which are notable for their substance of petal and excellence of form), the following substance of petal and excellence of form), the following demand notice:—Titania, rich crimson, white eye; Zuleika, purplish magenta, distinct; Madonna, rosy salmon; Sunbeam, intense scarlet; Gnome, brilliant orange scarlet; all of which are of decided merit. Amongst somewhat older varieties the following are distinct and fine:—Heather Bell, Lady Eva Campbell, Mrs. Wright, Mrs. Pearson, Burns, Mrs. Davidson, and Lady Sheffield. The best single white variety is Jeanne d'Arc; all the varieties of Vesuvius being indispensable for winter decoration and bedding.

A few of the finest doubles—the plants being dwarf and flowers fine—are, amongst Scarlets, F. V. Raspail, Louis Barthière, and Gambetta. Rose and Pink—Emile de Girardin, and Madame R. Guerrin (Crou s.). Purplish Pink—Le Main (Gerbeau), Littre, and Duparte Viox (Rœmpler). Salmon—Victor Hugo, Casimir Perrier, and La Constitution. Whites—Candidissima plena, very fine (Boutard), Madame Thiers, and Madame Baltet; La Nymphe, a fine variety certificated last year, I did not see in bloom at Swanley. All the varieties not otherwise mentioned were raised by M. Lemoine, and it only remains to be said that they are worthy of him and of Swanley, and therefore of all cultivators of this pre-eminently useful class of plants.—VISITOR.

BRENTWOOD HORTICULTURAL SOCIETY.

THE weather has hitherto been singularly favourable on the occasions of this Society's Summer Show, but that held in the pleasantly situated grounds of F. Willmott, Esq., Warley Place, on July 1st, was a very unfortunate exception to the rule. The display was a very good one and the arrangements excellent; both, however, were completely marred by the very stormy weather experienced. The various classes for plants were well filled, and some of the specimens were very good indeed. The premier prize, a silver cup for twelve stove or greenhouse plants, was easily won by Mr. Miller, gardener to A. Canning, Esq., Halstead. This collection included large specimens of Pandanus utilis. Latania

borbonica, Crotons variegatum and elegantissimum. Erica Candolleana, &c. Mr. Bones, gardener to D. McIntosh, Esq., Havering Park, Romford, was placed second in this class, first for flowering, and also foliage plants, Pelargoniums, &c. Other successful exhibitors were Messrs. Wise, gardener to W. A. Ogg, Esq.; North, gardener to A. Willmott, Esq.; Bradley, Bishop, Fold, Meadmore, &c. The latter staged six unusually well-grown specimen of double-flowering Pelargoniums, the varieties being Guillaume Mangilli, Lucie Lemoine, Fille d'Honneur, Asa Gray, Madame Thibaut, and Pyrites. Table plants were largely and well shown; the first-prize group included plants of the extremely graceful green-foliage plant Casuarina sumatrana.

The tent devoted to cut flowers and fruit was very attractive,

The tent devoted to cut flowers and fruit was very attractive, the display for the year being very good. Mr. Cant. Colchester, was very deservedly awarded the first prize for forty-eight cut Roses. His best blooms were Devoniensis, Hippolyte Jamain, Mons. Noman, Princess Mary of Cambridge, Comtesse de Paris, Prince Arthur, Mons. Etienne Levet, Maréchal Niel, Ville de Lyon, Capt. Christy, and Général Jacqueminot. In the amateurs' class for twenty-four Roses Mr. Edwards, gardener to the Rev. Canon Tarver, was placed first, he being closely followed by Mr. W. Harrington, gardener to E. Mitchell, Esq., Romford. The best blooms in the former's stand were Countess of Oxford, Charles Lefebvre, Duke of Edinburgh. Dupuy-Jamin, and Général Jacqueminot; and in that of the latter Auguste Rigotard, Duchesse de Morny, Maurice Bernardin, Jean Pernet, and Camille Bernardin were very good. Mr. Edwards also secured the first prize for a stand of twelve blooms of any one variety with fair examples of Souvenir d'un Ami. An excellent stand of Gloire de Dijon was unaccountably passed in this class, the prizes going to less fresh and less even stands. Some of the exhibits were very fair in the smaller classes; the best single bloom, a fine specimen of Général Jacqueminot, was staged by Mr. Cant.

The best collection of four varieties of fruit was staged by Mr.

The best collection of four varieties of fruit was staged by Mr. Bones. The Violette Hâtive Peaches both in this class and also in that for Peaches were very fine indeed. Mr. Farrance, Chadwell Heath, staged the best Black Hamburgh Grapes, and very little inferior were those which gained Mr. Simpson the second prize. White Grapes were poor, and no prize was awarded for a Melon. Strawberries were staged in fair quantities, the dish of Sir Charles Navier achilited by Mr. Express being were fine.

interior were those which gained Mr. Simpson the second prize. White Grapes were poor, and no prize was awarded for a Melon. Strawberries were staged in fair quantities, the dish of Sir Charles Napier exhibited by Mr. Farrance being very fine.

Vegetables were fairly well shown both by the gardeners and cottagers. Among the former Mr. W. Iggulden, Orsett Hall, Romford, was the most successful; his collection of eight varieties being good, notably the Tomatoes, Onions, Carrots, and Caulifowers.

NOTES AND GLEANINGS.

In consequence of the almost continuous rains that have lately prevailed BEDDING-OUT IN THE LONDON PARKS has been much interrupted, and the work is not yet finished. Much damage has been done to the plants that were planted early in June, Alternantheras and such like plants being much battered by drenching rain and greatly cut by hail. The hailstones have also considerably injured the fronds of Palms and finefoliaged plants, giving them a spotted appearance from which they will not soon recover.

— WE have received from Mr. George Lee, Clevedon, some leaves of POTATOES and Moss ROSE BUDS with the accompanying note—"The blotches on the Potato leaves first appeared nearly a month since, but the decay is now spreading rapidly, and if this weather continues it will, I fear, be most serious. The first appearance of the discolouration was confined to some 3 or 4 yards, but it has now made its progress to others quarters, and I hear that others are suffering greatly, too, here and in the neighbourhood. The enclosed Moss Rose buds will show you how much we have suffered from the wet; the mossy part, not dry for several days, eventually gives way and rots as you see."—[The leaves and buds are truly in a sad state—almost entirely rotten, and afford conclusive evidence of the extreme inclemency of the season.]

— A CORRESPONDENT communicates the following in reply to "W. L." on CLEARING MEALY BUG FROM GRAPES:—
"I find the best way to clean bunches of Grapes from mealy bug is with methylated spirit and a moderate-sized camelhair paint brush. Dip the brush in the spirit and just touch either bug or eggs; it is done at once, as the spirit quickly runs all over them. I used it for the Vine; as well. I do not find any injury from the spirit except in tender plants and very young growths; but the Vines and bunches must be looked over constantly, as it is impossible to get rid of the pests at once."

some of the specimens were very good indeed. The premier prize, a silver cup for twelve stove or greenhouse plants, was easily won by Mr. Miller, gardener to A. Canning, Esq., Halstead. This great interest the paper on IRISES on page 471. We have collection included large specimens of Pandanus utilis, Latania | grown Irises here in a small way during the last three years,

mixed varieties—the Spanish and German Irises, and nothing can be more lovely than the "high art" colouring in all the flowers. The most beautiful shades of olive green, golden brown, pale yellow, pale violet, and a rich bronze or copper colour, they are quite like Orchids in their uncommon and weird arrangements of colour. The season is so late this year that the Irises are only just coming into bloom."

— WE are requested to state that the prize offered at the NATIONAL ROSE SOCIETY'S SHOW at the Crystal Palace by G. P. Hawtrey, Esq., for three trusses of any new seedling Rose not in commerce, and for which there were no entries, may be competed for at the Society's Provincial Show at Manchester on the 19th.

— FOR some weeks past the RHODODENDRONS exhibited by Mr. Anthony Waterer of Knaphill, Surrey, at the Royal Botanic Society's Garden, Regent's Park, have been extremely beautiful and many still retain their flowers, although the majority are past their prime.

— WE have received from the Rev. F. Tymons a spike of a very beautiful DELPHINIUM. The flowers are rich dark blue in colour, and as they are borne on wire-like pedicels 5 inches in length, are useful for bouquets, &c. The main stem is very strong, and the whole plant must have a rich and stately appearance. It resembles a variety which we have seen in Belgian nurseries and a few English gardens under the name of atro-purpureum, and is unquestionably a very fine border plant.

— A CORRESPONDENT sends us the following note on the BROCKHAM ROSE SHOW:—"Like the rest, this Society had altered its show day. It was changed from June 26th to July 4th. Even this date proved at least a week too early. After being driven by the elements from Mickleham Park, the Association wisely took refuge in the Dorking Public Hall. The room, a magnificent one, was decorated with banners, and at one end with a grand mass of various flowers furnished by Mr. Appleby of Box Hill Nurseries. Considering the season the Show was exceptionally good, and received the warm commendation of the Judges (the Rev. A. B. Alexander and Mr. George Paul of Cheshunt) as the best local Show of the year so far. The first prizes for twenty-four, twelve, and six of any kind were taken by Lady Lawrence, F. T. Wollaston, Esq., and G. C. Stone, Esq.; the first for twelve Teas by the Rev. A. Cheales, and for six Teas by F. T. Wollaston, Esq.; also prizes for table decorations by Miss Fuller. The National Society's silver medal was won by a Duke of Edinburgh, H.P. (Rev. A. Cheales); and the Society's bronze medal by a Maréchal Niel (H. Stilwell, Esq.)."

—— AMIDST the complaints of the lateness of the STRAW-BERRY SEASON and the scarcity of fruit in the markets we are informed on good authority that one grower in Essex a fortnight ago sent three tons of fruit to market, and realised a very high price for them. The variety is Alice Maud, that was once more popular in gardens than it is now. It is an early, hardy, and productive variety.

— THAT beautiful Orchid THUNIA BENSONIÆ is now flowering in the Orchid house of the Royal Botanic Garden, Regent's Park. It is bearing two short racemes of four flowers each, and the latter, which are slightly pendulous, appear nearly level, owing to the short internodes. The scpals and petals are an extremely delicate pale purple, the labellum being much darker in hue. The plant is a native of the mountains of Moulmein, and requires the temperature of an East Indian house and abundant supplies of water during growth. In the same house Oncidium cornigerum was noticeable for its fine spike of yellow flowers. In the Water Lily house the Victoria Regia appears vigorous and healthy, with the exception of a few spots on the older leaves, but there is at present no signs of flowers. Trained to the roof is Allamanda nobilis, which now has several fine flowers of excellent colour and form.

—— BARON DE HUBNER visited Kiyoto in Japan, and says that there JAPANESE GARDENING is in the greatest perfection, and reaches the utmost limits of the grotesque. A colossal Pine is turned into a boat; the trunk being the mast, the upper branches forming the yards, and the lower branches the oars.

— We recently noticed in the PINE APPLE NURSERIES, Maida Vale, some young plants of Odontoglossum vexillarium, especially noticeable for their extremely fine flowers. Several Stanhopeas were in good form, particularly S. saccata and S. insignis, the peculiar flowers of which are very striking.

We noticed a batch of remarkably vigorous Thunias which will shortly be in full beauty; most of the species are grown, but the majority is of T. Bensonise. Three plants of Lilium giganteum were very fine with enormous flowers. The pure white form of Agapanthus umbellatus was also flowering freely, and very distinct it is. Hæmanthus Kalbreyeri was very brilliant, and small plants were flowering abundantly. Among many other noteworthy plants we observed Masdevallia Harryana purpures, flower good and colour distinct; also the beautiful M. atro-sanguines. Sonerilas and Anæctochiluses were as usual in excellent condition, and the large quantities of Fuchsias and miscellaneous softwooded plants here grown ndicate a careful and efficient system of cultivation.

EFFECTS OF THE WINTER IN WALES.

It may interest your readers to be informed of the effects of the late winter in this mild climate. We are upon the west side of Merionethshire, about three miles from the sea.

A plant of Mandevilla suaveolens, on the south-west side of the house, which had attained a height of 24 feet, is, I fear, quite killed. Till this year it had never been protected. Upon raising the bark it is green, but shows no symptoms of growing. All the Eucalypti are irrecoverably lost. One in two years

All the Eucalypti are irrecoverably lost. One in two years had attained a height of 14 feet. A very large plant of Passion-flower is destroyed; but at the bailiff's house, about half a mile off, and at a cottage in the village, they are recovering.

All the plants of Lobelia fulgens are gone, and a very pretty trailing Convolvulus; we called it Convolvulus argenteus, but I suspect that it is not the right name. It had been here for nineteen years. The plants of Calycanthus floridus, which have been here for many years, are all destroyed. All the Veronicas are gone.

The Camellias out of doors are little or none the worse, and the double ones out of doors this spring flowered luxuriantly. One of the Myrtles looks very bad, but a very large one is little injured. The Hydrangeas have not suffered, and promise

to flower well.

At Wynnstay in Denbighshire, the seat of Sir W. Williams Wynn, Bt., more rain fell in the last month than in any June but one since 1868 inclusive. The rainfall last month was 5.29; the nearest approach to it—but in 1872, when it reached 5.73—was in 1871 and 1875, when it amounted to 3.21 and 3.73. Last month at Wynnstay it rained upon twenty-six days; at Nannan Park Gardens in this county the fall was 7.60 in June; here it was 5.51. A plant of Lapageria rosea is none the worse. The show of wall fruit is very good.—W. W. E. WYNN, Peniarth.

CANTERBURY ROSE SHOW .-- JULY 3RD.

HURRAH for the old city! I thought when I saw the spirit which pervaded that meeting at the "Rose" some months ago and by whom the cause of the young Society was taken up, and that two such Secretanes as Mr. Biron and Mr. Mount were ready to give it the benefit of their services, that something would come of it, although horticulture seemed at so low an ebb and existing societies so feeble. But I was not prepared for such a summer or such a season, and I am sure that my excellent friend Captain Lambert, who was Chairman, was nearly as well pleased as when he sees his favourite candidate at the head of the poll; and that Mr. Biron hardly knew which made him more happy, the success of the Exhibition generally or his own prowess, by which he carried off three first prizes and both of the medals of the National Rose Society, while Mr. Mount must have indeed been gratified at the large and fashionable attendance and the good balance he would have in hand for the coming year.

Let me say that the Exhibition was held in the very best room

Let me say that the Exhibition was held in the very best room for the purpose I have ever seen—the Corn Exchange, long, narrow, and lofty, and lighted by skylights which were softened by canvas stretched across them. Nothing could have been better. There was abundance of room for promenading, and the end was filled with a table containing the vases entered for competition and a very handsome collection of silver and gilt flower vases exhibited by Mr. Mason, the well-known silversmith of High Street, whose taste is celebrated throughout the county; and at the other end were some pretty cachepots, the manufacture of Mr. Philipt, which are I think likely to be much appreciated

Street, whose taste is celebrated throughout the county; and at the other end were some pretty cachepots, the manufacture of Mr. Philpot, which are, I think, likely to be much appreciated. Tea Roses were shown in splendid condition. In the open class for twelve the first prize was carried off by Mr. Mitchell of Piltdown with Madame Willermoz, Maréchal Niel, Souvenir d'Elise, Marie Van Houtte, Comte de Paris, Madame Margottin, Devoniensis, Duc de Magenta, Adam, Josephine Malton, Jean Pernet, and Souvenir d'un Ami. Mr. Cant was second wt ha box of almost equal merit, containing Rubens, Devoniensis, M: dame Willermoz,

Souvenir d'Elise, Moiré, Céline Forestier, Madame Riza du Parc, a most lovely new Rose; Caroline Kuster, Maréchal Niel, Souvenir d'un Ami, Madame Bravy, and Marie Van Houtte. Mesars. Kinmont & Kidd were first in the open class for thurty-six distinct russes. Amongst the blooms were fine examples of Elie Morel, Madame Emma All, Marie Baumann, Madame Lacharme, Duke of Edinburgh, Duchess of Vallombrosa, Fisher Holmes, Marquise de Mortemart, Mons. Fillion, Prince Camille de Rohan, Etienne

Levet, La France, Felix Genero, Belle Lyonnaise, Sénateur Vaisse, Baronne de Rothschild, Annie Laxton, Marguerite de St. Amand, Maréchal Niel, Antoine Ducher, Gabriel Tournier, and Paul Neyron. Mr. Biron's box, which was awarded also the National Rose Society's medal as the best box in the Show, was really grand, It contained Ferdinand de Lesseps, La France, Duke of Edinburgh. Abel Grand, Marie Baumann (this was awarded the bronze medal of the National Rose Society as the best Rose in the Show).

Madame Victor Verdier, Madame Marie Finger, La Rosiere, Charles Lefebvre, Capitaine Christy, Lord Macaulay, and Madame Prosper Langier. Mr. Biron also took first prize for a splendid box of six of one sort, Souvenir d'un Ami, large and fine. Mr. Wakeley of Rainham, Mr. Hollingworth of Maidstone, Mr. Peckham, Captain Kuight, and other exhibitors also contributed some fine blooms. I subjoin a list of awards. I subjoin a list of awarde.

Any kinds, eighteen varieties, one truss each.—First, Mr. J. Wakeley, Rainbam; second, Mr. W. Mount, Canterbury; third, Mr. Edward Neame. Twelve varieties, one truss each.—First, Rev. H. B. Biron, Harbledown; second, Mr. W. Wakeley, Rainbam; third, Mr. T. G. Peckham, Hall Place, Harbledown. Six

varieties, one truss each.—First, Mr. J. Verrier, Bridge; second, Mr. George Mount, Harbledown; 3rd, Mr. G. P. Collard, Canterbury.

Tea-scented and Noisettes, twelve varieties, one truss of each.—First, Mr. R. W. Knight, Bobbing; second, Rev. H. B. Biron, Harbledown; third, Capt. W. W. Knight, Wye. Six varieties, one truss of each, Mr. T. G. Peckham

Any kinds, twelve varieties, three trusses of each.—First, Mr. W Wakeley; second, Mrs. Warton, Herne Hill. Six varieties, three trusses of each.—First, Rev H. B. Biron; second, Mr. Thos. Sargeant, Bridge; third, Capt. Lambert, Canterbury.

Six trusses of any Rose.—First, Rev. H. B. Biron; second, Mr. H. B. Peckham, Patrixbourne; third, Mr. George Mount.

H. B. Peckham, Patrixbourne; third, Mr. George Mount.

The National Rose Society's silver medal for the best box of Roses in any of the above classes, and the same Society's bronze medal for the best Rose in the Show, to Mr. H. B. Biron.

One vase or epergne consisting of Roses combined with Ferns or other foliage.—First, Mrs. H. B. Biron; second, Mrs. Bunyard, Ashford; third, Mrs. Warton; fourth, Miss Kinmont, Canterbury.

One hytton-hele boyungt consisting of one or more Rose hads

Ashford; third, Mrs. Warton; fourth, Miss Kimmont, Canterbury.

One button-hole bouquet, consisting of one or more Rose buds combined with other flowers or foliage.—First, Miss Welby, Canterbury; second, Miss Peckham, Harbledown; third, Miss Kinmont.

For nurserymen.—First, Kinmont & Kidd, Canterbury; second, Mitchell & Son, Uckfield, Sussex; third, Mr. G. W. Piper.

Twelve Teas and Noisettes.—First, Mitchell & Son, Uckfield; second, Mr. B. R. Cant, Colchester; third, Mr. T. Hollingworth, Maidenne.

Maidstone. The vases or epergnes of Roses and foliage were very good, especially those of Mrs. Biron, which gained the first prize, and Mrs. Bunyard's, to which the second was awarded. All lovers of the Rose will, I am sure, rejoice at the success of this latest addition to the number of Rose Societies.—D., Deal.

MESSRS. CARTER & CO.'S ANNUALS AT REGENT'S PARK.

THE corridor leading from the large conservatory in the Royal Botanic Society's Garden is at present bright with the extensive collection of annuals exhibited by this enterprising firm, and no visitor to the Garden should fail to see these attractive little plants. They are arranged on a low staging sloping up to the wall, not in formal straight lines, but in a succession of semicircles, which adds considerably to the pleasing effect of the groups as viewed from one end. The colours also are tastefully contrasted, and almost every imaginable shade is represented. Near the wall are clusters of a tall double yellow Chrysanthemum, the brightness of which is agreeably softened by the compact heads of the mauve Schizanthus pyramidalis, variety Tom Thumb. Masses of the brilliant Nasturtiums Tom Thumb Beauty and Tom Thumb Scarlet are relieved by the blue tints of Kaulfussia amelloides and its varieties, the pale purple Collins a bicolor, the star-like pink Saponaria calabrica, and the numerous shades of Phlox Drummondii. At intervals the glaucous foliage of Melianthus major appears; and the graceful Brizas, B. maxima and B. media, assist in breaking the monotony of colour,

while an edging of the common Musk forms a pleasing finish.

Among the most noteworthy were the following:—Phlox

Drummondii Napoleon III. with flowers of medium size in
large heads and of extremely rich crimson colour; in masses

this would be were effective. Another maintains as less as the this would be very effective. Another variety was also striking—Phlox Drummondii roses, flowers bright pink with a darker eye. Veronica syriaca is pretty and diminutive; flowers bright blue and abundant. Chrysanthemum The Sultan is showy with intense crimson maroon flowers; Lord Beaconsfield is similar, but larger and brighter. The charming little Silene pendula compacta is now past its best, but it has flowered remarkably freely, and is well adapted for pot culture. There were many others which we cannot enumerate; suffice it that four or five thousand pots-are staged, and a much greater number is required to replace the plants as they go out of bloom. The exhibition will continue during a portion of the present month.

DOUBLE PYRETHRUMS.

It is a wonder everybody who has a garden does not grow Double Pyrethrums. We have dozens of clumps of them at present which are really beautiful, and also extremely useful for yielding cut flowers. Quite hardy, easy to propagate if stock is wanted, easy to cultivate—merely requiring to be planted in a thoroughly enriched soil in the first instance and afterwards let alone. If plenty of flowers are wanted in great variety as regards shades of colour—from purest white and yellow through shades of blush and rose to deepest crimson this is surely a flower that should be grown in all gardens. We have some new varieties from Messrs. Downie & Laird which appear to be good, but at present it is difficult to say much of them, as the plants, originally very small, have not gained sufficient strength this season to show the flowers at their best.—R. P. B.

WILLIAM I. PEA.-I am very anxious to inform my fellow gardeners that after this trying spring I can with confidence recommend William I. Pea as the earliest and best I know. I

sowed Emerald Gem, Sangster's, Daniel O'Rourke, and Little Gem in February as well as William I., which I gathered the first dish on June 28th. It is the earliest and has the best constitution of any. This will be of use to those who have to supply a good early Pea. This will be sufficient excuse for my troubling you.—John Chester, Gardener to J. M. Heatherts From Heathcote, Exq.

LIVERPOOL HORTICULTURAL ASSOCIATION.

WE were glad to see an announcement in the Journal of the Liverpool Horticultural Association's Show, which is to be held on August 2nd and 4th in Sefton Park. This young Society is entirely due to the energy of the gardeners in the neighbourhood, who were disappointed with the poor shows in St. George's Hall in comparison with those at Manchester, York, Leeds, and many other towns. A summer show in one of the parks was much required by gardeners and the lovers of horticulture generally, and we hope success will attend the efforts of the Committee to promote public interest in their new undertaking. The Association has the patronage and support of the Earls of Derby and Sefton, Col. J. Ireland Blackburge, M.P., and such Vice-Presidents as Sir T. Edwards Mose, Bart., Sir Thomas Earle, Bart., Sir Andrew Barclay Walker, and many other distinguished gentlemen of the neighbourhood, with Thomas B. Boyden, Esq., Mayor of Liverpool, at the head as President.

We consider the first step to the advancement of horticulture in a locality is the formation of a good horticultural exhibition, where the productions of Nature and Art can be brought from distant exhibitions and various localities to be compared with those grown in the neighbourhood. The good culture and skill needed to produce the specimens staged are carried home in the minds of the employer as well as the gardener, thus stimulating both to do likewise.

We wish to inform the readers of the Journal and exhibitors generally, that the object of the Association is to establish a show on a broad and liberal basis, and we give a pressing invitation to exhibitors to compete for the prizes offered in the schedule. Another year it is hoped that still further inducements will be provided for exhibitors in various classes.

The Association when fairly established intends holding meetings for the purpose of reading papers on various practical subjects on gardening, which can scarcely fail being advantageous to gardeners both young and old.—A LIVERPOOL GARDENER.

ROSES AT THE TUNBRIDGE WELLS SHOW.

"Heavy rain in the morning, fine in the afternoon," was a pretty correct forecast of the weather of Friday last, except that the rain of the afternoon, so far from being "fine," was exceptionally heavy, even for 1879; at least, I know my hat, which I had incautiously placed near the entrance while discussing with my fellow Judges the table decorations in the Committee tent, registered 0.33 in the same fraction of an hour.

The Show was held at the Hydropathic Sanatorium. A more charming place cannot be imagined; it would exhaust the superlatives of the most profuse auctioneer. My province, however, is to speak of the Roses. This untoward season has been the oppor-

to speak of the Roses. This untoward season has been the opportunity of many an early blooming and of some non-exhibition Roses, and makes me more than ever desirous of seeing a class for

Roses, and makes me more than ever desirous or seeing a class for Roses not in the seventy-two of the Rose election. Several such were to be seen at Tunbridge Wells, among them Lord Raglan, Madame Derreux Douville, and William Griffiths really beautiful. For the top class (open, forty-eight) there were three entries, Messrs. Mitchell being first with a very creditable box, of course abounding in Teas; Souvenir d'Elise, Jean Pernet, Josephine Malton (syn. Madame Sertot), and Madame Guillot being superb. A new Rose about to be introduced by this firm was represented. Malton (syn. Madame Sertot), and Madame Guillot being superb. A new Rose about to be introduced by this firm was represented by a really beautiful flower, and if not an exceptional bloom it will take a good place as a show Rose. I saw it three years ago at the nursery, and thought it promising. It is a sport from Madame Clémence Joigneaux, quite distinct, of true rose colour, globular form, and with plenty of substance. Its parentage is to be detected in the foliage only. Messrs. Bunyard & Sons were second: and Mr. Piper, with his flowers comfortably if not becomingly couched on his well known green wool, was third. For twenty-four trebles Mr. Piper came first, and the Rev. R. Cox, Hales, second. Hales, second.

Hales, second.

The classes for amateurs were good. For tweaty-four Mr. F. Warde, West Farleigh, was first; Mr. F. B. Haywood, Reigate, second; Mr. H. T. Lambert, Bletchingley, third. For twelve Rev. Henry B. Biron. Canterbury, took first; Mr. A. Killick, Maidstone, second; Mr. T. F. Burnaby-Atkins, third; and Mr. W. Mercer, Hunton, fourth. The Teas, as usual this year, were

T. F. Burnaby-Atkins fourth.

In the above list of prize-winners the name of a local grower does not appear. It seems that Rose societies are doing much for the cultivation of the flower, for in the amateurs' classes the first prize for twenty-four, the first three for twelve, and all the prizes for Teas, were taken by members of the Maidstone Rose Club.

TORQUAY ROSE SHOW.

I REACHED Torquay in the midst of a gale of wind and torrents of rain, when I heard that the gale had caught the large tent where the Show was to have been held, had ripped up the canvas, broken the specimen plants, and entirely destroyed all hopes of a Show. The Committee, however, exerted themselves manfully. The Roses being in boxes were safe, and so a Rose Show was held in the Bath Rooms, and a very excellent display considering the season was held. Messrs. Curtis, Sandford, & Co. repeated their triumphs of Saturday, and carried off the chief prizes; their box of seventy-two contained many excellent blooms. Those two redoubtable champions of the West-Mr. Jowitt of Hereford and Mr. Baker of Exeterentered the lists for the twenty-five guinea challenge cup, and staged admirable collections.

In Mr. Baker's premier stand the following were excellent : Etienne Levet, Duke of Edinburgh, Marquise de Montemart, Madame Prosper Langier, Madame Clemence Joigneaux, Josephine Malton, Magna Charta, the first bloom of it I have ever seen; Souvenir d'un Ami, Mons. Noman, Camille de Bohan, Duc de Wellington, as only Mr. Baker can grow it; Charles Lefebvre and Duke of Connaught. In Mr. Jowitt's were some splendid blooms, especially Général Jacqueminot, in a style one hardly sees it with anyone else; Olga Marix, the finest bloom I have seen of it; Caroline Kuster, Wilson Saunders, Cloth of Gold, fine; Sultan of Zanzibar, very good; Maréchal Niel, Devoniensis, and Marie Rady. Mr. Curtis exhibited some fine boxes of La France, Marie Baumann, François Michelon, and Baronne de Rothschild.

Anything more cold and cheerless than Torquay on the 1st of July could not possibly be. I could not help contrasting it with my last visit, when all was bright and warm and its loveliness was seen to perfection, while the condition of the lowlying lands between it and Exeter was deplorable. And now as I write on the 5th there seems little hope of a change, and things look gloomy enough for all interested, not only in gardening pursuits, but in the material prosperity of our land.

Assuredly this year of grace 1879 will long be remembered, and that with no pleasant or sunny memories.

I also visited Mr. Radclyffe's garden, notes on which must be deferred.—D., *Deal*.

WORK FOR THE WEEK.

KITCHEN GARDEN.

THE Tripoli section of Onions for late spring and early summer use is so well known for its superiority as to need no comment.

Prepare at once the ground intended for this important crop.

The Onion luxuriates in a deep rich soil, and a tenacious soil is preferable to a light soil.

The ground will be in capital order for owing Onions after Cauliflowers, and it will merely require forking over. The principal crop should not be sown until the forking over. The principal crop should not be sown until the early part of August; but a sowing may now be made to afford a supply of young Onions in spring, giving preference to the White Lisbon and White Naples. Make a liberal sowing of Lettuce for a late supply and, if necessary, for transferring to frames. Hick's Hardy White Cos and Bath Cos Sugarloaf are excellent, with Neapolitan and All the Year Round of Cabbage varieties. The main crop of Endive should be sown without delay-Roundleaved Batavian and Green-curled. A first sowing of early Cabbage should be made. Carter's Heartwell, Hill's Incomparable, Wheeler's Imperial, and Wheeler's Cocoa Nut are admirable; Veitch's Atkins' Matchless and Little Pixie being small take up may be made, but it must be of the early varieties and in a warm situation. If a sowing of French Beans be made in a warm position where the plants can be protected in autumn with glass, a late supply will be insured. Make a good sowing of Turnips for autumn use. Plant out Broccolis as the ground becomes cleared of Peas and early Potatoes, but if there is not ground available for planting Broccolis, &c., until those crops are off, prick-out the plants rather thickly in beds, and transplant them as soon as the ground is available. Where kitchen gardens have been long established and highly cultivated the soil becomes very

exceptionally good; those of Mr. A. Killick, which stood first, being rich, which is certain to promote a rapid growth that renders the well grown, especially Madame Falcot, and nicely arranged. The plants unsuited to withstand a severe winter. In such soil it is Rev. Henry B. Biron came next; Mr. F. Warde third; and Mr. | well to plant without digging the ground so as to induce sturdy plants unsuited to withstand a severe winter. In such soil it is well to plant without digging the ground so as to induce sturdy growth. Plant out the Cauliflowers intended for autumn use and for lifting. Tomatoes on walls or trained to stakes should be well attended to in stopping all lateral growths, and when a sufficiency of fruit is set stop the leading shoots so as to direct all the energies of fruit is set stop the leading shoots so as to direct all the energies of the plants to the maturation of the fruit. Vegetable Marrows as they begin to lengthen should have the handlights removed, and the stems pegged down to prevent their being blown about by wind. Look well over Gherkin and ridge Cucumbers, removing the handlights after the plants are growing freely, thinning and stopping the growths as required, securing them by pegging. HARDY FRUIT GARDEN.

Fruit trees generally are making an unusual amount of wood, which must be stopped in good time so as not to unduly exhaust the energies of the trees, and so prevent by the exclusion of light and air the formation of flower buds for next season. The thinning of Apricots should be brought to a close as speedily as possible, and the growths restrained by pinching the forerights at the second or third leaf, removing superfluous growths altogether and laying in as much young wood as space will allow, having the spurs close to the wall so as to afford them the benefit of its warmth in furthering the ripening of the wood and in protecting the blossom. Clear away the blistered leaves of Peaches and Nectarines, as with the warmer weather clean foliage is being produced, and should have every encouragement in the shape of syringing in the evening of bright days. If there be the least trace of aphis, red evening or origin days. It there be the least trace of apins, red spider, or other insects promptly apply an insecticide, such as soft soap, 3 ozs. to the gallon of rain water, with a pint of tobacco juice added to each gallon, which will destroy most insects to which fruit trees are prone. For mildew apply The nailing and tying-in of the growths of wall trees must be systematically attended to, as when neglected they are liable to be damaged by wind. Vines trained to walls should receive their final disbudding, retaining only the shoots of which the foliage can be fully exposed to light and air, securing the growths close to the wall, in order to afford them all the warmth

Figs on the open walls should have attention in thinning the shoots, which must be kept moderately thin, as with the foliage much crowded the wood does not ripen perfectly. The shoots should be stopped at about the sixth leaf unless the growth be moderate, when it may be trained in without stopping, as also the leading shoots, the finest fruit being produced by the extension system. The shoots should be secured to the wall. Ground intended to be planted with Strawberries should be well manured and trenched, though in case of shallow soils it is not advisable to bring up the though in case of shallow soils it is not advisable to bring up the bad soil, but it should be loosened, and if a good dressing of manure be placed there it will assist the plants in withstanding drought. Plants should be prepared by layering in small pots, selecting runners from fruitful plants, and when they are well rooted plant without delay. Vicomesse Hericart de Thury, President, Lucas, James Veitch, Dr. Hogg, and Unser Fritz are good varieties. On light soils Sir Harry, Sir Joseph Paxton, and President do capitally. If the late-forced Strawberry plants be ont out, the soil well firmed about the ball, and a good watering put out, the soil well firmed about the ball, and a good watering given, they will afford an abundant crop next season. Newly grafted trees should have the ligatures loosened. A stick thrust-into the ground and the graft secured thereto will make it safe from the wind in the matter of dwarfs, but standards that have been headed back should have a stick tied to each arm and pointed in the direction of the graft, to which the latter may be secured as it grows. Budding may now or shortly be followed be secured as it grows. Sudding may now or snortly be to nowed up with fruit trees generally, and may be practised on wood of several years old as well as on younger, providing the wood is not hard or rough from age. In the case of trees too old for working it is better to head them down early in spring and bud upon the young wood when sufficiently matured in summer.

PRUIT HOUSES.

Melons.-It is important that the late plants be planted out without delay, especially where the means of affording artificial heat is confined to fermenting materials. Whether grown in pits or frames a sufficiency of fermenting materials should be used to raise a bottom heat of about 90° so as to start the plants quickly. In houses as the crops are cleared, the plants if exhausted should be removed, and preparations made for a fresh start at the earliest opportunity; but if the plants are in good health it is sheer folly to root them out, as they will come into bearing again much sooner than young plants, and are in every way more tractable; indeed if the plants are not overcropped, do not suffer for water at the roots, and the foliage is kept healthful, they will continue bearing as late as is desirable. When the crop is cut the plants should be divested of most of the old or damaged leaves, fresh growths being encouraged in the place of any exhausted, which should be cut away. The surface of the bed should be loosened and the loose surface soil removed, applying a couple of inches of fresh loam, giving a good watering, and when growth is taking place afford a good application of liquid manure, and then treat as for former crops. When Melons are grown upon the

continuous system it is well to note that the laterals will grow somewhat freely and show fruit abundantly after a few joints of growth. The flowers after being impregnated will set and the fruits will swell freely, so that sufficient moisture only need be accorded to maintain the plants in continuous bearing. Attend to stopping, thinning, tying, or otherwise regulating the shoots, not allowing pressure of work in other departments to interfere with this, or the results will be so detrimental as to be difficult of remedy. Successional plants should be earthed up as soon as the roots show at the sides of the hillocks, making the soil firm, being careful that the plants do not suffer by want of water, and on careful that the plants do not suffer by want or water, and on the other hand are not too wet. To plants swelling off the fruit supply liquid manure, but weak. Maintain a bottom heat of 80° to 85° for young plants, 90° with a moist atmosphere to growing crops, syringing freely excepting when the fruit is setting or ripening, being careful not to allow one or two fruit to take the lead, but have them all as nearly as possible of one size on a plant.

PLANT HOUSES.

Ferns.-Plants that did not require more root space at the general potting in the early spring will now need it as well as any small plants that had a shift in spring. Shift all plants therefore that require it, making sure that the water can pass away freely, for though moisture-loving plants they are impatient of stagnant water; therefore the drainage must be thorough, and for any that have delicate roots a few pieces of pot or charcoal mixed with the compost will be an advantage. Good fibrous peat answers well for most Ferns, but fibrous loam is by some preferred for Adiantums. Pterises &c. grown for cut-Good fibrous peat answers well for most Ferns, but fibrous loam is by some preferred for Adiantums, Pterises, &c., grown for cutting. Gleichenias should never be allowed to have their creeping rhizomes injured through want of room. There must never be any lack of water, as when the young fronds flag they never again recover so as to attain their proper size. Gleichenias require particular care in this respect, also Tree Ferns, especially Cyatheas, Alsophilas, &c., as if ever they become dry at the roots when making fresh growth disfigurement is sure to follow in both form and colour. Afford no more shade than is necessary to prevent excepting, and ventilate moderately as anything approaching to scorching, and ventilate moderately, as anything approaching to a close confined atmosphere is sure to result in attenuated growth. Keep insects well in check, especially scale, as if once it obtains a hold it is difficult to keep the plants clean. Thrips may be subdued by fumigation with tobacco, but it must always be done with care, as the effect of an overdose will be objectionably apparent until fresh growth is made.

Pot Roses for flowering in winter and spring must have every attention paid to them, encouraging them to make all the growth The plants should be plunged in ashes in the full sun, and not too close, mulching the surface of the pots with some rich

and not too close, mulching the surface of the pots with some rich material, as rotten dung, watering twice a week with liquid manure, never allowing them to get too dry. Aphides and red spider must be kept under by syringing if necessary with a solution of soft soap, 3 ozs. to the gallon of water with a pint of tobacco juice added, and if mildew appear dust with sulphur.

Orchids.—This is a good time to pot Cattleya Mossiæ and Lælia purpurata, as they will be starting into fresh growth, being careful not to injure the eyes. If the potting of East Indian plants is completed the surface of the soil may be covered with fresh sphagnum or be planted with some small-growing Selaginella. The Ansectochluses when growing and in good health should have plenty of water; those grown under beliglasses should have a crock placed so as to keep the glass tilted to admit air, for if that be not attended to the plants will decay. It is a good plan to remove the glass for an hour or two every morning. Plants be not attended to the plants will decay. It is a good plan to remove the glass for an hour or two every morning. Plants having completed their growth for the season may be removed to a cooler house with an average temperature of 60° without sun heat. Dendrobium nobile and many others of the genus frequently make a second growth if kept in their growing quarters, which may be obviated by placing them in a house with less heat and moisture, at the same time affording them more air. Cattleyas when growing require plenty of moisture to enable them to make plump pseudobulbs. Supply Calanthes with weak liquid manure, and snonge the leaves frequently to keep them free from thrips and sponge the leaves frequently to keep them free from thrips, red spider, and scale. Sobralias also require frequent sponging, and the syringe must be plied freely to keep red spider down. Thunia Bensoniæ and T. alba flower at this season, and are valuable, requiring similar treatment to Calanthes. Ventilate the houses about seven o'clock in the morning and close them about four o'clock; syringing all blocks and plants overhead, especially after a hot day. Many Odontoglossums and Masdevallias will now require a shift, especially those which are growing strongly and require a shift, especially those which are growing strongly and have filled their pots with roots. Supply plenty of water to the roots of those growing freely, using the syringe frequently, and employing every available means to keep the Odontoglossum house cool by sprinkling plenty of water about the floors and ventilating freely, the bottom ventilators being left open all night. All winter-flowering plants will do better in pits than in large houses where they are generally sopiled through heigh kept at

houses, where they are generally spoiled through being kept at too great a distance from the glass and not having sufficient light and air to make a strong growth, for as a rule the more sturdy the plants are the more satisfactory will be their flowering. Keep all plants clean. Thrips are best subdued by repeated

fumigation, and for scale there is no safer remedy than picking off the insects whilst young and sponging such plants as will bear it with soapy solutions. We find nicotine soap at the rate of it with soapy solutions. We find nicotine soap at the rate of 3 ozs. to the gallon very effectual against scale and mealy bug, it being syringed on the plants or applied with brush or sponge; it does not appear to injure the most tender foliage, and unlike many other insecticides has a pleasant camphoric odour. It is equally effectual against red spider, thrips and aphis. Look over roof climbers frequently, thinning out the growths where necessary, and otherwise tying and regulating so as to keep them within reasonable limits, and at the same time further their flowering by admitting air and light to them as well as to the plants beneath.

TRADE CATALOGUE RECEIVED.

G. Brunning & Sons, St. Kilda Nurseries, Melbourne,-General Plant Catalogue.

TO CORRESPONDENTS.

_ All correspondence should be directed either to "The Editors" or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request

that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense. Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

through the post.

IRISES IN POTS (Irish Subscriber).—The plan you propose of potting the bulls or tubers and plunging the pots quite over the rims in a border, and allowing them to remain there until the flower spikes are visible, then removing the plants to the greenhouse, would no doubt answer and produce beautiful flowers under glass. It would not be advisable to place the plants in the greenhouse immediately the growth appears in the spring, as they would, unless in a very light and airy position, become drawn, and would not flower satisfactorily. A better plan would be to place a low frame over them in the border, or simply to affix some boards on edge, and place some frame lights across the plants for affording protection in spring and to accelerate their blooming. When thus prepared the plants must have subundance of water, light, and ventilation during the period of active growth. When Irises are established in the open ground and the soil is suitable and tolerably well drained it is not necessary to take them up anually. You can probably obtain the other information you require by writing to Mr. J. S. Ware, Hale Farm Nurseries, Tottenlam.

SILEME PENDULA (Amaleur).—This and its variety compacts should be

ing to Mr. J. S. Ware, Hale Farm Nurseries, Tottenham.

SILENE PENDULA (Amaleur).—This and its variety compacts should be sown in drills a foot apart in July, the plants being afterwards thinned to 6 or 9 inches apart; they then become of good size and hardy, and flower early in the following apring. The flower you have sent is Limnanthes Douglasii, the seed of which should be sown in Angust and the plants treated similarly to the Silenes. Both these annuals are quite hardy, requiring no protection during the winter, provided the seedlings have been timely thinned, so that they assume a sturdy habit. The Conifer you have sent is Thuja aurea.

sent is Thuja aurea.

WINTERING ALTERNANTHERAS (C. T. H.).—We find no plan better than taking up a few plants in the autumn before they are touched by the frost (which is very important) and potting them in 5 and 6-inch pots, using a compost of half loam and half leaf soil, wintering the plants near the glass in a pit having a minimum temperature of 50°. A dozen or two of good plants thus preserved (and we rarely lose any) give thousands of cuttings in the spring. If, however, you have tried that plan and failed you may pot some very small plants now, and establish them in 4 and 5-inch pots, and if these plants have a slight shift in the spring they will yield a profusion of cuttings for propagation. The plants may be grown in a cold frame, or be plunged in ashes outdoors during the summer, watering them copiously when the pots are filled with roots. Alternantheras are often lost in winter by attempts to preserve them in cold greenhouses. The species employed in carpet bedding are stove plants, being natives of Brazil, and must be treated accordingly.

GLAZING A VINERY (R. G. M.).—We have had no experience with the

must be treated accordingly.

GLAZING A VINERY (R. G. M.).—We have had no experience with the system you name. Write to the patentee and ask him to supply you with the addresses of those who have adopted the mode in question, and from whom you can obtain reliable information. We know that bedding the squares well and firmly in putty, using no top putty, answers well, the squares being made safe and firm with small copper brads or "sprigs," such as are often used by bootmakers. When no top putty is used it is not necessary to "rabbet" the sashbars so deeply as usual. We think the mode of glazing to which you allude is good, and you will do well to obtain information respecting it from those who have actually tried the plan before you erect your large house.

erect your large house.

LYCOPODIUMS (J. T. S.).—From your remarks we think that the plant is a Sclaginella, and not a Lycopodium; if such be the case it is probably S. Kraussiana, which is the commonest of the species, and often wrongly named S. denticulata or S. hortensis. The S. Kraussiana already mentioned is a native of South Europe, and consequently succeeds in a medium temperature, although it will endure much cold if protected from an undue degree of moisture at the same time. During spring and summer a greenhouse, or in fact any structure, is well adapted to its requirements, and it may be planted as an edging to paths or under stages in houses, or if grown in pots it forms a pretty edging for long shelves of plants. The soil should consist of fibrous peat, sand, and loam, good drainage and abundance of water during warm or dry weather being essential to its success. It may be readily increased by dibbling into pots, pans, or borders pieces of the branches, the smallest portion of which will root and rapidly increase in size. We may observe that one point of distinction between Lycopodiums and Selaginellas is that the latter have two different forms of leaves, one being smaller than

the other. Assuming your plants to be S. Kraussiana, if you insert cuttings or sprays now in small pots and keep them close and moist in a shaded frame until they are in active growth, then admit more air, you will have healthy tufts in a few months, which will winter much better than older plants.

LIQUID MANURES (John Ellioit).—Soot may be used for the purpose you name, but powdered charcoal is much better and more effectual if added at the rate of two or three handfuls to a gallon of urine. The urine must be diluted with five or six times its volume of water. One ounce of superphosphate of lime may be safely mixed with a gallon of water if inteuded to be employed for general garden crops out of doors, but for plants in pots not more than half an ounce should be used per gallon of clear water. In stimulating plants with liquid manure make it a rule to supply it weak but frequently, as if a plant is deluged with powerful manurial applications it is generally injured more than it is benefited.

STRAWBERRIES FOR FORCING (Amaleur, Taunton).—Of the varieties you name Black Prince is the earliest, Comte de Paris next, Dr. Hogg being only reliable for late forcing. Perhaps the most useful of all Strawberries for forcing is Vicomtesse Héricart de Thury (Garibaldi). La Grosse Sucrée, Keen's Seedling, and President are all excellent varieties for forcing. Were we limited to two varieties we should choose the first and last varieties we have named.

PRIMULA CORTUSOIDES AMENA (Idem). The plants are very liable to lose their foliage when kept in the greenhouse after they have ceased Bowering. They are much better placed in a cold frame in a rather shaded position, the pots being plunged in ashes; but a better plan than that even, and simpler, is to plant them out in good soil in a partially shaded border, potting them again in the autumn. In well-drained positions the plants are quite hardy. We saw some fine clumps flowering this spring on the rockery at Chiswick, the plants having had no protection during the winter. Cyclamen europeum flowers in late summer or early autumn, C. coum in early spring.

FICUS ELASTICA UNHEALTHY (N.).—If the plant did not receive injury by the severity of last winter it has been either too dry or too wet at the roots. Turn it out of the pot, and if the roots are not healthy and active remove a portion of the old soil and repot the plant in a clean well-drained pot, keeping it partially shaded for a time, and sponging the leaves frequently with tepid water. The flower you have sent is of Polemonium ceruleum.

SEEDLING PANSIES (L. J. K.).—The varieties are showy and suitable for border decoration, but none of them possess the properties required by florists in flowers for exhibition purposes. No. 6 is pretty, and may improve in substance when propagated from cuttings.

CABBAGE PLANTS INJURED (Della).—It is impossible for anyone to determine the cause of the injury of which you complain from the small scraps of roots sent. The plants appear to have been kept too long crowded to getber in the seed bed until their stems became woody, and then did not make fresh roots freely after having been planted, possibly owing to an extremely cold and wet state of the soil.

ONIONS FAILING (Dan).—Many beds of Onions were much injured this spring by the dry easterly winds that blew so fiercely as soon as the plants sppeared above ground, and the plants thus crippled being overtaken by drenching rains were unable to grow with any freedom. Assuming the soil to be suitable we can only suggest that the failure of your Onions is due to the extraordinary weather that has been experienced this year. Such plants as you have sent are beyond recovery.

CARROTE DYING (I. Playdon).—They are attacked by the Carrot maggot, and are incurable. Your other bed will probably share the same fate even if you give it a good dressing of soot, which is about the only remedy you can try with safety. You need not, however, be without Carrots in the winter, for if you sow seed of Early Horn at once the plants will have time to form good-sized roots, and in all probability will escape the attacks of the destructive pest.

APPLE TREE LEAVES SCORCHED (J. Burgen).—The leaves appear to have been scorched by lightning, though it might be the result of deleterious fumes coming in contact with them; but that would have affected the joung wood equally with the foliage, which is not the case in this instance.

Joing wood equally with the iolage, which is not the case in this instance.

Heating Small Greenhouse (Spero).—We do not think a paraffin lamp would answer your purpose, as it would require one of considerable power to exclude frost, and would consequently be expensive. A slow-combustion boiler with hot-water pipes would be more suitable having two rows of pipes—that is, a flow and return along the front of the house, the boiler being fixed inside the house. With care in attending to the fire there would be no danger of injuring the plants from the escape of smoke. We cannot recommend dealers, but you may obtain particulars of price, &c., by applying to those advertising in our columns, stating what you require.

Vines Unhealthy (J.S.).—The leaf sent shows signs of indifferent.

VINES UNHEALTHY (J.S.S.).—The leaf sent shows signs of indifferent support, the roots not being in an active state, which may have been occasioned by overwatering. It is unreasonable to apply water in the quantity you name without any regard to the condition of the soil at the time. We should say the heavy waterings have made the soil sodden, and many of the roots have perished. One-third the quantity of water would be ample, provided the roots were active. We should mulch the surface of the boxes with some short manure, and apply liquid manure at every alternate watering, allowing the laterals to extend so as to promote root-action. The white spots on the Peaches and Nectarines are probably caused by mildew, which abould be rubbed with flowers of sulphur, also dusting the leaves freely with the sciphur.

WISTABIA TREATMENT (J. Sargent).—The long growths should be trained about a foot distance apart where there is space, and those not required for that purpose should be pinched or cut back to two or three joints, so as to form short stubby shoots or spurs.

form short stubby shoots or spurs.

Boses Not Flowering (A. B. C.).—The plants have not had the wood well ripened. Shorten back the long shoots to about half their length, so that when they break again the eyes at the base of the shoots will not start into growth, and plunge the plants in ashes outdoors in a sheltered sunny situation, allow each plant plenty of room, and water with liquid manure occasionally. They may afford a few flowers in autumn, being more likely to do so outdoors than if retained under glass. The leaves sent have been infested with caterpillars, which should be sought for and destroyed. Do not mix the tank manure with guano, but apply them separately, preference being given to the latter.

PRAS FAILING (G. L.).—The soil has become exhausted from continued cropping and manuring solely with organic substances. Though the subsidistic chalky we should not hesitate to apply a dressing of line at the rate of a hundred bushels per acre during dry weather in late summer or autumn before digging the ground, or in March before putting in the crops. Do not dig any manure into the soil for a time, but mulet the surface instead with short manure, and in dry weather water copiously. It would be a permanent improvement to the soil to give it a good dressing of fresh loam, the top spit of a pasture taken off with its turf, mixing it with the old soil in the process of digging or trenching, and if it were of a clayey or tenacious character it would enable the crope to withstand drought better.

PROLIFEROUS DAISY (A. C.).—It is a well-known variety of Bellis perennis, and is popularly known as the Hen-and-Chickens Daisy.

DESTROYING AMERICAN BLIGHT (J. H. C.).—Your Apple trees appear by your description of them to be attacked by the above destructive insect (Aphis lanigers). You may destroy the pest with paraffin or methylated spirit, applying either with a small brush to the woolly clusters, but not to the smooth bark of the trees.

TRIFES AND SCALE ON PLANTS (E. H. C.).—Your plants have been infested by the above insects, and the leaves are now encrusted with dirt and impurities. It is impossible that the plants can flourish when in such a state, and almost impossible to clean them without sponging the leaves with soapy water. If you syringe them frequently with soft soap water, 1 or 2 ozs. to the gallon, at a temperature of 100°, you will clean them to some extent, but any leaf you can reach should be sponged. We should place all the plants that are moveable out of doors, and the rains will benefit them considerably.

NAMES OF PLANTS (E. S. W.).—We do not undertake the naming of varieties of florists' flowers; they are far too numerous, and many of them so much alike that they can only be correctly named by comparing them with others in a large collection; besides, the truss of Zonal Pelargonium which you simply enclosed in a letter was, as are many other flowers sent in the same manner, so much crushed and flattened as to be totally beyond identification. (A Young Botanist).—I, Gymnadenia conopsea; 2 and 3, Orchis maculata; 4, 0. Morio; 5, 0. ustulata. (A Young Gardener).—I, a Verbascum, but the flowers were too withered for identification; 2, Chrysanthemum frutescens; 3, Begonia parvillora. The red-leaved Begonia is probably B. ferruginea. The specimen with variegated leaves is Coprosma Baueriana variegata. (T. W.).—I, Adiantum pubescens; 2 and 5 appear to be A. Capillus-Veneris; 3, Gymnogramma chrysophylla; 4, Petris serrulata C, Adiantum cuneatam; 7, Pteris serrulata cristata; 8, The frond was very young, but it resembled Adiantum anabile. (Pen and Ink).—Armeria vulgaris (Thrift). (E. C.).—6, Crategus Pyracantha; 7, Rhododendron ferrugineum; 8, Weigela rosea; 9, Deutzia scabra; 10, Taxus buccata; 11, Cryptomeria japonica.

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

SUBURBAN VILLA FARMING.

(Continued from page 17.)

WHEN the best butter-making cows, such as we have been alluding to, bring their calves, the calves should not be retained longer than three days, but then be sold for what they will fetch. When they fall the cow should be milked nearly dry before allowing the calf to suck, and this should be continued until they are sold. The first day's milk may be given to pigs, and afterwards until the milk comes pure and fit for making perfect butter. The calves cannot be retained with advantage, as these breeds never pay for making into veal, the only exception being when the owner desires to keep a calf and wean it from a favourite cow. It may then be weaned and never suck the cow at all, but be taught to drink and receive new milk for a week, and then gradually be reduced down to skim milk only, until it begins to eat. Before noticing the mode of feeding we recommend it should be arranged so that all the stock on the farm should have free access to lumps of rock salt at all times. In ordinary seasons spring feeding may be commenced about the first week in April, as most grass land will furnish food at that time more or less; and we approve of feeding the grass early, so as to keep it short and closely fed during spring and summer also. Although we have ample supplies of food for cows, the produce of the arable land, to supplement the pasture grass from this time, yet an allowance for each cow of from 2 to 4 lbs. of bean or maize or cake meal per day may be added with profit.

The first cutting of Italian rye grass will be ready at this time if the best foreign seed has been sown and well manured with nitrate of soda or liquid manure, and the second cutting will probably be ready the second or third week in June. In the interval between the first and second cutting trifolium will be ready, and if both early and late sorts are grown it will continue fit for soiling until the middle of July as supplementary food. In order that there may be no deficiency, mangold should be held

over the produce of the previous year for summer feeding and until the autumn, when the root crops, such as cabbage, kohl rabi, Thousand-headed kale, tall rape or coleseed, will be ready. We must, however, allude to a capital food for dairy cows grown by some parties in the south of England—viz., gourds, pumpkins, American squashes, and the largest sorts of vegetable marrows. We have known these grown to some considerable extent, so that the cows may have them drawn in cartloads on to the pastures, and we understand that when eating these fruits the cows make the most perfect butter, quite equal to grass, and far better than can be made from mangolds, carrots, parsaips, or cabbages. It is said that upon analysis made by Dr. Voelcker he reported that it was calculated to produce butter of fine quality. These fruit will last during August, September, and October if cultivated for the purpose, as they sometimes are, between and amongst mangolds.

After October root-feeding will commence in earnest, beginning with cabbages, then kohl rabi, carrots, and parenips, reserving and storing mangolds to make good any break or deficiency in the food during the following summer. When root-feeding is commenced 6 or 8 lbs. of well-made park or upland pasture hay should be given twice a day, this when well made having an agreeable aroma arising from the sweet-scented vernal grass (Anthoxanthum odoratum) which it usually contains. Some of the before-named roots or vegetable food may be given twice a day, about 25 or 80 lbs. at each bait, passed through the cutter and mixed with meal at the rate of 2 or 8 lbs. each bait of beans, maize, barley, oats, or decorticated cotton cake, meal, or the bran of wheat. These are valuable adjuncts when strewed over and mixed with the cut or pulped roots, as it is better for the cows and attended with less waste than when the foods are given separately, although the above must be considered liberal feeding. Our plan is to put some clean sweet straw, either of wheat or oats, in the racks at night, and whatever portion may be left in the morning is used for littering the pens. When, however, the cows are dry and in calf the above food is too good for them, and we recommend that they should receive their food minus the meal or cake to prevent their making fat internally, the disadvantage of which we have previously alluded to.

We will now allude to the horses which we have stated as probably required, and will suppose to be two nag horses and one farm horse, the provision for them commencing in the spring with an allowance of green fodder, the same sort as provided for the cows. Some gentlemen, however, prefer that the riding and driving horses should have one hundred pounds of hay per week, or hay mixed with a portion of green fodder, in addition to the usual allowance of corn and pulse, which may be defined as being one bushel of oats and half a bushel of beans per week. This idea will not apply to the working farm horse, which will of course receive green fodder ad libitum as long as it lasts, with one and a half bushel of oats and half a bushel of beans. When the green fodder fails a plan of feeding to be continued during the winter should be adopted. One hundred pounds of pasture hay in chaff, with one and a half bushel of bruised oats, and half a bushel of cracked beans, and half a hundredweight of Belgian carrots per week, will be found sufficient for horses for fast work. For a farm horse in full work two bushels of oats, half a bushel of beans, one hundredweight of hay, and one hundredweight of carrots per week will be none too much, always being careful to give horses only a moderate quantity of pure water, and never allow them to drink at a pond or trough, because in that case the quantity cannot be regulated, which is most important in preserving them in health and sound working condition.

Some pigs must be considered a necessary portion of the live stock, not only for furnishing pork, bacon, &c., for family consumption, but for the purpose of consuming milk, vegetables, and refuse from the farm and garden. It then becomes a question whether it is best to buy-in a certain number of young animals at about twelve weeks old or to keep a breeding sow. We incline to the former, as being less trouble and capable of furnishing all the meat required. The only exception that we can take to the purchase of young pigs is that at present in some districts typhoid fever exists, and in our purchases we cannot be sure of avoiding the malady, which is not only very infectious but very fatal. The number of young pigs bought should be somewhat in accordance with the food available from the produce of the farm and gardens; it is well at any rate to have pigs of two ages, and of two different stages in feeding or fatness, as meat will then be nearly always ready when required. Young fat pigs called quarter pork will be wanted as well as pigs of larger size for bacon; it should therefore be considered what breed of pigs will be the most suitable under such circumstances. We know no breed so well adapted to furnish the best meat at an early age as the Berkshire. From other breeds we may obtain early maturity or fatness of the meat, yet it is desirable for family use at various weights and ages that the pigs should yield the largest portion of lean meat as well as fat at a given age. In fact some of our celebrated breeds of pigs if killed at the weight of 70 or 80 lbs. would yield but very little lean consumeable meat. No doubt but the mode of feeding would have an effect in producing an excess of either

fat or lean. In considering this matter it must be remembered that one of the objects of keeping pigs at all is the consumption of inferior vegetable food, both from the field and the gardea, and wash from the villa, and that will be sufficient to keep the animals in a lean and growing state. But to keep them not only healthy and make them fat enough to kill for pork resort must be had in the first place to beans or peas cracked to form lean meat, and next to the fatting with meal. The latter can be done best, having regard to economy in feeding and production of meat, by feeding with the meal of beans, peas, maize, and barley in equal quantities, wet up with milk. The quantity of food to be given in the twenty-four hours we cannot attempt to define, we having a rule to recommend which never fails to produce the best results—viz., to regulate the quantity so that when the animals have done feeding and leave the trough no food should be left therein. Feed only twice a day with regularity, as this will give the animals time to sleep and digest their food.

In villa farming there are a variety of ideas and fancies to be satisfied. In some cases we find a goat is approved; if so, it should be the large variety, which are not only more docile but will give a larger quantity of milk. It should be tethered, as this kind of stock are often mischievous in various ways, especially the smaller kinds. It is sometimes, too, that a pet lamb or sheep is kept; they are generally very quiet and harmless, and will feed without difficulty or attention with the cows, and may live in the same way and in their company. Poultry will always be required: the choice of sorts and kinds will of course vary with the tastes and wishes of the proprietor, and their management has been so often and so well treated of in these columns that we shall not further allude to it at present. The arrangement of the buildings, &c., at the farmery will have our attention in the next and concluding article.

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour.-This has been so much delayed through the month of June that much work peculiar to that month has been put off entirely on account of the weather having been adverse to the cultivation, cleaning, and preparing the land as usual for root crops. Various crops requiring seed and tillage to be done in a practical manner will now be pressing, and the horse power will be taxed to get the land fit for the seed of turnips, &c. This is, be taken to get the heat time to put in the seed for the main crop of turnips to stand the winter to be fed off by sheep stock until the Swedes are ripe at the usual time, January and February. The best roots that we know of amongst the great variety of turnips which are offered by the seedsmen are the Grey Stone and the Purple Top Mammoth varieties, and they are nearly allied in their feeding qualities, their capability of withstanding the changes of climate, &c., and their adaptability for growth upon the various of climate, &c., and their adaptability for growth upon the vanous soils, and for both early or late sowing. They are therefore admirably suited for sowing after green fodder crops or as stubble turnips. The harvest, however, will this year be so very late that the prospect for a full produce of turnips after a cereal crop is not at all encouraging. The drilling of the seed may be done to the best advantage daily between the shocks of corn as fast as it is cut and set up. When the horses are hindered by the weather the fallows intended for wheat may receive another ploughing in the fallows intended for wheat may receive another ploughing in order to keep down the growth of weeds, &c., for fallow ploughing may be done at a time when the land is too damp for the ordinary preparations at seed time for turnips, &c. We can recommend the seeding of tall rape or coleseed at this time either for feeding off by sheep or for cutting up for soiling dairy cows. This food is the very best of all for the production of milk in large quantities and of butter of the finest quality. We say tall rape, because the dwarf rape cannot be used for the same purpose with the like advantage, the difference being that the tall rape when sown thick will continue to grow up in long succulent stems, but the dwarf will die away and leave a large number of short naked stems of a wiry character. Unless the crop is taken in time by feeding or cutting it will not keep and retain its produce and quality, for in the course of a week or two if not used the leaves turn purple, then yellow, and fall, leaving only a small green heart at the top of the stem about the size of a primrose.

Hand Labour is for the most part superseded by the machine for the mowing of grass crops, except in the case of water meadows, where the deep and numerous water carriers and drawing trenches offer a serious impediment to cutting grass with the mowing machine. Therefore these meadows afford nearly the only opportunity for hand labour in mowing with the scythe. The hoeing of mangolds, carrots, Swedish, and common turnips will now be going on, and in such a season of showery weather as we have passed through, should it continue the weeds must be cut up by hand-hoeing, even if the land is too damp for them to die off. There is, however, the greater necessity in such cases to hoe the weeds in their infancy, many of which would then die off; but when they are left to get strong before hoeing, they not only live but compete with the crop and dispute the possession of the soil, and at the same time feeding upon the manures placed in the soil for the benefit of our vegetable productions. In a season like the

present there is a great advantage where the root seeds have been put in upon the stetch, because in that case the horse-hoeing may take piace and be done effectually at any period during the growth of young plants, without any probability of burying or injuring them, as is often the case when the seed is drilled upon the flat, more particularly when the weather is adverse.

Buying in the stock of Hampshire, Dorset, and Sussex Down sheep will now be going on, and large numbers of lambs are now being purchased to go into the midland and other counties, at being purchased to go into the midiand and other counties, at the early fairs in Hants, Wilts, Dorset, and Sussex: the principal being Stockbridge, Overton, Alresford, and Weyhill in Hants, Britford and Wilton near Salisbury in Wilts, Dorchester in Dorset, and Lewes, with some others in Sussex. The practice of shearing the lambs bought at these early fairs, especially those from Overton, Alresford, Britford, and Lewes, is to be recommended, for although wool is now at a comparatively low price, yet the advantage will be found in the will defined the advantage will be found in the will defined the advantage will be found in the will defined the advantage will be found in the will defined the state of the absolution of the state of the st tage will be found in the well doing of the sheep during the autumn and winter months. This applies with much greater force to the crossbred sheep than to the pure breeds of either Hants, Dorset, Wilts, or Sussex; for we know during several years past when wool was dearer that the clip of wool from those crossbred between the Down and Cotswold had made from 7s. to 9s. per head when taken in the month of August and sold in the grease. We have further noticed that these animals when sold in the market as mutton have made long prices, and at the same time have yielded when killed heavier weights for the food consumed than they would have done if they had been kept and sold in their teg fleeces.

KERRY CATTLE AT KILBURN.

THERE were no less than twenty-nine entries of Kerry cattle at the International Show of the Royal Agricultural Society at Kilburn, and this afforded an excellent opportunity for those who are interested in the extension and improvement of this valuable breed to form an opinion of their merits. An extensive breeder from the sister isle expressed his opinion that there never was a better lot of Kerrys brought together. The great attraction was the noted buil "Busaco," the property of Mr. Robertson of La Mancha near Dublin. For several years he has been the premier built of Ireland in the Kerry class, and though now over six years old he is still a handsome animal. To him the first prize of £20 was awarded. The next best, and which took the second prize of \$10 was "Purple" a granden of Russee best and which took the second prize of £10, was "Punch," a grandson of Busaco, bred and exhibited by Dr. Hogg of Streame, Horeham Road, Sussex. This little fellow was only a year and four months old, and was a great attraction in the yard on account of his perfect symmetry and smallness of stature. The third prize was awarded to Lord Clonmell's "Kerry

stature. The third prize was awarded to Lord Clonmell's "Kerry Recruit," bred by Sir Gerald Aylmer, Bart., Donadea. Kildare; an excellent animal, but as his place in the awards indicates, not up to the standard of those already mentioned.

In the class for cows Lord Clonmell of Bishop's Court, Kildare, took the first prize with his "Pride of Kerry," a handsome sixyear-old in full milk. Mr. Richard Good of Aherton, Cork, was second with "Norah;" and Mr. Peter Hay of Spike Island, Queenstewn, was third with "Little Beauty." Mr. Robertson's "Perilla" was highly commended; while Dr. Hogg's "Kitty," Mr. Good's "Molly" and Sir Richard Wallace's "Buttercup" received commendation. It is worthy of remark that the second prize for the mendation. It is worthy of remark that the second prize for the best butter in the Show, the produce of the United Kingdom, was awarded to Mr. Verschoyle of Ross, Herefordshire, for butter made from the milk of Kerry Cows.

FARMING BY RAILWAY.

A GREAT amount of farming has recently been done in railway trains, for thousands of people passing to and from the late great Agricultural Exhibition at Kilburn have discussed the condition of the crops and the prospects of the approaching harvest. My journey was outwards from London—route the Midland Railway; destination Leeds. As the subject of agriculture pertains immediately to the Journal, and a vast number are interested in the appearance of the crops at this juncture, the publication of my railway notes will not be inopportune. A Midland express may not afford the best possible facilities for surveying the crops, or at st the inspection of them is necessarily a fleety one and judgment must be prompt; yet I found a pleasant compensation, for if my journey was swift it was sufficiently smooth to permit of writing journey was swift it was summently smooth when the only to tear a with a considerable amount of comfort, and I have only to tear a few leaves from my notebook containing my impressions and send them to the printers. I may, however, first place on record two insedents—one at each end of my journey—of a somewhat remarkable character, and of a kind to account in a great measure for the unsatisfactory appearance of the crops. My journey began in a hadisterm and ended in a frost, for on leaving St. Pancras hail feil thick and fast, and early the next morning at Leeds the roofs of some large marquees were covered with a film of ice. This during the last week in June is conclusive evidence of the extreme insalubrity of the season. And now for my notes.

On emerging from the metropolitan precincts the first glimpse

of the country is a beautiful one. The landscape is undulated, wooded, bold, and fine, the district being literally strewed with flowers, the embankment being white with oxeye daisies, and the meadows beyond bright with buttercups; grass full but short, and if the long-expected summer arrives the hay harvest will be tolerably good. A comfall have and the confall beautiful to the short of the tolerably good. A corn field here and there presents a miserable appearance; barley being yellow, and yellower with charlocks; wheat short and poor, especially in the hollows; potatoes weak and late. Onwards towards Luton the prospect is no better —grass worse, corn weak, and covered with charlocks like a cloth of gold; fallows a mass of weeds, turnips not sown, clover full—this and the weed crop alone looking well; a field or two of seeds cut, lying in swathe flat, black, and wet—a dismal look-out. Rushing northwards we arrive at a district of larger fields, fewer trees, and smaller hedges; but although a better system of farming appears to prevail, yet the result so far is very disappointing. Barley yellow, only a tinge of green in the ridges; wheat not much better; fallows a mass of weeds; only a few acres of turnips sown; clover cut, black, and wet. Before reaching Bedford land, crops, and culture better; a few fields of wheat looking well and clean. The district passed through smitten with yellow fever—charlocks or wild mustard; but now more fresh, green, and healthy. Still northwards, grazing and arable land alternating; water standing in hollows, yet crops moderately good; grass green, but stock not over sleek. Onwards through a great grazgrass worse, corn weak, and covered with charlocks like a cloth green, but stock not over sleek. Onwards through a great grazing district; pastures fresh and good; sheep and cattle generally looking well. Northwards from Leicester farming better, but corn late and patchy, quite yellow in furrows; wheat better than barley; a few fields promising; beans, healthy but weedy; and some turnips above ground; pastures full, stock good.

More nearly approaching Trent crops of all kinds generally
better, but not one field of corn in a mile can be described as "May." This in July! Land wet and poor; crops ditto. On to Chesterfield the outlook generally very poor; crops, with few exceptions, late and badly coloured. Approaching Sheffield farming ends, and between the smoke-infested district of Sheffield and

ing ends, and between the smoke-infested district of Sheffield and that of Leeds there can be few if any lucrative crops this year.

From an sesthetic point of view the district passed through is pleasant, in places picturesque, but agriculturally the prospect is decidedly a gloomy one. Not two hundred acres of really superior wheat are visible in two hundred miles, while barley is worse, and only half a dozen fields of turnipe and three or four of mangold wurtzel are seen above ground along the whole journey. Weeds and wet, or its effects, predominate. It will be only by a miracle that farmers can make fortunes in the districts traversed; but, on the contrary, it is greatly to be feared that the majority will fail to make "both ends meet" during this extraordinarily trying and inclement season.-J. W.

POULTRY FARMING.—No. 2.

WE promised not long ago to give a sketch of our ideas as to how far poultry could be profitably produced on a large scale for the markets in this country. Since we made that promise we have been struck by the following observations in a leading article in the Standard one day last week. They refer to the great Show at Kilburn, and to its possible effect on the depression of agriculture. "We wonder whether the bee-keeping department will have any effect on English farmers. It still remains to be seen whether the cultivation of eggs, honey, poultry, bacon, et hoc genus omne, cannot be made to compensate for the falling-off in other things. Many people think it can, many people think it cannot. The experiment, however, has never been fairly tried it cannot. The experiment, however, has never been larily their in this country, for we cannot argue from the conditions of the last century to those of this." We thoroughly endorse the belief that the experiment has not been fairly tried, and we should be extremely glad to see it so made. We are now only occupied with two of the above-mentioned industries—viz., the production of poultry and eggs, and leave the consideration of the others to those who are more conversant with them than ourselves

An immense deal of harm has been done by rash writing. An immense deal of harm has been done by rash writing. To begin with, certain wild enthusiasts, who perhaps deceived themselves and certainly deceived the public, wrote much about the enormous profits which might be made by poultry breeding. Unfortunately some of their pamphlets sounded so attractive, from the promise of easily made gain which they held out, that they found far more purchasers and readers than they deserved. Their conclusions were not based on any real or practical know-ledge, and were, of course, found delusive. Those who had been unwise enough to place much confidence in them were naturally disgusted, sold their poultry, often at great loss, tore down their long rows of houses and wire fences, and returned to their original long rows of houses and wire fences, and returned to their original plan of buying shop eggs at 1d. a piece instead of producing them, as they had fondly expected, at 1d. a dozen. Most of the great authorities on the subject promptly flew to the opposite conclusion—viz., that it would be impossible ever to make poultry breeding profitable in this country. There is a great deal to be said for the reasons that they urge against it, such as these: that we have not in England the many small holders of land that

there are in France and Belgium, who can afford to give their there are in France and Beigium, who can afford to give their attention to such minor departments of the farm; that our climate is a bad one and unsuitable for the production of poultry; that hundreds of birds never have been and never will be kept near together without the periodical occurrence of epidemics, which often carry off half the stock. We cannot but think that though great weight should be given to all these considerations, yet that they are not insurmountable objections to some fresh and fair trial heir given on intallight principles to noultry farming. The trial being given on intelligible principles to poultry farming. The present seems for various reasons a peculiarly opportune time for the trial to be made. The first objection—viz., that such an oc-cupation is not suitable to the national system of farming, seems rather to beg the question. Besides, if the master and his men are well employed on the land and with the herds, there seems to us no sort of reason why the mistress should not be employed with Ducks and chickens to a far greater extent than is now common

The writer of the leader in the same daily paper goes on to observe, "It is not the exhibitor of prize bulls or prize turnips who feels most acutely the pressure of the present times. Feel it, of course, he does; but not at present in such a shape as to pinch him. It is the small man, who never fed a prize animal in his life, who is really being ruined by the present crisis, and who deserves our sympathies much more than the unsuccessful millionaire, who, our sympathies much more than the unsuccessful millionaire, who, as he knew nothing of farming when he entered it, has no right to complain of losses when he leaves it. The farmer is told that events will all come right; that every business has its bad times, and that if he can only hold out prosperity is again in store for him. But in that 'if' lies the whole gist of the matter. Thousands of men may be ruined while the system is righting itself, and we cannot refuse them our sympathy even if we refuse them our convictions." Our idea is that in this terrible crisis for the smaller farmers here described when the land will scarcely yield sufficient farmers here described, when the land will scarcely yield sufficient return to pay for its cultivation, and when ruin seems to stare many in the face unless they can tide it over, that it would certainly be worth while to turn serious attention to the production of poultry on a considerable scale. To the objection that our climate is too bad for it we can only say that we do not think so, but we shall by and by have something more to say on this point. The difficulty of keeping a large number of birds healthy when in close proximity is a real and very formidable one, and we can but give what seem to us the best means of obviating it.

we can but give what seem to us the best means of obviating it.

We have from time to time seen and heard of what by a strange
misnomer are called "poultry farms"—viz., long rows of pens or
small poultry houses, generally arranged on each side a central
covered passage, sometimes with and sometimes without small
runs attached to them externally. Such places are very nice and
convenient for amateurs, not in lieu of but as supplementary to
more extensive ranges. For breeding young Pigeons most of them
would be admirable, or for housing exhibition poultry during bad
weather, and protecting light-coloured birds from the sun; indeed, most varieties look the better in a show after having spent
two or three days on clean straw in such a place, but for keeping
fowls as profitable stock, much more so for rearing them, such fowls as profitable stock, much more so for rearing them, such establishments are worse than useless.

It is not long since we saw an advertisement to the effect that in some such place, covering about 2 acres, from £1500 to £2000 a year might be made by rearing birds for the markets. We venture to be positive that it would be absolutely impossible for anyone to make anything like a tithe of that sum, and anyone who honestly believes in its possibility must be totally ignorant of the whole subject. We shall not be so rash as to hazard any of the whole subject. We shall not be so rash as to hazard any plan for a poultry farm, much less shall we draw out any elaborate calculation as to the profits which might be derived from one. Figures may be made to prove almost anything, and those who have pretended to enter into them have done much harm. Our endeavour is always to be practical and to have opinions on facts alone for which we can personally answer. In the present instance our object is to point out clearly the chief difficulties of keeping a large number of birds congregated together, and to give our ideas as to how and how far these difficulties may be overcome. We can only do so on the analogy of the method by which they can be overcome when birds are kept in much smaller numbers. Such be overcome when birds are kept in much smaller numbers. Such analogies as we have before pointed out only partially hold good. Because fifty fowls may be kept in health on an acre of ground and yield a fair profit, it by no means follows that five hundred will do the same on ten acres. We do believe, however, that many of the difficulties on this score, and the risks too, may be much lessened by the intelligent distribution of stock over suitable ground, and by its systematic management on natural principles. The headings of the subject on which we hope to say something in order are—1 The land, position and climate most suitable for in order are—1, The land, position and climate most suitable for poultry in large numbers; 2, Their distribution and accommodation on it; 3, Their general management, and the breeds most

VARIETIES.

suitable for various requirements.—C.

On the occasion of the visit of the Irish farmers to Marlborough House last week, headed by the Rev. Canon Bagot and Mr. James

Robertson of Dublin, His Royal Highness the Prince of Wales caused a special warrant to be issued, conferring the distinction of "Seedamen to His Royal Highre's" on Messrs. Hogg and Robertson of Dublin, of which firm Mr. Robertson is the active

— We are informed that the Council of the Royal Agricultural Society have awarded to Messrs, James Carter & Co. a silver medal for the success that has attended their efforts in practically illustrating their system of laying down land to permanent pasture lawns, &c.

THE prizes offered by Messrs. Daniels, Brothers, for the heaviest and best three specimens of the Defiance Giant cabbage grown from seed supplied at their establishment have recently been competed for. Specimens were sent by over a hundred growers, and many of the cabbages were remarkable, not only for size but quality. The premier exhibits came from the Isle of Wight, and others from various districts. There were numerous competitors in Norfolk, but their specimens, though large by themselves, were small compared with the prizewinners. The following is the prize list:—First, Mr. S. Osborne, Old Park, Ventnor, Isle of Wight; weight 36 fb. 8 oz. Second, Mr. T. Creed, Kemsdale, Faversham, Kent; weight 35 fb. 14 oz. Third, Mr. E. Pitts, Mirables, near Ventnor, Isle of Wight; weight 36 fb. 12 oz. Fourth, Mr. E. Samuel, Sawston, Cambs.; weight 34 fb. 14 oz. Fifth, Mr. E. Nunn, Heybridge, Maldon, Essex; weight 33 fb. 4 oz. heaviest and best three specimens of the Defiance Giant cabbage

BEE-KEEPING AT CARLUKE.

LAST year my health improved during a stay of ten days at Carluke, which is a high-lying bleak country place in the centre of Lanarkshire. On my return to England I resolved to revisit the place and make a longer stay this year. In making arrangements to leave home for a season the apiary presented the greatest difficulties. Who could or would manage my bees if they were left? Nobody. So I resolved to take my bees with me, and hence made arrangements with the London and North-Western Company to carry them by passenger train (in a horse box), from Manchester to Carluke, a distance of two hundred miles, at a carriage rate of 14d. per pound. Well, on the 21st of June thirty hives and their owner left Manchester at 11 A.M., and arrived at Carluke at 6.40 P.M. Neither the hives nor horse box were sufficiently ventilated for a warm day in summer, and the bees suffered much by the way. The fault was wholly my own, as ample ventilation would have prevented the slightest injury to either combs or bees. My bees will be my playthings here for a while, and, weather permitting, they will gather honey enough to pay expenses and keep me in pocket money.

The spring months, it appears, have been more favourable for

bees here than in the north of England, for swarming commenced here in May this year. Many of the earliest swarms have their combs down to their boards already. I am pleased with all I combs down to their boards already. I am pleased with all have seen. Hives, though not very heavy, are strong in bees and able to do a great deal of work. The bee-masters themselves, most of them working men, are in fine tone and full of hope and enthusiasm. Their success in 1878 and other years gives them great confidence. Having had one, and in many instances two good swarms, from each stock hive already, all they now care about is weather. The profits last year in some instances were about is weather. The profits last year in some instances were greater than those which were mentioned last autumn in this Journal. Mr. James Rennie from eight stocks and their swarms Journal. Mr. James Rennie from eight scoras and then swanning realised £40, and good stocks for this year. From one hive and its swarms Mr. Caldwell sold honey to the amount of £8, and increased his stock threefold. This is encouraging work, and done by the sons of toil who never use artificial pollen or arti-

done by the sons of tool who hever use artificial points of all ficial foundations, or modern inventions of any kind.

The swarming mode of management is generally approved and followed here. Early swarming is aimed at, and two swarms from every stock hive are coveted. This year, which is a late one, the bees here began to swarm naturally in May, is a late one, the bees here began to swarm naturally in May, and May swarms generally speaking have their hives filled or nearly filled with combs by the time clover comes into flower. One bee-keeper told me yesterday that the honey of gooseberry bushes and sycamore trees is so green in colour that it is hardly saleable either in the comb or out of it. I was surprised to hear this, for I consider the honey gathered from these plants is richer and higher flavoured than either clover or heather honey, which take best and sell most readily in the markets of Edinburgh and Glasgow. The honey plant here that comes in immediately after Sycamore is field mustard, which yields a clear honey but after Sycamore is field mustard, which yields a clear honey but not very high flavoured. Well, there may be wisdom in keeping bees breeding and building combs to a great extent, while the least saleable honey is being gathered. Another reason, and the main one, for adopting and practising the swarming system, is the fact that it is the most natural and is attended with less risk of losing swarms. Practical men know well that there is immense and continual risk of losing swarms on the non-swarming system if bees are not constantly watched, and working men have not time to do this. Again, it is well known that with a multiplication of swarms within certain limits there is in good seasons a multiplication of bees, young queens, and combs, giving the beemaster a choice of stocks, and an opportunity of making stocks doubly strong in autumn by uniting the bees of honey hives to

those that are kept for stock.

Supering, eking, and nadiring are resorted to in giving bees room, and there does not seem to be existing here a prejudice against any of these modes of enlargement; and the hives in use against any of these modes or enlargement; and the lives in the admit and facilitate all the arts of apiculture, save and except what is called the moveable-comb system. While I admire, commend, and follow the practice of the bee-keepers of Carluke, I cannot fail to see and know that their great success is owing to the excellency of their management in a great degree. Everything is done at the best time and in the best manner, and this is the secret of success in all systems and with every kind of hive. Whatever is worth doing should be done well, and wherever this whatever is worth doing should be done well, and wherever his principle in farming, gardening, bee-keeping, and other pursuits is carried out with constancy the results are good and satisfactory. Inattention in bee-keeping with all kinds of hives and systems is a very short road to failure. Bee-keepers themselves are often more at fault than the weather, their bees, or their hives.—A. Pettigrew, Carluke, Lanarkshire.

WHAT A DIFFERENCE!

(Translated from the German.)

WHILE, according to the statements of men of science, the succession of changes of climate consequent upon the change of seasons takes place most regularly in many parts of the world, and more especially in tropical countries. in our own country the variations of climate are very great. This is especially the case as regards spring time, which sometimes commences early and sometimes late, and is otherwise very variable.

It will perhaps hardly be possible to determine the real cause of this difference, as the length of the days and the position of the sun in the heavens, as well as his power of radiating heat, remain the same from year to year. In my opinion the best explanation that can be given is, that when the masses of ice in the northern regions begin to move a larger or smaller number of these blocks or icebergs are driven by storms towards our shores, and we feel their effect in the prevailing low degrees of temperature.

Although this changeable weather affects every agriculturist, still more does it affect bee-keepers, for no other branch of industry is so entirely dependant upon weather as apiculture. Other branches of agriculture may still succeed in spite of high winds, cloudy sky, low temperature, &c., but bees are unable to collect honey and pollen if the temperature of the air be only one degree less than that at which they are able to work continuously; and if nevertheless they venture out visiting flowers, the injury to the colonies will probably be greater than any benefit to be derived from such excursions.

Of what bees are capable of doing early in the year if the weather favourable we had proofs in 1848, the year of revolutions. Though I do not keep regular accounts of the state of the weather, still many events, from their being out of the common, produce such vivid impressions upon the mind that they are remembered long afterwards. In the year referred to the warm weather set in so early that at Easter (about the 20th April) the blossoms of the were falling off after the bees had collected large quantibilberry were falling off after the bees had collected large quantities of honey from them. In my apiary at Bankwitz the bees had gathered so much honey in April from a field of rape in the neighbourhood, that towards the end of that month I was obliged, in order to give the bees more room, to empty the honey compartments filled by them with new combs which they had stored with honey. The hives were completely full of bees and capable of giving off swarms at this early time of the year.

giving off swarms at this early time of the year.

When I think of this and compare it with the sad state the stocks are in at the present time (nearly the middle of May) I feel stocks are in at the present time (hearly the middle of May) I feel inclined to exclaim: O jerum, jerum! quanta mutatio rerum! (how things have changed!) A greater contrast can hardly be imagined than a comparison of the spring of the present year with that of 1848 as regards the progress of the colonies. I do not remember breeding having commenced so late, and the development of the colonies altogether being in such a backward state for many years nast. When the weather is seasonable the bees in the hive at this When the weather is seasonable the bees in the hive at this combs completely, and any parts of comb which the bee-keeper may have cut away will be found to have been replaced by them, but at present they are still concealed between the combs. The population of the hives is much less than what it was in March, and they scarcely have as much brood now as is usually met with in the hives in the month of February when the winter has not been too severe. Our actual winter the bees survived in tolerably good condition, but the second winter we have passed through has proved most disastrous to them, and so has spring until now. The very elements seem to have broken loose. It is reported from Szegedin, which town has been visited with such a terrible inundation, that even after the dreadful catastrophe the works for repairing the dams to protect the town were repeatedly destroyed by the agitated floods; here also frightful storms have been raging, blowing off and destroying the roofs of the hives in

my apiary, knocking down entire piles of hives, and otherwise damaging them.

The heaviest loss, however, will be due to the present unusually depopulated state of even the largest colonies. The bees from sheer necessity rush out of the hive impatiently during a moment of sunshine and perish in large numbers on these excursions; and while pasture would be plentiful if only the weather were favourable, we are now obliged to go to the trouble and expense of feeding the bees in order to keep them alive. They were not able to utilise to any extent the flowers of the hazel, the aspen, the willow, or the cowslip, nor the very melliferous blossoms of the gooseberry, the flowering time of which is now nearly over. Their visits to the gooseberry blossoms were limited to one fine day, the consethe gossecery blossoms were limited to one one day, the consequence being that when on the following cold days they again left their hives, most of them were lost. The bilberry is at this moment in full flower, and is a great attraction to bees in the neighbourhood of woods and forests on account of the quantity of honey it yields; but its time of flowering will probably also pass without being utilised by the bees, for the temperature is so low that we had a fall of snow here last night, which, indeed, dispensed from the temperature of the state of the stat appeared from the ground the next day. Still an intensely cold north wind continues to blow, which makes it impossible for any bee to show itself outside the hive, and so far there does not appear any prospect of an immediate improvement in the weather.

prospect of an immediate improvement in the weather.

This deplorable state of things affects me most painfully, because I had engaged to supply fertile queens or small colonies of the beautiful, gentle, and industrious Italian bees. I am quite willing to fulfil my promises, but it will perhaps be a month later than I should have been able to execute the orders if the season had not been so exceptional. Circumstances indeed are stronger than the been so exceptional. Circumstances indeed are stronger than the will of man. Man is powerless against the forces of Nature, and compelled to put up with what is beyond his power to alter. I trust, then, that bee-keepers will not lose patience in these trying circumstances, but look forward to better times, which surely will succeed this unusually bad season. The Latin proverb is: Post nubila Phabus, or as we say in German, Auf Regen folgt sonnenschein (After rain comes sunshine).—DR. DZIERZON, Carlsmarkt, St. Panerel Oru, 1879.

St. Pancras' Day, 1879.

THE BEE TENT AT KILBURN.

(Continued from page 20.)

On the second morning of the Show the powerful gale and heavy rain of the previous night was found to have wrecked the tent and deluged many of the exhibits. The Hon. Secretary with admirable promptitude and energy at once set machinery in motion, which put all as right as bad weather would admit of by Wednesday morning, and in the afternoon amidst occasional drowning showers the driving competition took place. Of the four competitors Mr. Abbott, sen., occupied least time (14 minutes) and so won, while his son was altogether behind through failing to find his queen. Messrs. Baldwin and Martin were about 4 minutes longer than Mr. Abbot, sen., but since they drove in each case large skeps containing more comb by much to transfer than that found in the one handled by the winner the difference in time is accounted for. Mr. Martin drives admirably. He has a tub cut askew, upon which his skep is placed so that the part from which the bees are to run stands highest. Two of the staves at the side of the tub next the operator are removed, and the opening thus made gives an opportunity for putting on the skep roof. This he did occasionally and gently. The bees left well, while the jar was so slight that a swarm with combs just built might have been operated upon.

The hives are in many respects disappointing, as some of the exhibitors seem to be seeking rather novelty than utility or convenience. The first prize was awarded to Mr. Abbott for a very complicated arrangement carrying forty-six sectional boxes, some compined arrangement carrying forty-six sectional loxes, some of which in my judgment are badly placed beneath. The body contains the usual division boards, while the frames are set across the mouth. Zinc queen excluders with oblong apertures preclude ovipositing in the lateral and upper sections, but those beneath, which are most likely to be visited by the queen, are not so protected. The external surface of the hive is very great, and heat from it in chilly weather must be fully dissipated. Its one distinguishing feature in a contract bettle province from the result of the contract of the contract of the section of the contract of the section of the contract feature is a copper bottle running into a crown board made hollow to receive it. This bottle is to be filled with hot water to warm the sections which stand over it, so that the bees may be induced to accept them. It thus separates too much the sections from the main body, while, when the bottle has done warming the bees, the bees will have to warm the bottle. This is one of those improvements for which we venture to predict a short life. Mr. J. M. Hooker obtained the second prize for the most highly finished hive in the class, but which is entered "not for sale." The alighting board is low to save queens with defective wings and

for super work. The crate of supers is very ingeniously fixed with parallel wedges, while the carpet cover for this crate has two slate nailed to it, which drop over the sides when the carpet is in position and hold it at once.

Messrs. Neighbour stand No. 8. The sections are here placed in frames laterally and in a crate above, with queen excluders, straw in wooden frames forming the cover board. (highly commended) gives a convenient method of holding down the edges of the quilt by folding slips turning back on hinges. The floorboard is reversible and the hive well made. The Myrtle hive has a very admirable method for hinging the super case, nive has a very admirable method for hinging the super case, which stops when standing at right angles to its shut position, while the cover can be lifted off if desired and returned to its hinged position in a moment. Mr. Jas. Lee (highly commended)—his dummy is new and convenient. Mr. Thorn (highly commended)—good hive, sensibly arranged in two body boxes, both to carry frames and sections.

Mr. Watson shows a curious hive, with semicircular frames far too small to be of any real value. The comb space is not very much greater than half that of the Woodbury. It carries novel

too small to be of any real value. The comb space is not very much greater than half that of the Woodbury. It carries novel supers made of rings of earthenware. These are pretty when filled, but ought to be carefully jacketed to secure warmth. Mr. Martin exhibits a new adaptation of the Stewarton slide, which is made to run in the hive sides, giving admission to lateral boxes.

An Everett extractor with A. J. Root's gearing attracted much attention. Here the honey passes through a strainer before it reaches the tap beneath. It is accompanied by an uncapping reaches the tap beneath. It is accompanied by an uncapping knife with thick blade bevelled towards each edge, so as to prevent the drag occasioned by a large surface of metal touching the comb. This knife should be remembered by all about to buy an extractor. Mr. Newman, the courteous Editor of the "American Bee Journal," is a visitor with us. He addressed in inspiriting and eloquent terms one of the gatherings in the manipulating tent on Friday, his remarks meeting with a hearty response. whole Exhibition has been amongst the most popular with visitors of any of the many things Kilburn has had of late to show, the manipulations attracting crowds who have not only been sur-prised, we hope, but have been enlightened, and made in many cases the teachers to others of new ideas.

Here I have been constantly plied with questions showing the deep interest taken, while the value of that form of hive which admits of the use of the extractor is beginning to be seen with The bearing clearness, even by those who as yet use skeps only. clearness, even by those who as yet use skeps only. The bearing of the advocates of fixism is in a marked manner changed from that which I remember at the first Crystal Palace Show. The determination of the Committee to close on Monday, according to the original programme, was heard with regret by those high in authority at Kilburn, who thus give testimony to the great attractiveness of this section of the Exhibition. On Saturday Royalty again honoured us. H.R.H. the Duke of Cambridge, accompanied by the Duke of Sutherland, Countess of Yarborough, and several other notabilities made an inspection. lingering while and several other notabilities made an inspection, lingering while explanations were given of the salient points. The Committee explanations were given of the salient points. The Committee are now making arrangements for increasing the educational value of the tent manipulations at Kensington on the 22nd, 23rd, and

24th inst .- F. CHESHIRE, Avenue House, Acton, W.

WAX IMPRESSED SHEETS—SWARMING IN 1879.

I HEARTILY thank your correspondent "J. S." (page 489) for his lucid remarks upon my tentative experiments with the impressed wax sheets. The record of my failures and disappointments will not have been written in vain if his experience shall be a guide to others in a like predicament. Since I wrote, and before seeing his remarks, I had adopted his method of affixing the comb as guides along the bars to the depth of an inch or more in the case of a recently constructed laterally expanding hive, which I hope to people to-morrow with a large expected swarm.

Talking of swarms leads me to observe that swarming this year

is both unusually late, as indeed was to be expected, and in my case has been attended with the loss of the queen on two occasions, when the prime swarms went off in the midst of a strong gale of wind. I am now waiting for the issue of two second swarms, which ought to be enormous if they do not divide. Observing this tendency, and fearing the loss of a valuable imported queen, I made a swarm artificially the other day by simply transferring a couple of frames containing some half-dozen tenanted royal cells into an empty bar-framed hive and putting it in the parent hive's place. They appear to be doing well, so far at least as the wretched weather will allow them. The parent stock is quietly removing a lot of drone grubs, the heads of which were sliced off before replacing the combs. Not one of my swarms has issued in fine weather. On every occasion the weather has been most unsutable, but the poor insects appear to have lost patience and resolved to avail themselves of the first gleam of sunshine.

Since I wrote the foregoing one of the two expected second swarms has issued, but again in a gale of wind, and again with the same result—the loss of its queen and the return of the swarm to the hive. This same swarm issued again on the 30th after an interval of two days, during a gleam of hot sunshine in the midst

of thunder showers. It settled all right on an espalier, but too must have taken wing in the act of being hived and returned to the old home, as the bees all returned there in the course of an hour or two. How they manage to live is a mystery, as no honey is visible in any cells from the windows, and the weather continues to keep the bees idle at home.

We amused ourselves after the event last mentioned by examining and re-arranging the combs in the swarms of June 15th and 24th, after our new lights as to the use of impressed sheets. Some of the whole combs had sagged, as was to have been expected. These were trimmed or removed, and properly arranged combs introduced. Not a particle of sealed honey could be seen in either of these hives, and scarcely any in the open cells.—B. & W.

OUR LETTER BOX.

BRAHMA DORKINGS (M. B.).—If you wish the progeny to be dark have both parents dark; if you wish for light-coloured birds have both parents light-coloured.

PHEASANT CHICKS (Heywood).—They hatch in the same time as the domestic fowl and require the same treatment. Consult our "Poultry Book."

Doth parents data, "Proceedings of the same time as the domestic fowl and require the same treatment. Consult our "Poultry Book." DEATH OF DUCK (Capt. Jackson).—Death was caused by some poison. Wild Ducks often frequent salt marshes.

BEES IN WOODBURY HIVE (W. B. C.).—From your account it seems probable that your bees have partially descended into the Woodbury; but why not lift off the straw skep and see? We doubt, however, whether they will make that their permanent dwelling if left as they are, seeing that the mass of comb is in the skep. If the weather is as bad with you as it has the has been with us we should be disposed at once to transfer the combs of the skep to the Woodbury bar-frames, as there is hardly any breeding going on and no honey in any quantity to trouble the operator. Doubtless we shall have something of a glut of honey towards the middle or end of the month. STEWARION BOXES—FAILURES IN HIVING (A Constant Reader).—Our Scotch friend to whom we referred your case says, "Your correspondent seems to have acted according to instructions quite right. The failure seems to me to have resulted from uniting a second swarm with a virgin queen and disproportionate numbers when no honey was abounding, instead of a first swarm when honey was abounding. Both swarms should be sufficed with honey when united."

Supposing that all was rightly done

queen and disproportionate numbers when no honey was abounding, instead of a first swarm when honey was abounding. Both swarms should be sufficed with honey when united." Supposing that all was rightly done according to instructions we are inclined to think that the second swarm added (whether prime swarm or cast) was in a state of semi-starvation. Bees will not welcome new comers unless they have an extra good sackful of honey, as they always have in ordinary seasons when swarming. This it is which makes bees weigh so heavily in the awarm. But it is quite impossible to say certainly why or how you failed so lamentably. Any incantious knock or jar to either hive would be enough to excite angry feelings, and to make them receive the new comers with more than suspicion as they would

knock or jar to either hive would be enough to excite angry feelings, and to make them receive the new comers with more than suspicion, as they would naturally attribute the disturbance caused by the jar (which to them would be as an earthquake to us) to the fresh arrivals. Then, bees are capricloss creatures, and can never be trusted to act according to rule.

BEES CARRYING OUT DRONES (Apis).—Your bees are in despair. They see no signs of summer coming; and so, believing it to be postponed for a twelvemonth, they are naturally getting rid of all supernumeraries and making preparation for a hard winter with a scarcity of food. You may make an artificial swarm, but with only one hive it is a risky thing, unless you can examine it and see whether there are any forward royal cells. If you do, mind you feed both hives should the weather not improve. You do not say whether your hive has frames or not.

THE PLEASURES AND BENEFITS OF HORTICULTURE—FRUIT PROSPECTS.

LTHOUGH an amateur only, I have for several years past looked forward with pleasure to Thursday, the day which brings me another number of the Journal of Horticulture, and extends my acquaintance with those writers, although knowing them through their writings only, I can hardly avoid expressing my gratitude. Whilst in the active practice of my

profession one of my chief recreations was to devote a few minutes daily to Grapes, flowers, and orchardhouse trees. Although the minutes were short and snatched from graver work, still, by following a system, they sufficed. To take to the bedside oneself a tempting bunch of Grapes, a juicy Peach, or even a few flowers—to minister in some way or other to the comfort of the feverish or languid patient, is a luxury which medical men have peculiarly the privilege of enjoying. In all this I derived great help from the Journal of Horticulture; and I believe that many of my medical brethren, both the hard-worked and the over-worked, might be made happier and healthier by giving a few moments on each day or in each week to the perusal of its pages. Few things will prove better to

unbend the mind and furnish a new train of pleasant thoughts

than the cultivation of a garden. Nor is it difficult to acquire very soon as much knowledge as to kindle an active interest to know more. The writers to whom I refer are so clear, often so graphic, so bent on saying all that they know on a subject, recounting their failures as well as their successes, that any person with a trained intelligence and a love of knowledge may in a short time put what he has learned in practice. Their candour indeed has often reminded me of a leading principle in my own profession-to have no secrets, but to impart everything in the shape of knowledge for the general good. For as knowledge is the result of the combined experience of many minds in all times, so it is the duty of those who have received of the common stock that they should be ready in their turn to give also. None of the writers in question convey more in a few words, I think, than Mr. William Taylor; and it is the terse narrative of the fruit prospects under his own eye in the Journal of the 3rd inst. that has tempted me to follow him, however humbly, by saying what has happened to me.

I ought to state that my garden is on the southern slope of a Surrey hill, looking down upon the broad weald of Sussex. It is at least 500 feet above the sea, and is fairly protected by higher ground on the north, east, and west, but not to an extent to deprive it of the full advantage of sunshine (at least when there is such a thing) all day long. It is to some extent, but not completely, shielded from the southwest winds, which traverse probably over thirty miles between the sea and us. The soil is a deepish loam resting chiefly on clay, but in a few parts on sand. Besides being on a slope, it is drained artificially.

In this garden four years ago about 250 bearing trees No. 866.—VOL XXXVII., NEW SERIES.

of Apples, Pears, Plums, and Cherries were planted. They are mostly pyramids and bushes; but there are several on walls, some espaliers and a few standards. They have mostly grown freely and give proof that the soil suits the majority. Last year a considerable number bore fruit well. This year the crop will be an almost complete failure. The Apples and Pears blossomed well, but under the influence of the long, cold, wet, sunless spring the fruit did not set, or it dropped off in its earliest stage.

Among Pears Louise Bonne of Jersey, Winter Nelis, and Souvenir du Congrès have fared best out of thirty or forty different varieties. Of the first I have seven trees; two on walls, the others pyramids. They have all a moderate crop, and one on a west wall a full crop. Winter Nelis on an east wall has a good crop, whilst of several pyramids most have some fruit. A pyramid of Souvenir du Congrès bears a heavy crop, and several bushes of Joséphine de Malines and Knight's Monarch have a sprinkling of fruit. Several of the fruitless trees, notably Marie Louise, have their leaves, either wholly or in round spots, blackened as if scorched. The pyramids of this variety, which blossomed well and looked promising, have lost their fruit, and many of the younger branches are black and shrunken, with withered leaves still clinging to them. On a west wall a tree, although it has lost its fruit, does not look unhealthy.

Of a considerable variety of Cherries a Morello on a north aspect and a Governor Wood and May Duke on a west aspect promise fruit. Of the others, several blossomed well, but most of the fruit has lately fallen off. The Plums, which look healthy and vigorous, have an insignificant crop of fruit. Victoria, Coe's Golden Drop, and Belgian Purple are the best. The different kind of Gage mostly blossomed well, but the fruit has all fallen. I may add that bull-finches, owing to the slowness with which the buds unfolded, had an opportunity this spring of doing more mischief than usual.

Apples have, perhaps, more signally failed than other trees, athough the display of blossom was superb. In addition to the smaller trees in the garden there are about forty full-grown standard trees around the grass fields. Of these a White Heart Cherry and several Plums, prolific last season, are fraitless this. Two huge perry Pears have good creps; they blossomed well, and one of my men, whe has known them for years, says that whenever they do this they bear fruit. The remainder are Apples, which are mostly without fruit; but one or two bearing local names have great crops. Of three Apricots trees, the varieties the Moorpark and Peach, on walls, two are dying fast as Apricots often do; the other a large tree, which looked healthy in the beginning of the season, seems inclined to follow their example. Gooseberries and Currants are heavily laden with fruit.

In striking contrast to most of this is our unheated orchard house, where the trees are weighed down with choice fruit, and where for a fortnight past we have been gathering Strawberries of huge size and good flavour. In fact a thin screen of glass is all that separates exuberant fruitfulness within and utter barrenness without. A dry genial air is on one side, chilly dampness on the other, and

NO. 1607.-VOL. LXII., OLD SERIES.

yet the treatment and the soil are the same without as within. I will send a brief account of this orchard house for a future number.-A SURREY PHYSICIAN.

THE POET COWPER AS A GARDENER.

IT does not appear that any one of the biographers of Cowper has given due prominence to the love of gardening which was so noticeable in his character. Moreover, much might be said, were it relevant here, upon the beneficial influence that his gardening pursuits had upon the oft-distressed poet in soothing his nervous irritation and banishing, for the time at least, his mental perplexities. Had it not been for these we might never have had some of his sweetest verse. In a letter to Mr. King written at the age of fifty-seven he remarks confidentially, "Gardening was of all employments that in which I succeeded best, though even in this I did not suddenly attain perfection. I began with Lettuces and Cauliflowers; from them I proceeded to Cucumbers, next to Melons. I then purchased an Orange tree, to which in due time I added two or three Myrtles. These served me day and night for employment during a whole severe winter. To defend them from the frost in a situation that exposed them to its severity cost me much ingenuity and much attendance. I contrived to give them a fire heat, and I have waded night after night through the snow, with the bellows under my arm, just before going to bed, to give the latest possible puff to the embers lest the frost should seize them before morning. Very minute beginnings have sometimes important consequences. From nursing two or three little evergreens I became ambitious of a greenhouse, and accordingly built one, which, verse excepted, afforded me amusement for a longer time than any expedient of all the many to which I have fled for refuge."

From various references in his poems and letters he evidently cultivated a variety of flowers both in this greenhouse and in the open borders of his Olney garden, and sundry allusions imply that he also nurtured wall fruit; see the "Task,"

book iii., the passage commencing-

"Proud of his well-spread walls, he views his trees,
That meet (no barren interval between)
With pleasure more than even their fruits afford,
Which, save himself who trains them, none can feel.
These therefore are his own peculiar charge;
No meaner hand may discipline the shoots,
None hand have approach them." None but his steel approach them.

The same poem contains a very minute description of the method of growing Cucumbers pursued by him; but although he could produce Cucumbers he could not eat them, as he remarks humorously. One transmitted to his friend Newton furnished a riddle for the amusement of both—"I send a Cucumber, not of my own raising, and yet raised by me." As he subsequently explained, he had reared some Cucumber plants from seed, and one of the Cucumbers produced he had given to a gardener at Tyringham. He had sowed the seeds, and one of his plants bore the Cucumber which Cowper had sent to Newton; so that the poet argued he had in one sense raised the Cucumber, because he had reared its pro-genitor, though the actual parent had been grown in another

garden.

A propos of Cowper's greenhouse, we must remember it is not identical with the little place he calls his summer house, and in which he wrote many of his poems; but he and Mrs. Unwin did sometimes sit in the greenhouse, when the plants were put out during the summer season, the glass being shaded with mats. In one letter he depreciates this greenhouse, calling it an affair which Lord Bute's gardener might put upon his back and walk away with, in which remark must be somewhat of poetical exaggeration. In a letter to Mr. Bull, of 1783, Cowper says, "Our greenhouse is a cabinet of perfumes. It is at this moment fringed with Carnations and Balsams, with Mignonette and Roses, with Jessamine and Woodbine, and wants nothing but your pipe to make it truly Arabian! And in the "Task" he has recapitulated a number of other m use 1888. He has recapitulated a number of other species, which it may be presumed he had grown, but there is some difficulty in identifying several of the plants named. (See book iii, "The Garden.) His "Amonum," Professor Williamson suggests, may have been Myrtus Pimenta; his "spangled Bean Ficodes" the Mesembryanthemum crystalliams. num. Occasionally his botany was at fault, as when he designated Poplars "Elms" in one of the books of the "Task," a subject on which he was frequently joked by his friend the younger Throgmorton. And we have slight doubts concern-

ing the true appellation of the plants introduced in his account of a suburban garden-

"A garden in which nothing thrives has charms
That soothe its rich possessor; much consoled
That here and there some sprigs of mournful Mint,
Of Nightshade, or Valerian grows, tho' well
He cultivates."

Cowper also took a special interest in the cultivation of the Pine Apple. A little incident connected with the visits paid by the bees to his frame led to his writing one of his wellknown shorter poems. He tells Unwin, September 21st, 1779, that he had himself glazed the two frames destined to receive the plants he was expecting from Jamaica, and he appears to have given seeds or plants to Mr. Wright, gardener to Lord Dartmouth. From a remark in a letter to Mr. Hill we gather that he had applied heat to his plants by means of bark, as was then commonly done, but he found in experiment that "leaves gathered at the fall hold their heat much longer than bark, and are preferable in every respect. For Myrtles he evidently had a particular regard; his letters allude to his having purchased them in Covent Garden when he was a law student, and to his friend Newton he gives exact cultural directions—the plants were to be watered in summer every other day, in winter twice a week. At Michaelmas he advises repotting with fresh earth, and once in two years that the matted roots be pared with a sharp knife. To Cowper it was a high gratification to visit the splendid gardens of some of his wealthy neighbours, and it was one of the inducements to remove to Merton that he was brought nearer the grounds of his friends the Throgmortons at the Park. We may add that there are still sold in Olney plants and seeds which are presumed to be descendants from those cultivated by the gentle poet.—J. B. S. C.

FRUIT PROSPECTS.

I AM very much afraid that those who recently took a sanguine view of the fruit crops are doomed to disappointment. I have this week personally and carefully examined three large gardens, and also made inquiries of competent persons concerning other gardens, and I sincerely hope that this part of England (and I live almost in the Bath district), one famous for fruit, is the exception to the rest. We have had as yet but one summer day—namely, June 13th. Up to the time I write (July 5th) intensely heavy storms, some lasting for many hours, have been constant; the rain pouring at times so heavily that spouts, shoots, and drains failed to carry it off. The ground is saturated, the roads such as are usually seen during a wet winter. My bedding plants are not growing, not even the Geraniums flowering.

But to come to fruit. The Pear crop is next to nothing, and the strong gales have sorely beaten the trees about. I should observe also that the temperature has been very low; on July 1st it was down to 41°. Fancy this in proverbially sultry July! Passing from Pears I come to something much more serious—the loss of the Apple crop. Espaliers are the worst, probably from being shaped so as to catch the rain on both sides. The blossoms became brown, and as Wiltshire people say, they are "gone all of a scrump." Standard trees have an extremely poor crop, as these trees from their height have caught the winds so much, and besides they are heavily blighted. I have looked up through trees which are sparsely covered with leaves as if it were late in the autumn; the leaves

are on the ground black and curled.

As to pyramids, the form in which I chiefly grow Apples, the leaves are as yet fairly good. As to fruit, the only tree on which I have a heavy crop, and as yet doing well, is Stirling Castle, an excellent Apple from blossom to eating, even very handsome in shape when quite small. The next best is Irish Peach, which holds its crop well, and the Apples are growing; Margaret a fair crop, Emperor Alexander just a few, Summer Golden Pippin fewer. I should observe, too, that Glamis Castle, Cellini, and especially Ecklinville Seedling, are holding their partial crop very well; Joanneting nil, Lord Suffield nil. Here I would observe that we must not part with old friends too readily. I have a Keswick Codlin growing close to Lord Suffield, both the same age, the former fairly cropped, the two latter not bearing a single Apple; they blossomed well, but the wet and cold have utterly destroyed all; there are the blossoms "all of a scrump"—mere wet brown bunches.

It is well to notice how badly or, on the contrary, how comparatively well, certain Apples bear a cold wet season. Lord Suffield is the worst I have, Duchess of Oldenburg fair only, Cox's Orange Pippin bad, and even that grand kitchen Apple New Hawthornden holds on a very small number of Apples, though the tree is perfectly healthy in leaf and wood. Golden Pippin nothing, Sturmer Pippin the same; Dumelow's Seedling, a few on one tree none on another. Even the old Hawthornden has but very few. I have two standard trees of Lewis's Incomparable which are miserable blighted failures—trees from which in ordinary years I have gathered many bushels. Pomeroy even worse. I have not reckoned many trees of last year and the year before's planting, from the former of which I expected nothing and—I have got it.

I pass on to Plums. All the better and choicer kinds, such as Green Gage, Coe's Golden Drop, and Ickworth Impératrice, are complete failures. The coarser and common kitchen

I pass on to Plums. All the better and choicer kinds, such as Green Gage, Coe's Golden Drop, and Ickworth Impératrice, are complete failures. The coarser and common kitchen Plums stand better. As yet my best cropped trees are Damsons. a Bullace, and a coarse egg-shaped Plum, name unknown, Cherries appear to be better, particularly on walls. Currants plentiful, and also Raspberries, and I hear no complaint about Strawberries; but I expect great disappointment in all if this cold and wet weather continues. Gooseberries, where the bull-

finches have been shot, are a capital crop.

Fruit-growers have feared May frosts. This May there were not any, but a low temperature, much wind, and much rain have proved worse foes than spring frosts. Of Potatoes, save in frames, there are not any as yet. I hope and trust that fruit-growers in the midlands and south of England will be able to give a better account than I can who live in the west. A gardener—a jobbing man—who therefore sees a great many gardens, tells me that as a rule the only good crops of Apples are the early eating varieties, and that all the late Apples, of course the most important, are gone. Leaf blister abounds on the wall trees unprotected by glass. Peaches, Nectarines, and Apricots are conspicuous by their absence.—Wilterhire Rector.

THE fruit prospects in Gloucestershire under the influence of the ungenial weather that we have experienced since I last wrote have not improved; they have, in fact, rather gone back than otherwise. Rain fell on twenty-three days in June and for the first nine days in July. Some of the Apple bloom which appeared perfectly set has dropped off the trees, and some of the Plums being unable to grow have turned yellow and will not come to anything. There is yet time for a good crop of Strawberries and Raspberries, but more sun is urgently needed to ripen the crop. I gathered the first Strawberry July 5th, a month later than in some seasons. Potatoes on the dry land here are looking well in the top, but they are unusually late, and in the majority of cases not fit to dig at the time I write, and as the old ones are gone the poor people are at present without any. I fortunately have some of the old original Ashleaf, and I find them very useful this season as they are now of a good size. I do not share the opinion of your Welsh correspondent as to the fear of much disease this year; the weather has not been warm enough for the fungus, and in 1860, a season which this up to the present time very much resembles, there was not very much loss by the disease.

There is one point to which I should like to draw the attention

There is one point to which I should like to draw the attention to your readers, and that is the necessity in the present cold backward season of getting out the Broccoli and winter greens, sc., as soon as possible, or they may not do much good. I am planting between the Potatoes in every other row. The tops are turned back over the unplanted rows so as not to interfere with the plants by shading them too much.—AMATEUR, Circucster.

CAMELLIAS AND AZALEAS.

THE practice of placing Camellias outdoors after the buds are set is not a commendable one, as the foliage is liable to suffer miless the plants occupy a position partially shaded from the sun. The buds also not unfrequently drop, owing to the loss of roots caused by drought or by the soil being saturated by late summer rains. A cool airy house is more suitable to them after the buds are set, with just sufficient shade to protect them from strong sunshine. Plants for early flowering that have set the buds and are of considerable size may be placed in a house with a north aspect, or at the back of a north wall; for though all attempts at retarding the buds will be futile if they get too forward for the time the flowers are required, yet they will come on more slowly in such positions than in more favourable aspects. It should also be borne in mind that if

flowers are required early in the autumn they can only be obtained by correspondingly early growth, and the plants must be brought on gradually, as anything approaching to forcing in the later stages will only end in the buds dropping. Plants that have completed their growth must not be retained in moist heat, or they will start into a second growth. Less supplies of water will be necessary now, yet there must not be at any time any deficiency.

Axaleas that have set their buds should, after being removed to a cooler house for a short time, be placed outdoors on the north side of a wall for a few days or in a shady position, so as to prevent the leaves from becoming brown. Later plants should, as soon as the growth is complete, be removed to cooler quarters if they have been placed in warm shaded houses to make growth, and when the buds are set place the plants outdoors. The plants that flowered latest should have the growth encouraged by keeping the house close and moist, affording slight shade from bright sun, and at the same time keep the plants near to the glass, as the more light the leaves are exposed to during their formation the stronger their texture, the stouter the wood, and consequently the buds and trusses of bloom. Afford no more shade than may be necessary to prevent scorching. Freedom from insects—i.e., thrips and red spider, and plenty of light during the season of growth, are essential to success in Azalea culture, as when the leaves are thin in texture they frequently fall in winter, and the flowers are not only small but badly coloured.—An Old Grower.

EFFECTS OF THE WINTER.

It may possibly interest some of the readers of our Journal to hear that the following plants withstood the last severe winter without any protection whatever at an elevation of 230 feet above the sea.

Primula japonica in the coldest place in the garden is (July 8th) 2 feet high, and has four whorls of seed surmounted by one of flowers. Cyrtomium falcatum from Japan is much browned and its young fronds are growing sparingly, but C. Fortunei, which I used to consider the more tender of the two, has many young fronds 24 inches in height, and one plant, though not so tall, has eighteen of this year's growth. Lastrea opaca (Japan) is growing, and last year's fronds are fresh and green, and the same may be said of Selaginella denticulata. Cystopteris bulbifera (North America) is also shooting up. The next were protected by a cloche and are doing well. Doodia aspera (New South Wales), Onychium lucidum (Nepsul), Woodwardia radicans (Madeira), Adiantum Capillus-Veneris from Portland, and Polypodium Phymatodes peltideum. I shall be glad if some of your readers will kindly give lists of exotic Ferns which they have found to be as hardy as these above.—C. T. H., Osmington, Weymouth.

BLOOM ON GRAPES-RED SPIDER-SYRINGING.

A RECENT writer in the Journal gives directions how to secure a heavy coat of untarnished bloom on Grapes, and he lays especial stress on abstaining from the use of the syringe as a means to secure the desired end. As we look at the matter, and we do so in the light of experience, the writer of the article in question only touches the surface of the subject. We fear that were the directions on page 1 carried out good-coloured Grapes with a heavy coat of untarnished bloom would in a season or two disappear from the land. Good colouring and bloom depend, in our opinion, on the health of the plants and the regulation of atmospheric temperature according to the intensity of the sun's rays. Without syringing, or some other process equally fatal to colour and bloom, red spider is sure to put in an appearance, and when spider gains and keeps possession of the field farewell to vigorous growth, fine colour, and heavy bloom; at least such has been our experience in the past, and even in this year, with rain in great abundance all through the months of April, May, and June, our old enemy has shown front We did not syringe when there were no spiders to dash off and destroy. We did not fire until the Zulus of the vinery appeared; but with the first appearance of spider we went for pail and syringe at once, and began. This was when the earliest bunches were almost finished, and just when we be-lieve syringing is generally not attempted. But we did not syringe the bunches, but dodged this way and that, so that a tolerably forcible stream of water could be directed full dash against the enemy's stronghold—the backs of the infected leaves, without touching the bunches. A few drops fell on the

bunches, which we could not help; but they did the bloom little harm, as they shot off the berries as if from a duck's spears again. When the syringing is properly done it is the most effectual, economical, and cleanly of all modes of eradicating red spider, and in good hands the bloom of the bunches is telerably safe.

We have become accustomed to read that red spider will not appear if the borders be kept properly moistened. We are quite aware that a dry border and debilitated trees favour the appearance and rapid propagation of the pest, but as we are very particular in having our inside border regularly and thoroughly moistened, and as our Vines are in exuberant health and properly cleansed when pruned in winter, and situated in a cold wet district, and as the spider appears regularly (just when the Grapes colour), we do not hesitate to pronounce such views groundless. Sponging the leaves we have no time for; sulphur painted on the pipes is, either as a preventive or a check, anything but effectual. The judicious use of the syringe we find an invaluable help, and by its assistance we keep the Vines in vigorous health, and we manage to produce Grapes which are large in bunch, large in berry, well coloured, and covered with a good coat of untarnished bloom.—SINGLE-HANDED.

THE NEWCASTLE SUMMER SHOW.

JULY 9TH AND 10TH.

THE unpropitious state of the weather on the morning of the Show did not have the effect of inspiring the ardent and enthasiastic officials of the Society with that amount of confidence which their unflagging exertions deserved. Never perhaps has any horticultural society made such rapid strides as this one in so short a time. It is not many years since the prize money of the Society was only £30 a year, and this year it amounts to about £710. This success is no doubt the result of an unanimity of effort which exists amongst the Committee in furtherance of the interests of the Society, this Committee being principally composed of practical business men, who are thorough masters of finance and adepts at "raising the wind." Messrs. Taylor and French are no longer Honorary Secretaries, but still give their valuable services to the Society, and with Mr. Gillespie, the acting Secretary, form a trio of experienced workers which are deserving of great praise. Towards noon on the first day the weather cleared, and kept clear till the evening, when rain fell rather heavily, which marred the pleasure of the visitors, as the Society had provided a rich treat by illuminating the Exhibition. The second day was much better, and towards evening the Society were taking at the rate of £100 per hour at the nominal charge of 6d.; the efforts of the directorate may therefore be said to have been most successful. the Society was only £30 a year, and this year it amounts to about £710. This success is no doubt the result of an unanimity been most successful.

Referring now to the Show. It has certainly been the best the Society has ever held. Many of the products possessed superior merit, and the prizes were in nearly all cases severely contested for. Roses and fruit were not strongly represented, the latter especially. Grapes were deficient in colour and quality, the result of almost the entire absence of sun and the extraordinary late season. Not so with the queen of flowers—the Rose, which although sparsely shown was represented by blooms of great excellence, and it was declared by good rosarians that better Roses were never exhibited at Newcastle than those staged by Messrs.

Granston & Co. Leazes Park was the site of the Exhibition, and the Show was Leases Park was the site of the Exhibition, and the Show was hield in a series of tents, forming a large reotangular marquee of 150 feet long by 130 feet wide, which allowed plenty of room for staging the plants with effect, and also for the throngs of visitors to inspect everything satisfactorily. There was also a large circular entrance marquee, which was well filled with several large collections of plants. Eighty-three exhibitors entered the lists, representing 1880 plants out flowers the

lections of plants. Eighty-three exhibitors entered the lists, representing 1889 plants, cut flowers, &c.

PLANTS.—The silver cup, value £15, presented by Col. Jolosy for eight plants in bloom, was deservedly won by Mr. Tudgey, gardener to J. F. G. Williams, Esq., Henwick-Grange. This prize brought out eleven competitors, the number of plants being wisely reduced this year from twenty to eight. The first-prize collection contained Erica Candolleana, E. tricolor Barnesi, E. tricolor speciosa, and E. mutabilis, the latter almost scarlet; Dracophyllum gracile, Allamanda nobilis, Glerodendron Balfourianum, and Anthurium Schertzerianum with spathes fully 5 inches long. Mr. Noble of Woodburn was placed second, his best specimens being Genetyllis fuchsioides, Clerodendron Balfourianum, Erica perspicua nana (fine but rather faded), and Dracophyllum gracile. Mr. Thompson of Ravenside Nurseries, Newcastle, was third, his prominent plant being Allamanda Schotti. In the corresponding class of six plants, open to all except nurserymen, there were six class of six plants, open to all except nurserymen, there were six competitors. Mr. Tudgey was again first, the prize being £6 and the Banksian medal, his best plants were Dracophyllum gracile,

Pimeles mirabilis, Anthurium Schertzerianum, and Erica Cavendishiana; Mr. Hammond, gardener to Sir Wilfrid Lawson, Bray-ton, near Carlisle, was second with good plants, especially of Dra-cophyllum gracile and Anthurium Schertzerianum; Mr. Clarken, gardener to Mr. Hedley West, Chirton House, was third, his notable plant being an excellently flowered Bougainvilles glabra. Six

competitors.

For eight foliage plants a silver cup, value ten guiness, was given by Col. Joicey. Mr. Hammond was here an excellent first with a splendid Cycas revoluta showing fruit; Croton Vetchii, C. Weismanni, and C. majesticus were remarkably fine; Demonorops fissus, Dasyltinon glaucum, Kentia Belmoreana, and Yucas Childhii. norops fissus, Dasylirion glaucum, Kentia Belmoreans, and Yucsa aloifolia variegata, all excellent. Mr. Methven, gardener to T. Lange, Esq., Heathfield House, was second. His best plants were Dicksonia antarotica, Oyeas revoluta, a good Crotea, and Encephalartos. Mr. Noble and Mr. Tudgey were third and fourth. In the class for six foliage plants there were six entries. Mr. Hammond was again first with a splendid Cocos Weddellians, Phyllotænium Lindeni, Crotons Johannis, undulatus, and majssticus, and Chamærops Fortunei. Mr. Lazenby, gardener to Ms. Gurney Pease, Woodside, Darlington, was second, and Mr. Tudgey third; both staged good collections.

Pelargoniums were magnificent, and deservedly admired. Fw.

third; both staged good collections.

Pelargoniums were magnificent, and deservedly admired. For nine Show varieties the first prize was £9. This was won by Mr. May of Bedale, Yorkshire, with beautifully trained and well-flowered specimens of Ruth, Prince Leopold, Claribel, Floribank, Queen of Whites, and Emperor. Mr. Lazenby of York was seemed with plants more open and not so profusely flowered; Mr. Robisson, gardener to Mr. Cochrane, Oakfield, being third with mash smaller plants, but fresh. For six plants Mr. Sanderson, gardener to Mr. Parker, The Elms, Usworth, was first with fresh and good examples of Formosa (splendid); Rose Celestial, Virgin Queen, British Tar, &o.; Mr. Adams, Swalwell, being a close second with good plants.

good plants.

In the class for six Fancies Mr. May and Mr. Lazenby occupied the same places as before, the latter having much smaller plants; and in the corresponding class for three Fancies Mr. Adam was the only exhibitor, staging fresh but small plants. 147 plants were staged in the above classes, and the display was an imposing

Bedding plants were very good. Messrs. Lexenby & Sons, York, were first with fine examples of Geranium Vesuvius, Mrs. Pollock, and Violet Hill Nosegay, Verbena Purple King, Viola Perfection, &c. Three collections were shown. Alpine plants were also excellent, Mr. Rodwell, North Eastern Cottage, York, being first; the noticeable plants being Sedam glanuum gwiscerium Senter. the noticeable plants being Sedum glaucum variegatum, Sempervivum Aitoni, Sedum spectabile var., and Sempervivum arachnoideum. Mr. Whiting and Mr. Larke followed, the former with Kleinia repens, Sedum reflexum, and Roheveria sanguines in face condition.

FERRS.—In the class of six exotic Ferras, distinct, there were exhibitors. Mr. Tudgey was first, Mr. Hammond and Mr. Noble following in the order named. The first-prize collection contained Gleichenias Mendeli and dichotoma; Adiantums canatum, gracillimum, and tenerum. Mr. Hammond's group contained fine plants of Adiantum pedatum, Asplenium coriaceum, a good Davallia Mooreana, Dicksonia antarctica, &c. Mr. Noble's bet plants were Gleichenia speluncæ and Adiantum trapeziforme.

plants were Gleichenia spelunces and Adiantum trapeziforme. For six British Ferns, distinct, there were four entries, Mr. Noble being first with Trichomanes radicans, Polystichem angles grandidens and proliferum, Lastres Filix-mas, Osmunda negative cristata, and Scolopendrium crispum. Mr. Rodwell was seemed with much larger plants, and we think equal as regands varieties. Roses in pots were not numerous, but one hundred plants sent by Mr. May of Bedale added considerably to the attractions of the Show. Mr. May was the only prizetaker in the class for six Roses, distinct, in pots, with Capitaine Christy, Mons. Riemse Levet, Princess Mary of Cambridge, Dupuy-Jamain, Madame Lacharme, and Paul Verdier.

Only two lots of Ericas were shown, and the plants were rather

Only two lots of Ericas were shown, and the plants were rather small. There is nothing further to mention among the plants except some good Fuchsias from Mr. Forsyth and the table plants, of which eleven lots were shown; Mr. Lazenby being first with fresh medium-sized examples of Groben Weismenni, Aralia leptophylla, A. Veitchii, and A. Veitchii graeillima, Pandanus Veitchii, and Dracsma gracilis. Mr. Thompson, gardener to Lindsay Wood, Saq., South Hill, was second with Dracsma Guilfoylei, Reidis glaucescens, Cocos Weddelliana, &c. Mr. Whiting was third.

ROSES.—For forty-eight Roses, not less than twenty-four varieties, only two competitors entered the lists, Messrs. Cranston and Co. and Mr. May, and for thirty-eix the same, and they seemed the prizes in the order of their names. Messrs. Cranston's blooms were exceedingly fine and well coloured. Their best flowers were Prince Camille de Rohan, Maurice Bernardin, Ferdimand de Lesses, Duke of Edinburgh, Général Jacqueminot, very fine; Mons. E. J. Only two lots of Ericas were shown, and the plants were rather

Prince Camille de Rohan, Maurice Bernardin, Ferdinand de Lesses, Duke of Edinburgh, Général Jacqueminot, very fine; Mons. E. Teas, Horace Vernet, Madame E. Levet, Auguste Neumann, Magna Charta, Duchesse de Vallombrosa, Mdlle, Marie Cointet, Oxonian, and Catherine Bell. Mr. May also staged some fine flowers of Capitaine Christy, Madame Victor Verdier, François Michelon, Charles Lefebvre, Mons. Etienne Levet, and Mons. Etienne Dupuy.

For twelve yellow-Reses Messus Mack & Son, Catterick Bridge, were first; for twelve Roses of one sort Messus. Cranston were first with Marguerite de St. Amand. For twelve Tea-scented Roses Messus. Mack and Cranston secured the prizes, the former staging fine, blooms of Madamas Bravy and Madame Berard; the second Cheshaut Hybrid, Marie Van Houtte, and Devoniensis.

In the class for thirty-six Roses, open to all except nurserymen and dealers in flowers, Mr. Jowitt, The Old Weir, Hereford, was first for Messrs. Cranston's ten-guinea challenge cup with a fine collection. Mr. Whitwell of Barton Hall was first for twelve Teascented Roses in not less than six varieties, the blooms being shown on a black silk velvet ground.

In the open class for twelve bunches of cut flowers six collec-

tions were staged, Mr. Tudgey being first with fine flowers of the choicest store and greenhouse plants. For six bunches in the corresponding class, nurserymen excluded, there were seven entries, second with a stand which contained Pelargoniums and Passiforas, while two of the other stands contained choice flowers of Lapageria alba, Ixoras, and Ericas, and were entirely overlooked. Cut flowers of herbaccous plants were magnificent, nine lots being staged. Mr. Battensby was first with a very choice collection. Some excellent flowers were also shown amongst the other contributors by Messrs. Spoor, Larke, Lazenby, &c.

tributors by Mesers. Spoor, Larke, Lazenby, &c. Bouqueta, epergnea, and flower baskets were also largely exhibited. Some were exquisite in taste, whilst others were rather too profuse in colour, the flowers too densely packed and formal, espenially amongst the flower baskets. There were altogether 153 because, epergnes, &c., shown. There were four competitors for the table decembions, the President of the Society giving a for the table decarations, the President of the sourcy giving a cup walus £10, which was deservedly won by his able gardener Mri M. Thompson. His table was exceedingly charte and artistic, the celours well blended, neither too heavy nor too light, and his success was in a great measure due to a judicious draping of the greatful hanging from Lygodium sonders. The centrepiece was a March stand finned by smaller stands, one at each end, with a sufficient number of still smaller glasses all round. The centre stand contained at the base Encharces, Ixoras, and other coloured flowers, fringed with Davallia Mooreans and Adiantum trapezi-forms, while lighter flowers were employed at the top. There forms, while lighter flowers were employed at the top. There were two table plants, Grevilles filicifolia and Aralia Veitchii, and aix dishes of fruit. This table was all that could be desired. Means, Gellender & Sons were second, and Mr. Methyan third.

In the energines of cut flowers Mr. Oliver was first with a very

effective arrangement. In both classes bridal bounds were shown well, Mr. Lazenby and Mr. Rutherford being respectively first in each olam. Hand boundets, button-holes, do., were also numerous, Mesers. Rymer, Whiting, Ison, and Jones being successful in their respective classes.

CESSELIE IN INSIET RESPECTIVE CHARGES.

FRUIT; sa.we have before mentioned, was not of such superior quality as we have seen, yet some excellent dishes were staged. There were only two competitors in the class for six dishes of fruit.—Mr. Jowsey, gardener to Glipin Brown, Esq., Ledbury Park, and. Mm. Clark, gardener to the Marquis of Ripon, Studley Royal; and the prizes were awar!ed in the order of their names. Mr. Jowsey's collection included Black Hamburgh and Buckland Sweetsrates Grapes, even and well coloured; Grosse Mignonia Paraches, Edward Respective and Backland Sweetsrates Grapes, even and well coloured; Grosse Mignonia Sweetwates Grapes, even and well coloured; Grosse Mignonne Peaches, Elwage Nectarines, Brown Ischia Figs, and Read's Scarlet Meten. Men Clarke's contained Black Hamburgh and Golden Champion Grapes, the latter net ripe but splendid bunches; superior Royal George Peaches, a small Queen Pine, fine Castle Kennedy Figs, and a good Colston Basset Melon. Much diversity of opinion-existed as regards the awards, many gardeners thinking they conglet to have been reversed. One Judge may be as good as these; but exhibiters do not always think so; and it is certain these ought to be more than four Judges for a show of such magni-tude as the Newcastle Summer Show has now attained. For a collection of four dishes (Pines excluded) Mr. Jowsey and Mr. Westcoth were the only competitors, Mr. Jowsey having fine Black Hamburgh and Foster's Seedling Grapes, and Boyal George Peaches. Mr. Black Niel of Darlington was, first for a Queen Pine, only two fruits being staged. For one fruit tree in pot Mr. Withsuspoon of the Red Rose Vineries, Chester-le-Street, was first with that fine Pear Beurré de l'Assomption. He also received a cultified commendation for a collection of fruit containing the Irish Peach: Apple; Early Ascot, Crimson Galande, and Early Alfred Peaches; Lord Nepter Nectarine, and Black Imperial Plum.

For four bunches of Grapes not less than two varieties Mesers. Joseph Westcott, and Mayin were the prizewinners in the order named. The first had Buckland Sweetwater, Black Hamburgh, hadragich. The first had Suckland Sweetwater, Black Hamburga, Madragich Court, and Foster's Seedling, all very fine. Mr. West-cots exhibited Waltham Cross, Black Hamburgh, and a small bunch of the Duke of Bucelsugh very fine. For two bunches of white Grappe Mr. Clark was first with Golden Champion; me. Marvin & Son were second with the same variety. two bunshes of black Grapes Mr. Hutchinson, gardener to Mr. Musicus, Whickham Grange, was first with two splendid bunches of Madendald Court. Ms. Hutchinson only possesses two vineries, and inches of quite a young man, but certainly shows some creditable funit. Fire dishes of Peaches were staged, Mr. Clark, Studley Royal, was first with magnificent examples and with a very pretty apricot-coloured variety named Rathripe. There were, also five dishes of Nectarines, Mr. Ellsworthy being first with, fine. examples of Elruge. This exhibitor also was first with a dish of Cherries. Mr. Clark exhibited aplendid dishes of Dr. Hogg and James Veitch Strawberries.

and James vetten Strawberries.

The remaining classes to be noticed are those of the amateurs who do not keep a professional gardener; their produce upon the whole was very creditable. Mr. Adams showed a splendid Erica ferruginea; foliage, flowering plants, and Ferns were also well shown by Messus. Battensby, Adams, Gardner, Deighton, Rodwell, Lundi, Spoor, Martin, &c.

Several stands of plants not for competition were sent by purpose the autrance was recovered for this purpose.

nurserymen, the entrance marquee being reserved for this purpose. Mr. Watson, nurseryman, Fenham, had a charming collection, in-Mr. Watson, nurseryman, Fennam, had a charming collection, including hanging baskets of Ferns, vases suitable for the decoration of balconies, entrance halls, &c. Messrs. Clarke, Carlisle, and Mr. Thompson, Newcastle, exhibited stove plants. Mr. Williams, Upper Holloway, London, had a most charming collection of plants, embracing all the novelties of recent introduction of Palms, Ferns, stove plants, Orchids, &c.: these were much and deservedly admired Messrs Grants of the contributed a feature of the contributed of the Mesers. Stephen Nairn & Sons contributed a fine stand of Pyrethrams, and Messrs. Dickson & Sons of Chester a fine col-

Pyrethrums, and Mesers. Diokson & Sons of Chester a fine collection of hardy Psequies. Mesers. Dinning & Cooke exhibited their system of hot-water apparatus. Mesers. Harrison, Grey Street, Gardner, Turnbull, and Read, systems of ventilating.

An excellent luncheon was served, the President of the Society, Lindsay Wood, Esq., presiding, who was supported by the Mayor of Newcastle, High Sheriff, and the Mayors of the neighbouring boroughs, the Treasurer, J. Gray, Esq., the Committee, Secretary, and their friends, when a pleasant and agreeable hour was spent after the laborious duties of the morning.

ROSES IN 1879.

"Do Roses require sunshine to bring them to maturity!" This is a question which I consider most appropriate at the present time, though I am aware that at first sight it may appear to some most absurd. "Do Roses require sun?" I can. imagine some severe but somewhat captious critic exclaim; imagine some severe but somewhat captious critic exclaim; "Do you want bread and meat? Do you require rest and sleep to enable you to live? If you do, then, of course, Roses require sunshine, or else they will not bloom, or, at least, give fine blooms." Now I must own that any time before this season, any year except 1879, I should have been inclined to agree with him, but this year I am disposed to answer my own question with a decided negative. And for this reason, that I have excellent and to me most convincing reason, that I this very excellent and to me most convincing reason, that I have seen finer Roses this year than I ever remember to have seen. An old adage says, "The proof of the pudding is in the eating thereof," and so I would say, The proof of this assertion is thus afforded by the eyes

Now, in the first place it is necessary to show that Roses this year have up to this time had scarcely any sunshine. I live on the borders of South Devon and Dorset, half of my parish is in one county and half in the other, and I confidently assert that we have not had one hot summer's day yet, and that the nights have really been exceedingly cold. There have been very few nights that I have not had a fire, and the temperature has been more like that of November than of June and July. And yet, as I have said before, I have seen as fine if net finer Roses this year than I have ever seen. "Where?" someons may ask, "At the shows, or at home, or at a friend's house?" I have only been to one show, and that was at the Crystal Palsoe, and I need not repeat my opinion of that Show.

At home I have at this moment the finest La France I ever remember to have seen. But I pin my faith upon what I have seen in a friend's garden, and that friend none other than Mr. Robert N. G. Baker of Heavitree, Exeter. I went on the 8th inst. to Heavitree at his request to help him to stage for the Norwich Rose Show, and although prepared from his success at the shows to see great things, I must own my expectations were more than realised. We staged thirty-six and twenty-four distinct, twelve of Charles Lefebvre and La France. six new Roses, and out also two large boxes of spare blooms, and when we had done we left blooms uncut enough to stage for two more large shows. Without exaggeration I may say that we could have shown one hundred blooms of Marquise de Castellane and Ferdinand de Lesseps. Considering the season it was nost wonderful. The whole garden, which is now filled with Roses, was one blaze of colour. I should say that from end to end the garden, is nearly 100 yards long, and this is literally full of Rose trees, no other plant is allowed to grow. The Roses are planted in lines of about forty in a line, each line as a "black line, as the containing or variety so that in a taking." each line as a rule containing one variety, so that in staging

Mr. Baker goes down the line, cuts one bloom for the forty-eight, one for the thirty-six, one for the twenty-four, three for the trebles, and two or three for the spare box. These are brought to the lady whose name is immortalised by the magnificent Rose raised by Mr. Turner, which Mr. Baker has shown so grandly this year. She wires the Rose, another member of the family finds the label and holder, and another places it in the stand according to her directions; so that staging is done in a marvellously short time. We dined at five, began to stage at six, and by eight o'clock all was completed. But a staff of six people were at work, and, as I have said, the Roses were all together.

together.

But to return to the blooms themselves. I have the opinion of the greatest amateur and trade growers to endorse my own when I state that for colour, form, substance, and health these blooms have never been surpassed, and yet they have had scarcely any sunshine. It seems to me, therefore, conclusive that Roses do not require much sunshine. Now, take the opposite case. Let an ardent rosarian visit a large nursery in the first week of July in an ordinary year, when the sun has been shining in his strength for a few days, and what will be the result of his visit? Disappointment, I fearlessly assert. He will probably see thousands of blooms, he will walk through rows of standards and lines of Manettis, and he will look in vain for the grand blooms he expects to find. The sun has taken all the life out of the blooms. He will be unable to distinguish, except by the wood, Dr. Andry from Charles Lefebvre, or Mons. Noman from Marguerite de St. Amand. Depend upon it, what the Rose most wants to show itself off to the best advantage is cool gloomy weather.

But how about wind and rain like we have had these thirteen weeks? Ah! there I grant you is the evil. The Rose suffers dreadfully from violent rain, but still more from rough winds. Whilst we were staging for Norwich the wind was so cold and rough that a great rug was hung up in front of the boxes to protect the blooms as much as possible; and how the flowers did stand such a tempest as we had I do not know. The damage done was plain enough, the broken shoots and frayed flowers here and there plainly showed this; but yet the strength of the plants was so great that the blooms resisted even this drawback, and nobly repaid their owner for his ceaseless care and labour. The next morning I visited Mr. Walter's nursery at Mount Radford, and although he had only a few blooms out, those were finer than I have seen for years.—WYLD SAVAGE

THREE GOOD NARCISSUSES.

As the time is coming very near when the annual supply of bulbs will have to be ordered, allow me to call attention to three Narcissuses which may be ordered at the same time, the price of each being only a few shillings per hundred. The first to flower in spring will be the one popularly known as "Butter and Eggs," a double variety of the common Daffodi, and which is catalogued under the name of Narcissus incomparabilis aurantiacus fi.-pl. The next is a variety of the same species, N. incomparabilis sulphureus fi.-pl., the common name for which is "Codlins and Cream." This is not quite such a good variety as the first mentioned.

The third and latest to flower is the double form of the Pheasant's-eye Narcissus, Narcissus poeticus fl.-pl. This is without doubt one of the gems amongst hardy flowers, and simply becomes indispensable when once grown. Though these will one and all grow in almost any position, they at the same time thoroughly appreciate good culture in a well-worked piece of ground. "Butter and Eggs" is quite as fine as a Rose when well grown. The bulbs require planting about the end of October.—R. P. BROTHERSTON.

WORMS, SLUGS, AND TOADS.

In taking a walk round the kitchen garden one evening last week, and observing how much better the weeds grow than the ordinary crops, my attention was drawn to a toad struggling to make a supper off a large worm. It had half swallowed it, and appeared to experience a difficulty in getting rid of the remainder; but after at least a dozen attempts by alternately putting out its paws to hold it steady so that the delicacy might not be lost when opening its mouth to take another bite, the length was reduced to about an inch. This was stiff, and the quaint look of the toad was an exhibition; the only thing I could compare it to was a close-cropped pug dog with a cigar

in its mouth. At last at one gulp it was gone. This was the first time I ever saw a toad eating worms, or even knew that they ate them. On mentioning it to my kitchen garden foreman he said, "Did you ever know that slugs eat worms? Well," he says, "there is a white slug which does, and when I come across one I will show it you." He has found one today, and I have sent it to you; there may be nothing new about it, but certainly it is new to me. I am sorry for the poor worms; I wish they could eat the slugs, for they are a dreadful pest this season. Unless the crops of Lettaces, Peas, Cauliflowers, and French Beans are continually dusted with lime they are devoured. There is abundance of birds here, but they prefer Strawberries and Cherries to them. I have had some young ducks running about, but they are fancying the Red and White Currants, so they are shut out. I suppose I must adopt the best remedy, and that is catch and kill, but the process is a slow one.—J. G.

[The worm-eating slug is well known to us. It is the Testacella haliotoides, and has been plentiful this year in gardens in the western suburbs of London.—EDS.]

NORWICH ROSE, &c., SHOW. JULY 9TH AND 10TH.

This was a special Exhibition organised by the Norfolk and Norwich Horticultural Society in commemoration of its fiftieth anniversary, and was held under the most adverse circumstances as regards weather in the grounds of A. L. Chamberlain, Eq., Norwich. Notwithstanding the concurrence of six or seven other shows on the same days, and the outlying position of Norwich, a very liberal and well-framed schedule brought a large competition, the leading smateurs from far and near putting in appearance inful force; and Mr. Field, the Hon. Sec., who has evidently the bump of organisation well developed, may be congratulated on the successful issue of his well-directed labours.

So far the Norwich Exhibition may be said to have been the

So far the Norwich Exhibition may be said to have been the Rose show of the season; and where Canon Hole is judging and Mesers. Paul, Cant, Baker, Jowitt, Curtis, Soames, Fellows, Nicholls, and a host of rosarians great in name and in deed are competitors, the fact can hardly be gainsaid. Mr. Baker, the "Hercules of the West," never appeared in finer condition, and rarely has his stand of thirty-six single trusses been excelled by smatter or nurseryman.

amateur or nurseryman.

The Norwich Society offered a ten-guinea champion prise for the most points obtained by a prizewinner in various Rose classes, and this fell to Mr. B. R. Cant of St. John Street Nurseries, Colchester. Mr. Jowitt of Hereford carried off, also by points, the amateur champion prize offered by Messrs. Pegler Brothers, Norwich.

Norwich.

In the nurserymen's class for forty-eight varieties Mr. B. R. Cant was first with grand blooms of Marie Baumann, Madame Nachury, Horace Vernet, Mdlle. E. Verdier, Sir Garnet Wolseley, Madame H. Jamain, Exposition de Brie, François Michelon, John Hopper, Louise Peyronny, Duke of Edinburgh, La France, Abel Carrière, Sophie Coquerelle, Etienne Levet, Baronne de Bothschild, Marie Finger, Mons. E. Y. Teas, Niphetos, Fisher Holmes, Prince Camille de Rohan, Rubens, Madame Bravy, Maurice Bernardin, Princess Beatrice, Camille Bernardin, Maréchal Niel, Général Jacqueminot, Marguerite de St. Amand, Duke of Wellington, Souvenir d'Elise, Hippolyte Jamain, Madame Hunnebelle, President, Xavier Olibo, Madame G. Schwartz, Prince Arthur, Etienne Dupuy, Marquise de Castellane, Mons. Noman, Dr. Andry, Pitord, Madame C. Joigneaux, Comtesse de Nadaillac, Victor Verdier, Marie Van Houtte, Charles Lefebvre, and Sultan of Zanzibar. Messrs. Paul & Son, The Old Nurseries, Cheshunt, were second with flowers of remarkable substance and colour but smaller in size. Their stand included good specimens of Duke of Teck (Al), Charles Darwin, Mons. E. Y. Teas, Henri Ledechaux, Mdlle. Eugenie Verdier, François Michelon, Sultan of Zanzibar, Abel Carrière, Marquise de Mortemart, Elie Morel, Duke of Edinburgh, Princess Beatrice, and Devoniensis. Messrs. Ewing & Co. of the Katon Nurseries, Norwich, obtained the third position. For twenty-four varieties, single trusses, Mr. B. R. Cant and Messrs. Paul & Son took first and second honours in the order named. Mr. F. Cant was third.

was third.

In the amateurs' class for thirty-six single trusses Mr. R. N. G. Baker of Heavitree, Exeter, was first, his flowers being of large size, brilliant in colour, of great substance, and very even. A remarkably fine bloom of Mrs. Baker had the post of honour; and in her train followed Madame Lacharme, Jean Soupert, Etienne Levet, Maurice Bernardin, Marie Baumann, Marquise de Castellane, Dupuy-Jamain, Abel Carrière, Mons. E. Y. Teas, and Thomas Mills, all in splendid form and specially noticeable, but Mr. Baker's was not a "tea party," as not a single Tea or Noisette was in the stand. Mr. W. Nicholls, gardener, Drinkstone Park, Bury St. Edmunds, was second, showing some very fine Teas, most notably Niphetos (very large and clean), Alba Rossa, Souvenir d'Elise, Devonienss,

and Maréchal Niel. Mr.J. L. Curtis of Chatteris was third with very good flowers. In the local amateurs' class for twenty-four varieties, single trusses, Miss Penrice of Wilton House, Norwich, was first, and well sustained her reputation, securing the silver medal offered by the National Rose Association.

In the open classes for twelve blooms of Baronne de Rothschild. La France, Alfred Colomb, Charles Lefebvre, and Maréchal Niel some good flowers were staged, but Maréchal Niel and the yellows were wanting in colour all through the Show. Some good Teas were staged in each class, Mr. Jowitt, who was first in the amateurs' twelve, having Rubens and Niphetos in their best form.

The exhibits of new Roses in the special classes were, as frequently happens, unsatisfactory, most of the exhibitors having staged their best blooms in the general classes. The best recent English-raised varieties, to which I may now safely give at least the proportionate pre-eminence over their continental rivals, were the proportionate pre-eminence over their continental rivals, were Duke of Teck, extremely brilliant, and the nearest approach yet obtained to a good scarlet Rose; Mrs. Laxton, very symmetrical and well furnished; Charles Darwin, good, and a Rose I can thoroughly recommend for growth and as a free bloomer; Magna Charta, large brilliant Rose; Sultan of Zanzibar, dark but shaded with shelly petals of much substance; Mrs. Baker large, and as shown by Mr. Baker a very striking Rose. Mr. Bennett's Hybrid Tea Duke of Connaught is very bright in colour, and will probably prove an acquisition as a show Rose; and if I mistake not, Mr. Cant's Prince Arthur, a good Rose which was so modestly and economically sent out, will yet be found in many winning stands, and in quarters where it has not yet been tried. Amongst stands, and in quarters where it has not yet been tried. Amongst the new continental varieties those which showed best at Norwich the new continental varieties those which showed best at Norwich were A. K. Williams, a more replete Horace Vernet; Boildieu, a remarkably bold and vigorous growing Rose, and as shown by Mr. Curtis an improvement even on Marquise de Castellane; Mons. R. Y. Teas, very well formed and bright in colour; Jean Soupert and Abel Carrière, both good darks with plenty of substance.

Boses were generally fine and in good colour at this Exhibition,

notwithstanding the continued sunless, watery, and boisterous weather they must have experienced; and should a reasonable

amount of sunshine and increase of temperature intervene, good blooms may be anticipated at Birmingham on the 24th inst.

In the class for new or rare plants, although large prizes were offered there was nothing calling for special remark, as practically there was no competition. Some good exotic Ferns came from Mr. Trevor, and the Marchioness of Lothian and Mrs. Burroughes showed fine specimens of Cycas circinalis and Adiantum

cillimum.

Messrs. Daniels Brothers had some excellent Zonal Pelar-coniums both in pots and as cut flowers. The variety Mrs. Turner goniums both in pots and as cut nowers. The variety Mrs. luther had immense trusses of a distinct purplish-rose colour standing well above the foliage. In the cut blooms Ellen, Mrs. Findlay, Apple Blossom, Mrs. Lankester, and Dreadnought were the most attractive. Messrs. Daniels also showed some good seedling and named varieties of Coleus, and a first-class certificate was awarded the standard of the standard carmine and vellow, and them for D. T. Fish, brightly variegated carmine and yellow, and a decided advance in those shades. Messrs. Ewing & Co. and Messrs. Bell also sent important collections of shrubs and plants not for competition.

Fruit, considering the season, was good. For the collection of eight varieties Mr. G. T. Miles of Wycombe Abbey Gardens was first. He had a very good Smooth Cayenne Pine, well-finished Black Hamburgh and Buckland Sweetwater Grapes, Bellegarde Peaches, Murray Nectarines, Golden Gem Melon, Brown Turkey Figs, and Elton Cherries; Mr. Coleman of Eastnor Castle Gardens being second. For the collection of six varieties, Pine Apples Figs, and Siton Cherries; Mr. Coleman or Eastnor Castle transens being second. For the collection of six varieties, Pine Apples excluded, Mr. Coleman was first, Lord Suffield second. Grapes as might be expected were not well coloured nor ripened. For three bunches of Black Mr. Coleman was first, Lord Suffield second, and E. Miller Mundy, Esq., Shipley Hall, Derbyshire. third. For three bunches of White Mr. Mundy was first, the Rev. H. Muskett second, and Mr. Miles third, Mr. Mundy being also first for the single bunches. Melons were good, Mr. Coleman being first both the green and grarlet-fieshed varieties. the green and scarlet-fleshed varieties.

the green and scarlet-fisshed varieties.

For the collection of vegetables, eight varieties, Mr. Miles was first, showing Nantes Horn Carrots, Stamfordian Tomato, and William I. Pea very fine. The best single dish of Potatoes was shown by Capt. Cattling of Wisbech, the variety being Rivers' Royal Ashleaf in the finest possible condition. He also showed a pebble-shaped variety called Swan's Egg, very smooth and clean. For thirty-six pods of Peas both the first and second prizes were awarded for William I., nearly all the late varieties being wanting. Lerd Suffield was first and Mr. W. Rae second. This was altogether a good Show and well managed.—T. Laxton, Bedford.

ROCKERY PLANTS.

I AM glad to see "D., Deal," speaks so highly of Ramondia pyrenaics in his article on herbaceous plants in your number for June 26th. If he has no greater favourite amongst his alpine plants, I venture to say that all who have tried it on a rockery will agree with him. It is easily grown, exceedingly

hardy, for the intense cold of last winter did it no harm, and it is wonderfully prolific in flowers. I have it growing on a partially shaded spot, the shade being afforded by a deciduous tree, so that in winter it has the full sun. When it starts into growth in spring it is almost impossible to give it too much water. The foliage is peculiar, thick, leathery, and heavily creased. The lovely pure grey flowers, something resembling those of the Potato, spring up from under the foliage, and they are very conspicuous.

I find that Sedum Sieboldi variegatum is another perfectly hardy plant, and very beautiful on the rockery. One advantage of the great cold and unusual length of last winter is, that we now know what things will stand our climate, for we are not likely to have a more severe test of what a plant can bear than the winter of 1878-9. This Sedum acquires the full beauty of its variegation only under the full blaze of the sun. Unfortunately slugs are very fond of it, and unless carefully

looked after will speedily destroy its beauty.

The red Christmas Rose (Helleborus abchasicus), is a fine plant for early spring. It flowered late but very well this year, and I have been successful in saving a good deal of seed. The pods are handsome, and ripen about the middle of June. The whole plant is exceedingly graceful, much more so than the common Christmas Rose, which, however, is invaluable on account of the season in which it flowers.

Soldanella alpina is an old favourite with me. It grows well in peat in a shady corner. I remember it many years well in peat in a shady corner. I remember it many years ago grown as an edging to the beds in an "Italian garden" at Menabilly, Cornwall. It has entirely disappeared from there now, and no trace of the pretty little alpine can be found. "D., Deal," speaks of its "minute fringed flowers," but it deserves in reality a higher place. The fringed flowers are small certainly, but still conspicuous, and very lovely on close inspection. I have to save seed from it this wear, but it is not inspection. I hope to save seed from it this year, but it is not yet ripe.

Sanguinaria canadensis is a curious plant, sending up its white flowers very early in spring, and shortly afterwards the leaves appear. The whole plant dies down in summer and is easily lost. The same thing may be said of the blue Anemone apennina. It comes up with fine foliage, and its beautiful blue flowers open gloriously to the spring sunshine as if en-joying the return of warmer and brighter weather, but then the whole plant speedily disappears and may easily be rooted up during summer operations in the rockery.

Trillium grandiflorum has made efforts to grow, but somehow the efforts have failed with me hitherto. I have it in a damp shady corner, but I am afraid it will not succeed. It

is expensive for some reason at the present time.

There are few things on the rockery more delightful than the Daphne cneorum. Its creeping stems must be covered as they grow, and then the plant will do well and amply reward any pains that are taken with it. Its shrubby foliage is very pretty, and the flowers deliciously sweet and showy, and they come in spring. Sweet-scented flowers are not common in the early months, and therefore this Daphne is all the more precious. The Cheddar Pink (Dianthus cessius) is very pretty but almost too short-lived, and slugs will find it out if they can. It will grow on a dry open part of the rockery bed, but will succeed almost anywhere. This and the Sanguinaria can be protected by sinc collars from the depredations of their great enemy the slug; but the protection is an ugly one, and it half spoils a rockery to see it dotted with such unsightly protectors. I use it round very precious things which I am trying for the first time because it is safe, and, so far as my experience goes, a certain protection.—A GLOUCESTERSHIRE PARSON.

NOTES AND GLEANINGS.

SIR HENRY W. PREK, Bart., M.P., has done a kind act to the inhabitants of the metropolis by the part he has taken in securing the delightful retreat of BURNHAM BERCHES to the public for ever. The City Lands Committee recommended the purchase, under the powers of the Open Spaces Act, 1878, of the open and waste lands referred to, the purchase money to be paid out of the grain duty fund. The price of the property was fixed at £12,000, independent of the timber, valued at £6000. Of this land 175 acres are freehold, enclosed, and 374 acres open. The Corporation had no power to purchase enclosed land out of the grain duty. As soon as it became known that the Corporation had the purchase in contemplation certain persons endeavoured to make money out of

the transaction, and the consequence was that the open space | could not be purchased without the enclosed land. In the difficulty Sir Henry Peek came forward and offered to make paying £35 per acre, and thus the difficulty was surmounted and the land secured.

- THE AERIDES HOUSE at MESSRS. VEITCH'S NURSERY AT CHELSEA is now extremely attractive, the fine stock of healthy plants flowering with great freedom. A. odoratum is represented by many fine spikes and varieties, and A. Lobbi is in great beauty. The extremely bright Dendro-bium suavissimum is also in bloom, and D. moschatum has remarkably fine flowers. Cattleya Mendeli and Lælia purpurata also command attention, and Phalænopsis grandiflora aurea is splendid. The Orchids out of flower are as usual in admirable condition, and not the least interesting amongst them is a fine collection of the remarkable Angreecum sesquipedale which recently arrived in excellent condition, the finest importation that has ever been seen in this country. Tuberous Begonias are also in full beauty; the collection is very large, and contains none but superior varieties. Some distinct new varieties are unsurpassed for richness of colouring, and a large double variety, Veitchii, has flowers of unusual size and form. The charming miniature B. Davisii is not only beautiful in itself but is proving a valuable parent, some of the newer seedlings combining elegance of habit with extreme floriferousness and brilliant colour. The plants are grown cool, and tell by their excellent condition that these Begonias do not require anything like the amount of heat to which they are often subjected in private collections. Amongst other plants in the cool house devoted to insectivorous plants, the fine hybrid Sarracenia Chelsoni is luxuriating; it is very distinct, and free.

garden crops. Mr. Baker, the successful gardener at Coombe Cottage, Kingston-on-Thames, has used this fertiliser somewhat extensively this year, both in the garden and on the home farm belonging to Mr. E. C. Baring. As the nitrate has not been applied to every portion of the crops in the garden its effects show with greater clearness. Those portions that have been dressed are extremely luxuriant, and the observer can "tell to an inch" how far the dressing has gene. We have not seen such Cauliflowers this year as those in the garden referred to; and Peas, Potatoes, indeed all crops to which the nitrate has been applied, are in remarkable health and colour. The same marked effects of the nitrate are discernible on the farm. The quantity applied both to farm and garden crops by Mr. Baker was at the rate 1‡ cwt. per acre.

- THE EVENING FETE IN THE GARDENS OF THE ROYAL HORTICULTURAL SOCIETY last week was a very successful one. Besides the electric light, of which several were provided in the gardens, conservatory, and exhibition tents, the gardens were also rendered beautiful by many thousands of coloured lamps employed in festoons by the sides of the walks and suspended from the trees, and the grounds were further illuminated at intervals with coloured fire. Notwithstanding the rain, which fell rather freely at the opening hour, a large and brilliant company assembled. Flowers, vocal and instrumental music, scientific appliances of various kinds, botanical curiosities from the museum of Messrs. Veitch & Sons, and a collection of beautiful miniature plants from the establishment of Mr. Bull, afforded interest and pleasure to the numerous visitors. The entire arrangements were admirably carried out, and gave great and general satisfaction.

—— In reply to a question put by Lord Enfield in the House of Lords on Thursday last, Earl Granville stated that it was perfectly true that Her Majesty's Commissioners for the Exhibition of 1851 had commenced a SUIT IN CHANCERY AGAINST THE ROYAL HORTICULTURAL SOCIETY in order to recover possession of the Gardens at South Kensington; but the Commissioners of the Great Exhibition never had been and never could be under any liability to pay the debentures of the Royal Horticultural Society, and, that being so, they did not propose to make any compensation. The Chancellor

the one to which the principal prize (£50) has been awarded being from Mr. R. H. Vertegans, Chad Valley Nurseries, being from Mr. R. H. Vertegans, Const Variety Nurseres, Birmingham. Mr. Vertegans has been engaged to carry out his design at a cost of £5000. It provides for spaces to be devoted to cricket, archery, croquet, and other outdoor games, a drill ground for the volunteers, and a lake covering a space of the control of the country of the c of about nine acres. Some twenty thousand trees and shrubs are to be used in planting the grounds; and arrangements will be made for shelter, refreshment rooms, &c. Outside the fence of the park, and encircling it, there will be a spacious drive for carriages, &c.

- In Mr. Bull's Nursery at Chelsea is an extensive and striking collection of Hæmanthus Kalbreyeri now flowering, the great mass of brilliant heads producing a gorgeous-effect. One of the heads measures 2 feet in circumference, perhaps the finest example that has yet been seen of this brilliant plant. Some fine spikes of Odontoglossum Alexandras attract notice, and especially so the glowing Oncidium macranthum hastiferum, the flowers of which are extremely fine and the colours very bright. Some new Sarracenias of large size and rich colours also arrest attention. They will be heard of again, being both distinct and beautiful. The new Coleuses are being "propagated off their legs" to meet the demand for them, which suggests that Coleuses are rather coming in than going out of fashion. As an instance of what may almost be termed a curiosity in the trade in plants, large cases branded for Africa were being packed with stove plants to be transmitted forthwith.

· Lord Londesborough's garden at Norbiton is justly famed for the fine collection of Orchids that it contains, and for the immense number of plants that are grown for room decoration, the number not infrequently amounting to a thousand dosens a week; yet more striking even than the departments alluded to at the present time are the grand-crops of Grapes now hanging in the principal range of glass devoted to Vine culture. This range is 250 feet long, and wide and lofty in proportion, and except two divisions from which the Grapes have been cut, one of Black Hamburghs and the other of Muscats (ripe at the end of May), the entire length is occupied with Vines and crops of which the cultivator, Mr. Denning, has great reason to be proud. For uniformity of size of bunches, and their fulness, and for regularity of berries, the crop throughout the range is equally remarkable. The bunches range from 2 to 3 lbs. in weight, the latter being the maximum weight suitable for packing and sending the fruit long distances; if heavier the Grapes are aps to be crushed in transit. The bunches have been thinned also for travelling—that is, the berries are just wedged sufficiently that they cannot be displaced by any ordinary shaking. The Vines which were started in January are wholly in outside borders, which have never been covered with fermenting material and it is not conceivable that their condition and crop could be improved by any such application. Top-dressings of rich manure are given, which afford some protection to the roots and invigorate the Vines at the same time. The laterals and not stopped at the conventional one or two leaves beyond the bunch, but wherever a leaf can have free unobstructed light there it is permitted to expand, and thus the roof is covered with foliage, and yet there is no overcrowding.

At the Exhibition of the PELARGONIUM SOCIETY the following certificates were awarded after our reporter left the Exhibition. Show and large-flowered varieties:—The Baron, (Foster), a fine flower, rose-salmon lower petals, dark upper-petals, and white throat. Fireball (Foster), rich salmos tinged with orange, extremely bright; upper petals darker in colour; a handsome variety. Flag Captain (Foster), lower petals pink with dark veins, upper petals large and dark. Sensation (Foster), lower petals rose-pink, with dark veins and blotches; throat white, upper petals dark; excellent Alice (Foster), lower petals light pink, throat white, and upper petals very dark. The Pope (Foster), lower petals pinkish violet, upper petals dark, large, throat white; a very bold flower. Charlotte (Matthews), a very soft reddish tinge, near large, the petals which with the petals and the petals are petals beach to the petals and the petals are petals beach to the petals and the petals are petals beach to the petals are petals are petals. flower; Joe (Matthews) lower petals bright pink, apper petals dark, white centre, large and good; plant floriferous. Fancy varieties:—Sarah Bernhardt (Turner), rose faintly tinged with House of Commons.

THE WOLVERHAMPTON TOWN COUNCIL recently advertised for plans for laying out 47 acres of land near that bright scarlet-cerise; excellent substance. Horatio (Denny), town as a public park. Twenty-seven designs were sent in,

sight scarlet, dense trees. Commandes-in-Ukief (Denny), publicant scarlet, very free and showy. Allegro (Denny), very see deep pink. Romeo (Denny), rich scarlet, very large trues. Auste Smith (Oathin), rich deep rose, very good. Régar Cathin Cathin), excellent scarlet, fine flower, and large trues. Fanny horpe (Cathin), salmon with bright orange centre; good form oth in flower and trues. Double Zonal varieties:—Pioneer Denny), bright scarlet cerise. Dauntless (Denny), deep scarlet, ery showy. Decorative varieties:—Mdlle. André (Jackson), ower petals flushed with pink, upper petals light orange red; lower fringed and pleasing. Black Prince (Hayes), maroon, alle margin; free and good. Princess of Walse (Hayes), owers large but good, white veined with rose tint, throat white.

—— WE are informed that the LEBK BORN SHOW has been sostponed until the 22nd inst. in consequence of the lateness f the Boses in the district.

— WE have received from Mr.J. Carter, Keighley, a BOX F ROSES—the Burgundy Rose and Rose de Meaux. "They rere," writes Mr. Carter, "favourites of mine when a boy ifty years ago, and I have grown them since that time. De fleaux is now covered with bads, and every plant will soon be ery pretty." These are very enjoyable Roses, and are specially suitable for borders and for yielding a profusion of ragrant blooms and pretty buds.

—— RELATIVE to the publication of a remount that the CURATORSHIP AT KEW had been offered (it was not stated by whom) to a gardener in Scotland, Mr. Smith, the present able surator, informs us that he has no knowledge of any change of the nature indicated, nor has, we are informed, Sir Joseph Hooker.

— We recently noticed in Messes. Carrer & Co's narsery at Forest Hill a batch of seedling Gloxinias, many of which were unusually good both in form of flower and colour. This was especially noticeable in the shades of blue and purple, ome being extremely rich and clear. Lapagaria alba was learing several fine flowers. That curious Asclepiadaceous plant Ceropegia elegans was also flowering, and judging by the large stock of young plants there must be a good demand for it. In the grounds some excellent Pansies were in flower, one of which we observed was a true black with a light eye.

levoted to them at Kew:—Oncidium ampliatum has an infloescence 4 to 5 feet in length, thickly clothed with pale yellow
lowers. Dendrobium McArthuri, a native of Ceylon, is a fine
species. The sepals and petals are of a pale purple tint; the
labellum is small, of a similar colour, but marked in the centre
with rich deep purple. Epidendrum radiatum is a curious
Mexican Orchid; the sepals and petals are pale whitish green,
the labellum white, with fine dark lines radiating from the
sentre to the margin. Hartwegis purpures is pretty with its
osy flowers, and Dendrobium Pierardi is flowering well. Dentrobium calceolus is bearing two fine spikes of cinaamonsoloured flowers. The epiphytal Brassavola venosa has small
hale yellow flowers with a white labellum, and the charming
ittle Mesospinidium sanguineum has several spikes of rosy
lowers.

ROSE ELECTION.

As arranged, or rather suggested, last year, I propose to make he Rose election for 1879 in two portions. Firstly, then, the newer varieties of the Rose as looked at in an exhibition light, and secondly as garden Roses.

The first question, then, will stand thus—Name the best hirty-six exhibition Roses introduced since 1871, distinguishing the best twelve and the second best twelve in any way hat makes it plain how they stand. I think that none but surserymen and large amateur exhibitors should reply to this.

For garden varieties, name the thirty best garden Roses, narking the best ten and the second best ten. To this query I shall be pleased to have replies from all quarters.—JOSEPH HINTON, Warminster.

HEATHS AND HARDWOODED PLANTS IN SUMMER.

A FEW remarks on these plants may possibly be useful to some readers of the Journal, as success in a great measure depends upon the treatment now afforded. Plants of Erica Cavandishiana that have flowered should at once be carefully looked over, and all the old blooms must be removed. Keep

the plants indeors for a menth or until some growth has been made, when they may be placed outside for a few weeks to solidify the growth. E. depressa must, however, he placed solidify the growth. L. depressa must, however, he placed when the plants have done flowering in a sunny situation outdoors; also plants of this species which have not flowered this season would be better if placed out where they will have the benefit of all the sun and air possible. These two species do not usually flower well two years following, as from their free and prolonged flowering there is not enough time afterwards for the growth to ripen for the ensuing season. The early-flowering Heaths and such as were potted early will since have made good growth, and may now be placed in the open air to thoroughly ripen the weed. In removing the general stock of Heaths to the open air it is well to place them for a few days at the north side of a wall or shelter them from the direct rays of the sun under a temporary awning, as when the sun is very powerful it causes the leaves to turn brown. The pots must be protected on the side towards the sun by canvas or matting, or the roots in contact with the sides of the pots will be injured. The general stock of young Heaths that were potted early in the season will be making free growth, and must receive attention in stopping and tying out so as to secure well-furnished symmetrical specimens. The general stock of young hardwooded plants will require similar treatment, training them before the shoots get too strong to bend without injury. Aphides are often troublesome on young Leschenaultias and Aphelexes. The best plan is to dip the plants in tobacco water, as the insects are difficult to destroy by tobacco smoke except that be applied in such doses as to injure the plants. All hardwooded plants outdoors must be placed on a good thickness of ashes so as to exclude worms, but be careful to keep the ashes constantly moist. When the plants are outdoors they will in dry weather require more water than when under glass, and in very hot weather a slight shade at midday will be beneficial.— G. A. G.

OLD ROSES.

Having seen in the last two numbers of the Journal of Horticulture that some of your correspondents are interested in hearing about the Old Yellow Rose, I write to say that I have a plant of it in my garden, which is a very old one. When I first came here, more than thirty years ago, there was an old plant of Yellow Rose, which must have been 6 feet high, against an old wall overhung by Yew trees. Most years it flowered very profusely, but not many of the Roses were quite perfect in colour, some being a dull dirty yellow and some quite green. They were very double, and did not open well, like some of the old Cabbage Roses. This tree died, but I have a sucker from it which has not yet flowered, I think owing to its being in a bad situation against the house, and I intend having it moved. I may add that I know the old double yellow Rose well, as quite distinct from the more modern yellow Briars, which I also have. It is more like the old white Rose, which I have heard called Needham Rose or White Provence, only yellow. I have also the old Blush Damask, some white with pink streaks, and here and there a pink petal; the old Portland, Tuscan, and a deep red Rose apparently of the Damask tribe, which I have been told is called the Pæstum Rose. The latter I brought from the north of Aberdeenshire. All the new kinds of Roses flourish particularly well in this garden, and the flowers attain a size I never saw surpassed; but I have been always anxious to keep up the old sorts, including old Cabbage, Blush, and Moss Roses, though called by my late gardener "rubbish."—M. G., Isle of Wight.

[You are a better judge of Roses than your late gardener.

BOMAREA CARDERI.

"THIS plant," writes a Kew correspondent, "commends itself to our notice by several valuable and excellent qualities, which are now beginning to be appreciated by plant-growers, and most deservedly; for, unlike many newly introduced plants, its merits have been found to increase since it first appeared before the public. Several species of Bomarea have been known in this country for a considerable time—that is to say, during the present century; for the first to be introduced was B. Salsilla, which was brought from South America in 1806. Since that date about a dozen species and varieties have been introduced possessing various degrees of merit; but they have all been eclipsed by B. Carderi, which was found

by one of Mr. Bull's collectors in New Grenada a few years ago.
This species is a twining plant with purple stems and bright green leaves, the petioles of which have a peculiar twist which reverses the normal position of the blade. The flowers are

horne in large, loose, umbel-like pendulous cymes, and each flower has a pedicel several inches in length. The periantitis in six divisions, three inner and three outer; the latter are of

brown; the former are lighter in colour, with somewhat of a greenish tinge, and are also thickly spotted.

"The plant is very floriferous and easily cultivated, and of rapid growth, which are no ordinary qualities. It requires a shallow soil of loam and sand, and the temperature of an intermediate house; but it will, no doubt, succeed in a greenhouse. There is a specimen planted out in the cool end of the

render the plant highly serviceable, as affording a supply of cut blooms which can readily be employed for a variety of purposes with great advantage. We may sum up its merits in a few words by saying that it is a really useful addition to our list of plants, and it is no doubt destined to obtain a permanent place in the horticultural world."

[We are indebted to Mr. W. Bull for the annexed engraving.]

THE LATE NATIONAL ROSE SHOW.

In order to prevent misapprehension as to the way in which the affairs of the National Rose Society are conducted, and with this object alone, I beg to assure your readers that "WYLD SAVAGE" was altogether incorrect in stating in his remarks last week on the late National Rose Show that my brother Secretary, the Rev. H. H. D'Ombrain, was solely re-sponsible for the non-postponement of our recent Crystal Falsce Exhibition. In proof of this it will be sufficient to inform them, that at a meeting of the General Committee of the Society held on the 10th June last, it was decided that such a postponement would be unadvisable.—E. M., Croydon.

PROVINCIAL SHOWS.

WIMBLEDON HORTICULTURAL SOCIETY.-JULY 9TH.

As the present season has proved such an unusually late one As the present season has proved such an unusually late one this Society acted wisely by choosing a day for holding their Show nearly a fortnight later than it is their usual custom to do, and they were also fortunate in having the extensive and well-kept grounds of Belvidere House, the residence of A. Schlusser, Esq., placed at their disposal. The Show was a good one, and well represented the horticultural capacities of the district. The cottagers also availed themselves of the several classes allotted to

represented the horticultural capacities of the district. The cottagers also availed themselves of the several classes allotted to them, and brought collections of vegetables, fruit, and flowers. Messrs. Veitch & Sons staged an extensive group of new and rare plants, as also did Mr. Thomson of Wimbledon, and Mr. Laing, Forest Hill, a group of Tuberous Begonias.

P. F. Sutton, Esq., Gibbon Road, Kingston, won the premier prize in the class for six stove and greenhouse plants with very even, neat, and profusely flowered plants. Mr. Moorman, gardener to Miss Christy, Kingston, was a very good second. Mr. Bentley, gardener to Sir Thomas Gabriel, was awarded the third prize. In the corresponding class for four plants the honours fell to Mr. Stratton, gardener to Miss Forbes, Chester House, Wimbledon, Mr. Bridges, gardener to F. B. Thomas, Esq., Wimbledon, and Mr. Law, gardener to R. S. Dean, Esq., in the order of their names. The best exotic Ferns were exhibited by Mr. Bridges, Mr. Bentley, Mr. Moorman, and Mr. Stratton. Mr. Bentley and Mr. Law shared the honours for Lycopodiums. In Fuchsias there was a marked falling-off in numbers over past years. Mr. Stratton staged the only six plants, a very creditable collection, to which the first prize was deservedly awarded, and Mr. Law was placed first for three plants. Zonal Pelargoniums are always well represented at this Show. Several exhibitors staged collections remarkably well finished. In the class for six plants in 9-inch pots Messrs. Bentley, Law, and Stratton were placed first, second, and third respectively; and in the class for twelve plants in 6-inch pots Mr. Bridges, Mr. Bentley, and Mr. Law all exhibited good collections, and were very close for first, second, and third positions, which were awarded in the order of their names. Other successful exhibitors of Zonals were Mr. Elliott, gardener to S. Howard, Esq., and Mr. W. Mayes, gardener to E. Holroyd, Esq.

Very seldom indeed have we seen Coleuses staged so well before; as exhibited here by Messrs. Callard,

K. Holroyd, issq.

Vary seldom indeed have we seen Coleuses staged so well before; as exhibited here by Messrs. Callard, Elliott, and Bridges they were truly beautiful. Table plants are always neatly shown here, Messrs. Callard, Bridges, Bentley, and Law coming in this year for the lion's share of the prizes.

ROSES.—These were well and numerously exhibited. The best blooms in the Show were undoubtedly those exhibited by W. Scott, Req., the Treasurer of the National Rose Society, who was awarded the first prize for twenty-four distinct in the amateurs' class and first prize for three blooms in a special class. Amongst the best of Mr. Scott's blooms were François Michelon, Charles Lefebvre, Dupuy-Jamain, Marquise de Castellane, Madame Willermoz, and Jean Cherpin. For twenty-four blooms, distinct, in the open class Mr. Moorman was far ahead of his compeers with a very fresh and even collection. This is the seventh year in succession that Mr. Moorman has won the premier prize in this class. Mr. Gibson, gardener to J. Wormald, Esq., was placed second, and Mr. Elliott third. Mr. W. Marchant was first for twelve cut Roses, and Mr. Mayes for six in the open classes.

Mayes for six in the open classes.

The amateurs' collections besides Mr. Scott's were very creditable; especially so were those from Dr. Bookless and J. E. Coleby, Esq., in the twelve distinct, and Messrs. Dixey & Saunders in the six. Dr. Bookless also obtained the premier prize for a single bloom

with a grand bloom of Marquise de Castellane, and Messrs. Coleby and Dixey were second and third respectively in the special class

Vegetables, considering the season, were well shown. Mr. Moorman was first for a collection of twelve varieties, and Mr. Bridges for six. for six. The cottagers we have already said exhibited well, especially Messrs. Callaway, Povey, Lunn, and Forder. Mr. Lyne did not exhibit for competition, but staged splendid collections of Gloxinias, Zonal Pelargoniums, &c., interspersed with Ferns.

HIGHGATE HORTICULTURAL SOCIETY.

THE annual Exhibition of this Society was held on Tuesday THE annual Exhibition of this Society was held on Tuesday last in the grounds of Fairseat House, by kind permission of the proprietor and President of the Society, Sir S. H. Waterlow, Bart., M.P., and it proved to be the best in a horticultural point of view that has yet been held. The exhibits were numerous for a suburban Show, and many were highly meritorious; this was particularly the case with the foliage plants, which chiefly occupied the central portion of a long tent. Among these the collections of six were noticeable for their good finish, and Mr. H. Hurches, gardener to H. J. Adams, Esq. Chase Park, Enfield. tions of six were noticeable for their good finish, and Mr. H. Hughes, gardener to H. J. Adams, Esq., Chase Park, Enfield, occupied the premier position with good specimens of Alocasia metallica, Yucca aloifolia variegata, and Croton pictus. Mr. B. Highgate, gardener to E. Brooke, Esq., Caen Wood Towers, followed with good plants, Alocasia macrorhiza variegata being remarkably vigorous. The President's prize for six Palms was also well contested by Mr. Ayling, gardener to S. Cuming, Esq., Hornsey Lane; Mr. Nunn, gardener to the donor of the prize; and Mr. B. Highgate; and the prizes were awarded in the ordernamed

There were some good competitors for the prize offered by the worthy Treasurer, Mr. Cutbush, for six Adiantums; and in the premier collection from Mr. Ayling we observed an extraordinarily fine A. formosum over 4 feet in diameter, vigorous and healthy. Mr. Catlin, gardener to Mrs. Lermitte, Finchley, sent an even and bright collection of six Zonal Pelargoniums, of which Ellen and Mrs. Catlin were excellent both in flower and growth. This was most deservedly awarded the first prize, for it was greatly superior to the other collections.

Among miscellaneous plants we remarked six fine Cockscombs from Mr. H. Kent, gardener to J. Lane, Esq., The Grove, Highgate, which had been extremely well grown. They were in somewhat large pots it is true, but that was their chief defect, for the heads were of great size and richly coloured, and the plants very dwarf with good and healthy foliage. The premier award was acaily obtained easily obtained.

easily obtained.

In addition to numerous collections of Fuchsias, Gloxinias, Pelargoniums, Calceolarias, &c., Mr. B. S. Williams of Upper Holloway, and Messrs. Cutbush & Sons of Highgate, both great supporters of the Society, very generously exhibited handsome groups of plants. Mr. Williams had two groups, one chiefly composed of Palms, Orchids, and foliage plants, in the centre of which was a neat specimen of Croton Disraeli. Another included an arrive of server and chiefly plants, including the bright near a number of new and choice plants, including the bright new Coleuses, Exquisite, Kentish Fire, Lord Falmouth, and Lord Oxford, and the distinct and attractive Croton camptophyllus, with narrow twisted leaves marked with yellow and green. with narrow twisted leaves marked with yellow and green. Messrs. Cutbush's group, a very excellent one, was arranged at the opposite end of the tent, and was formed chiefly of greenhouse, flowering, and foliage plants, and in front were nine boxes of cut Roses, which were remarkably fresh in colour, and several were particularly good; for instance, the varieties La France, Marie Baumann, Ferdinand de Lesseps, Beauty of Waltham, and Marguerite de St. Amand.

Marguerite de St. Amand.

Fruit was scarce and in indifferent condition, and vegetables were not very numerous but the quality was fair. The cottagers productions were arranged in a smaller tent, and comprised miscellaneous collections of plants, vegetables, fruits, and model gardens, several of the latter being tastefully designed. The weather continued fair during the afternoon, and many visitors assembled to enjoy the Flower Show, the music, and the extensive views which the elevated position of the gardens afforded. The experience of Mr. Cutbush, sen., was of great value in the arrangements of the Show, and the success of the Society, of which he was a principal founder years ago, is in no small measure due to was a principal founder years ago, is in no small measure due to the unwavering support he has accorded to it for many years past.

REIGATE ROSE SHOW.

MOST travellers by the South-Eastern Railway to Reading from Redhill have probably fallen into the same error that I had done, and imagined that the rapid and mushroom-like increase of that town was simply an outgrowth of a larger place of a similar character, the portion of Reigate town adjoining the station of that ilk fully bearing out the notion. Let me dispel their ignorance as pleasantly as mine was, and say that Reigate is a most charmingly situated country town, nestling amongst the hills of that most lovely valley of the Mole, surrounded by ample foliage, full of risiturio reminiscences, and altogether worthy of a more lengthened visit than I was enabled to pay it. The Castle has been very wisely rescued from the fate that has befallen many of our ancient montuments, and the grounds have been connected into a public garden, the keep being an attractive Rose garden, and the whole under the care of an intelligent gardener who takes a pride in his work. Well, in this good town of Reigate there has existed for some years a very pleasant Rose Society or Club of a similar character to that at Brockham to which I alluded last year. The members do not compete for money, but the prizes are given in various article of vertu selected beforehand. There is indeed one class open to amateurs not members where money is given, but this is the only one. Nurserymen do not compete. The exhibition is held in private grounds, and this year was held in the very beautiful grounds of Mr. Waterton at Great Doods; and having been saked to officiate as Judge it was my pleasure to enjoy a very delightful day, although, as in almost all days in this strange season, we had a proportion of moisture.

The Exhibition was held in two tents, the greater portion of one being occupied by table decorations, bouquets, and the various articles to be given in prizes, and the other with Roses. These were in excellent condition, and some of the boxes were very fine, notably the twelve exhibited by the Rev. Alan Cheales, so well known to the readers of the Journal by his pleasant and chatty papers ("A. C."), and was a box of which its owner might well be proud, for it obtained for him four prizes. It was first in its class, first also as the best box in the Show; and two of the Roses obtained both the medals of the National Rose Society. It contained Dr. Andry, Duke of Edinburgh, Beauty of Westerham (this is a very little known Rose, but an excellent one raised by Mr. Cattell of Westerham from Général Jacqueminot but more double; it obtained (a proof its excellence) the silver medal as the best. it obtained (a proof its excellence) the silver medal as the best Hybrid Perpetual in the Exhibition); Countess of Oxford, Marie Baumann, Souvenir d'Elise, the best Tea in the Show; Charles Lefebvre, Dupuy-Jamain, La France, very fine; Souvenir d'un Ami, and Alfred Colomb. In the box for twenty-four, open to all comers, the first prize was taken by Mr. Brown, gardener to Mr. Waterton, for an excellent stand, amongst them some very fine former excercially. Nor By Care. Mr. Waterton, for an excellent stand, amongst them some very fine flowers, especially Mons. E. Y. Teas, Alba Rosea, Souvenir d'un Ami, Marquise de Castellane, Henri Ledechaux, Souvenir d'Elise, Annie Wood, Dupuy-Jamain, Louis Van Houtte, Duke of Edinburgh, and Horace Vernet. Teas were well exhibited, as might be imagined when Mr. Brown was exhibiting "at home;" his box of twelve consisting of Comte de Paris, Céline Noirey, Joséphine Malton, Rubens, Alba Rosea, Adrienne Christophle, Bouquet d'or, Madame Berard, Souvenir d'Elise, Souvenir d'un Ami, and Belle Lyonnaise. Mr. Stone took the first prize in Teas for and Belle Lyonnaise. Mr. Stone took the first prize in Teas for Souvenir d'Elise, Duchess of Edinburgh, better than I have ever seen it; Vicomtesse de Cazes, Gloire de Dijon, Devoniensis, and Rubens. The worthy President, Mr. G. Baker, was a most successful exhibitor. Messrs. Paul & Son of Cheshunt and Mr. Mitchell of Piltdown sent some boxes not for competition, and very beautiful they were: in Mr. Mitchell's box was a very beautiful Rose, James Warden—I think James was the Christian name, but am not sure Warden—I think James was the Christian name, but am not sure—a pink sport from Madame Clemence Joigneaux, partaking of all the fine qualities of that Rose but of a very lovely shade of colour. Mr. Paul had amongst his a very lovely Rose of last year, of which a note should be taken by Rose-growers. Mdlle. Gabrielle Luizet, a most beautiful pink, deeper and more solid in colour than Mons. Noman, and unless I am much mistaken a decided acquisition. Messrs. Paul also exhibited a box of their very brilliant Duke of Teck, so brilliant that it put Duke of Edinburgh quite into the shade; and even in this cloudy year, when Duke of Edinburgh nearly always comes shaded, this most brilliant flower was of the clearest and most intense soarlet. Let Rose-growers, then, note Beauty of Westerham, Mdlle. Gabrielle Luizet, James Warden, and Duke of Teck as worthy of being added to their

collections.

I might linger long over the Roses, but I desire to say something of the table decorations, which always form a marked feature of the Beigate Show. I have seen many in various places, but I say without hesitation that a more chaste and exquisitely beautiful stand than that exhibited by Miss Thomson I have never seen. The terms of the competition restricted it to Roses and foliage. With a true poetic instinct she, while interpreting it literally, left the garden with its glowing beauties and betook herself to the hedgerows, where the earlier blooming varieties of the wild Rose are lovely in their white and pink beauty. Her stand, a Marsh one, with a trumpet top, had no Rose but this in it, and with the exception of some fronds of Adiantum and a spray or two of the variegated Maple all her foliage was from the hedges also. It would be impossible to oversite its beauty; and I can only repeat what I said there, that had there been a gold medal to bestow it ought to have had it. The other stands were in excellent taste, but this certainly stood out far above the rest.

I do not know whether the treat of cut Roses was more enjoyed than the sight of the kind and hospitable President's garden which we all had after luncheon. Never have any of us seen Roses in more vigorous health, extracting strong terms of admiration even from such experienced growers as Mr. G. Paul, while the bedding-

out was in most excellent taste, the whole garden being the very perfection of order.

I cannot close these brief notes without expressing my hearly thanks to all connected with the Society, who did their very best to make a pleasant day for the visitor, in which they entirely succeeded. I send a prize list.—D., Deal.

[It was not received.—EDS.]

ROMFORD AND ESSEX HORTICULTURAL SOCIETY.

THE annual Show of this Society, which was held in the grounds adjoining Gildea Hall on July 10th, was on the whole a very creditable one. The weather for the season was favourable, and as a consequence the attendance was very good. Plants were not staged in large numbers, but most of them were well grown and m good condition. Mr. Bones staged the best group of flowering stove and greenhouse plants, his beat plants being Stephanois floribunda and Erica Candolleans. Mr. Bradley, gardener to O. E. Coope, Esq., was placed second with smaller but well-grown specimens. The best group of foliage plants was staged by Mr. Douglas, Loxford Hall; very noticeable being Croton undulatus, Cycas revoluta, Kentia canterburyana, and Dasylirion gradle. Mr. Douglas also staged the best group of exotic Ferns, his specimens of Adiantum concinnum latum, A. cuneatum, Gleichenia spelunces, Davallia Mooreana, D. polyantha, and Dicksonia antarctica being remarkably healthy and fine. Mr. Woodhams, gardener to C. P. Matthews, Esq., Havering, was awarded the second prize for very creditable specimens of older varieties. Messrs. Bones and Douglas were also very successful in the other plant classes, and other prizewinners were Messrs. Meadmore, Romferd; Saltmarsh & Sons, Chelmsford; Duck, Soder, &c. Roses were shown in considerable numbers and in excellent condition.

Messre-Saltmarsh & Son easily won the first prize for tertyeight cut Roses, some of the best being John Hopper, Moss.
Noman, Ferdinand de Lesseps, La France, Lyonnaise, Dake of
Edinburgh, Marquise de Mortemart, Marquise Adèle de Murinais,
Madame Prosper Langier, Mdlle, Marie Cointet, and Dupuy-Jamain.
Mr. Meadmore was second in this class. The best twenty-four
was staged by Mr. Harrington, gardener to E. Mitchell, Eq.,
and the best twelve by Mr. Soder. Table decorations, bouquets,
cut flowers, &c., were shown in good quantities, and Pansies in
great variety by Mr. J. Carter, nurseryman, Ilford.

Mr. Bones staged the best collection of fruit, and also the best Peaches and Nectarines. Mr. Woodhams staged good Black Hamburgh Grapes, and was placed first, the same award being made to Mr. Douglas for white Grapes, and to Mr. Worthing, gardener to A. Moss, Esq., Chadwell Heath, for a stand of three distinct varieties. Mr. Iggulden, gardener to R. B. W. Baker, Esq., Orsett Hall, staged the best scarlet-flesh Melon, a seedling raised by Mr. G. Abbey; and Mr. Groom the best single dish, and also three dishes of Strawberries. The competition in the latter and also in most of the fruit classes was very good.

Vegetables were not largely shown by the gardeners, but the amateurs made a fair display. There was good competition in the class for two Cucumbers, but most of the exhibitors staged overgrown specimens. Mr. Iggulden staged a good brace of Col.

Vegetables were not largely shown by the gardeners, but the smateurs made a fair display. There was good competition in the class for two Cucumbers, but most of the exhibitors staged overgrown specimens. Mr. Iggulden staged a good brace of Ool. Taylor's Montrose, and obtained the first prize; Mr. Bouglas being placed second with good examples of Tender-and-Irue. The best collection of eight varieties of vegetables was staged by Mr. Iggulden, the second prize being awarded to Mr. Douglas for a collection but very little inferior. In the other vegetable classes Mr. Iggulden secured five first prizes, Mr. Soder two, and Mr. Bones one. Among the amateurs a police constable, W. Elms, showed remarkably well, obtaining nearly all the first prizes in

TUBEROUS BEGONIAS AT THE STANSTEAD PARK NURSERIES.

the vegetable classes.

THE cultivation and improvement of these plants, which are now becoming so popular, have for some years received the careful attention of Messrs. John Laing & Co., and the result is that they new possess an extremely large collection of beartiful varieties. With many of these, visitors to the various metropolitan and large provincial horticultural exhibitions are already familiar; yet anyone who had seen the groups there shown would scarcely have expected to witness such an extensive and superb collection of plants as are now flowering at the above nurseries. In addition to the ordinary stock of specimen and half-specimen plants there are no less than twenty thousand seedlings, which are now being rapidly potted on. Some of these varieties evidently possess a very high degree of merit, the colours being remarkably rich and the flowers large. In a batch of seedlings of the Pearcei type are many beautiful shades of yellow, affording a pleasant coatrast with the handsome foliage.

In one house several plants of the lovely new white Begonia

Refine Blanche, which was recently certificated at South Kensington, are very striking, and although the plants are small the floriferous habit of the variety is clearly evident. This variety was raised from seed obtained by crossing Veitch's Queen of Whites with one of Messrs. Laing's seedlings, and it differs from the former chiefly in being of more compact and sturdy growth.

In no form do these plants show to greater advantage than when grown and flowered in baskets. Two of the best varieties for cultivating in baskets are Mrs. Wills and Admiration, for their loose growth and pendulous flowers render them un-suitable for pot culture. The colour of each is similar but slightly darker in the former, and it may be described as a light crimson with a pinkish tint. The flowers are very freely produced, and a basket containing a well-trained plant of either variety is a valuable ornament for the conservatory.

Where so many varieties are excellent it is no easy task to make a selection; however, most of the following have had their merits recognised at Kensington and elsewhere by the sward of first-class certificates. The best singles are T. H. Laing, a handsome flower of great size, rich scarlet. Maude Churchill, flower large, peculiar yellowish tint. La Vesuve, medium size, brilliant scarlet. Duchess of Edinburgh, orange scarlet, enormous flower. Charles Baltet, dark scarlet, very large. Paul Masurel, acute petals, bright scarlet. Massange de Louvrez, very profusely flowered, fine glowing scarlet. Sir Trevor Lawrence, handsome flower, rich crimson scarlet. Dr. Duke, large flower, pale pink, very distinct. Mrs. Howe, large flowers, petals rounded, salmon pink. Model, nest flower, abundant, deep pink. Madame Hunnebelle, extremely large, salmon, free growth. Amongst the best doubles are Marie Bouchet, a fine scarlet, good flower; Mons. Maltet, orange, large and distinct; Marie Lemoine, a handsome full pink; and Clovis, rich scarlet, beautiful flower.

Many others are deserving of note; but persons interested in these plants who wish to see them in excellent condition cannot de better than visit Forest Hill, and they will be amply repaid for their trouble.—VISITOR.

THE FRUIT CROP PROSPECTS IN KENT.

MID-KENT.

MAIDSTOWN.—It is feared that the fruit crop will be this year of the most unestisfactory nature. Cherries will be thinner than they have been for some years; in fact, with few exceptions they are a complete failure. Pears and Plums are a platty crop; the Plum trees generally are full of insects. Apples are also very uneven, though some kinds at present in places have a fair show. However, if the weather does not alter, and the nights become warmer, they will not hang. Gooseberries upon the whole are plantiful, though short at places: Black Currants in some parts are very uneven, and where there is a chance of a crop they are mostly covered with honeydow, and probably much of the fruit will drop. Red Currants promise well. Raspberries and Straw-bearies blossomed well, and with warm dry weather will be likely to grow a fair crop and pay well. Filberts and Cobs are plentiful at present, but it is too early to predict anything about the crop. In the parishes on the south side of Maidstone Gooseberries and Currants are under the average. Cherries quite a failure. Damsons bid fairly well. There are a few Mercoco, Diamend, and bash Phans, but very few of other sorts. Apples will be very few. Pears—best nearly a failure, common ones a fair crop. Nuts also bid fairly well, but it is too soon to give a decided report. West of Maidatone the fruit crop prospects are by no means satisfactory. Though there was a great show of blossom on all kinds of fruit trues but comparatively little of it "set" for fruit, and lately many of the inset developed fruits have failure of? Cherries will many of the just developed fruits have fallen off: Cherries will many of the just developed fruits have fallen off: Cherries will be psculiarly few, notably the early sorts. Here and there, however, there are some Bigurreau trees that look like bearing a fair cusp for the year. Apples will be short. Caterpillars are busy among the leaves, and the tiny Apples are fast failing off. Damson trees, assuably prolife, will give a poor return. The leaves of these are much blighted. Gooseberries are an indifferent crop. Warringtons will be very scarce; Lancashire Lads have borne the trials of the spring much better. Raspberries bid fair to be abundant. Of Chyrants, though there was a recombe of a warr large. dast. Of Currante, though there was a promise of a very large yield, it must be said that many of the Black sorts have failen off and are falling now, while the leaves of the bushes are in some cases shrivelled and blighted. The Red and White kinds look far cases shrivelled and blighted. The Red and White kinds look far more healthy, and will, it is thought, give a plentiful supply of firsts. Obb and Fiftert trees bloomed well, and the blossom set, but entury there have done considerable harm, so that this crop will not be so large as the growers had carpected. Like the Hop plants, Beach, Line, and sties trees are infested with various species of aphides.

In this partition of Boughton Monohalous and Lingley not only

is there an absence of fruit, but the foliage generally has an unhealthy appearance, and there is a quantity of vermin. Charries are very short. Apples below an average, and some kinds have almost entirely failed. Plums short with the exception of a few

aimost entirely raised. Fluss short with the exception of a new kinds. Gooseberries good in the immediate neighbourhood, but bad in some parts. Nuts apparently good.

In the Chattam district the fruit crop is exceedingly partial, but generally it is below a full average one. Apples promise a fair crop, while the same may be said of Pears. Gooseberries are below the average, and a full crop is not expected. Cherries only about half an average crops. Plums show a fair vield. In the disabout half an average crop. Plums show a fair yield. In the district immediately surrounding the city of Rochester the fruit crop may be described as very "patchy," with no prospect of anything like a large yield.

At Southfleet and its district the fruit plantations show a large yield of Strawberries, although they are very backward. Raspyield of Strawcernes, atthough they are very backward. Hasp-berries also a fair crop. Cherries below an average. Plums and Pears a good crop, and the same remarks apply to Apples. Gar-deners in the Tunbridge district do not give a very good account of their grounds, as neither Cherries, Currants, nor Gooseberries will be plentiful. Apples have tolerably good show, but high winds have cut the trees about very much, especially those in ex-posed situations. In several gardens the Cherry, Peach, and Plum trees are swarming with vermin.

WEST KENT.

Taking the northern part of this district—vis., from Halsteas' towards London and Dartford, we get the following accounts:—Strawberries a very heavy crop. Raspberries look well and bidfair for a good crop. Black Currants only a moderate crop, but Red Currants good. Geoseberries a rather indifferent crop, the frosts having considerably affected them. This also applies to Cherries. In some places the growth of Apples, Damsons, and Plums will only be moderate, a fair yield being the exception. The crop of Filberts and Cobs too will be only moderate.

WEALD OF KENT

The fruit crop in Cranbrook district will be in the aggregate by no means a luxuriant one so far as regards quantity. Cherries and Pears bloomed fully, and some sorts set well for fruit, but recently reas bloomed runy, and some sorts set well for truit, but recently the trees generally have thrown out long shoots, and the fruit has fallen in large quantities. Apples, perhaps, will be a tolerable yield if all now goes on well, but the crop will be a platty one. The same remark applies to Damsons and Plums; at places there are signs of a somewhat prolific yield, while at other places it is difficult to find more than a very few. The crop, however, will not be altogether unestisfactory if the young fruit now on the trees should all grow and ripen. Strawbrries a great crop but injured by wet. Raspberries promise a bountiful supply. Currants and. Geoseberries will be but a moderate yield.

Cherries excepted, fruit-growing is not so gigantically epeculative in Bast Kent as in the western division of the county; but perhaps a failure is more widely felt, as most small occupiers and cottagers cultivate on a limited scale. Through a splendid tract of land, extending from Greenstreet to Rainham, are to be found more Cherry orchards than, probably, in any other part of England; and there are several growers of this description of fruit whose average income from that source alone amounts to from £1000 to £1200 per annum. A uniform heavy crop is not desirable, as it creates a "glut" in the market, and only low prices are at such times realised. These are not remunerative, owing to the cost of gathering the fruit and carriage to the markets of the metropolis. Indeed, it was but a few years ago that many growers were brought into debt by their salesmen on account of some of their consign-ments of Cherries not realising sufficient to meet the charges of carriage and commission. A few weeks since the appearance of the trees betokened another such minor calamity this season; but a marvellous change has "come o'er the spirit of the dream," and the crop of Cherries in East Kent will be very short this year. Plums have fared somewhat better. Apples promised a good yield. Pears are almost a total failure.

In the neighbourhood of Ashferd Apple trees promise well, and the same remark applies even more fully to Plums; but Pears are

the same remark applies even more fully to Plums; but Pears are somety, and Cherries very deficient. Gooseberries and Currants are an average crop. In the vicinity of Smarden and Bethersden the orchards look very badly; the Apple and Pear trees have an unkindly appearance; there will be but little fruit, and that very inferior. Cherries are pretty well a failure.

In Faversham and district the crop varies a good deal. Cherries are decidedly short. Here and there may be found a fortunate orchard, but generally the crop is light. Gooseberries are plentiful, Red Currants heavy, and Black Currants a fair crop. There never was a better show of Strawberry bloom, and Raspberries are also good, while wall fruit-of all kinds is very scarce. The reports from Sittingboums, which is the centre of an extensive fruit-growing district, are very unfavourable with regard to the crop prospects, and it is clear that the ingathering will not only be a last one but also a very small one. In many orehards, and among themseemends the mest celebrated Cherry plantations.

n the district, there are numbers of trees in which a ladder will not be placed. In one or two exceptional cases, however, trees are well loaded with fruit. The crop of Apples and Pears will also be very short, and the way in which Plums are running off now makes it extremely improbable that there will be half an average crop. The only bright side to the picture is that there is likely to be quite an average crop of under fruit—Currants and Gooseberries.

ISLE OF THANET.

The hopes raised by the abundance of blossom on our trees will not be realised, as the cold nights and ungenial days which have so long prevailed have not been favourable to the maturing of the fruit. There is a fair crop of Gooseberries and Currants. Strawberries and Raspberries plentiful. A spare crop of Apples, but very few of the choice sorts of Pears; the hardier sorts hang well. Apricots and Peaches seem to be going out of cultivation for outdoor wall fruit, Thanet soil or atmosphere not suiting them, and Plums of choice kinds are replacing them. Cherries, Plums, and other stone fruits will be scarce in the island.—(South-Eastern Gazette.)

LONDON CENTRAL FRUIT AND VEGETABLE MARKET.

THE Corporation of London at their last meeting approved the City architect's plans for the erection of a Central Fruit and Vegetable Market on land adjoining the Central Meat and Poultry Markets at Smithfield, at an estimated cost of £115,000. The market will have a frontage on four streets or roads-viz., Charterhouse Street, western roadway, new southern roadway, and Farringdon Road. The main floor of the market will be as nearly as possible level with the other markets, so that the entire range will be readily approachable the one from the other. There will be three principal entrances on the east, north, and south. The plan shows an area of nearly 44,000 feet devoted to wholesale market purposes, surrounded by forty-one shops fronting the several streets, which can be used for retail or other purposes, and these occupy an area of some 16,800 feet. The general or market area is approached, not only by the three main or vehicular entrances, but by two entrances for foot passengers. The market will consist of a series of shops, thirty-three in number, having in front pitching stands for goods and waggon stands, the whole being approached by a roadway having a width of 18 feet, always clear for vehicular traffic. In the middle of the market area is a further arrangement of pitching stands, with an area of about 4400 feet, including gangways. In roofing the market the floor will be kept as clear and open as possible, the detached main roof supports or columns being thirty-seven in number, and the clear span of the roofs is 45 feet. The roofs will be of a light iron construction, with a range of glass louvres at the plate and ridge levels, affording an ample amount of light and air, so requisite for a market of this character. The height of this roof will be 28 feet to the sevel of plate and 45 feet to the ridge of louvres. There will be a roadway approach to the basement, which will be suitable for market and railway purposes. The cost of the superstructure is estimated at £115,000, but the land and approaches will cost in addition £175,937 according to the estimate. The annual charges upon the market are estimated at £14,712, and the income £16,326, leaving a surplus of £1614. No mention, however, is made of tolls, which are authorised by the Act, nor of the authority of the Corporation to dispose of the existing Farringdon Market.

WORK FOR THE WEEK.

FRUIT HOUSES.

Vines.—Hitherto the season has been anything but a favourable one for Grape-growers, and really it seems as if there were no likelihood of a change, for there is a great absence of sun heat and the nights are cold. Abundance of fire heat must be given to late Grapes, and also to intermediate crops about colouring; a minimum temperature of 70° should be maintained night and day, and air given freely whenever the state of the weather admits. Bed spider is somewhat troublesome, more so than might have been expected from the dull sunless weather; but where it has made its appearance the surest remedy is to heat the pipes to about 212° Fahrenheit, and then coat them with a mixture of sulphur and skim milk; keep the pipes hot for about an hour, and then allow them to cool down to their ordinary temperature. It is also a capital plan to sprinkle guano about the house; the ammonia given off is inimical to insect life and beneficial to the foliage. Late Grapes intended to hang on the Vines through the winter should have a final thinning, and the smallest berries should be removed, as they spoil the appearance of an otherwise

fine bunch. The rain this season has been sufficient for outside borders, but they should be well watered with tepid liquid manure if dry weather sets in. Inside borders should be kept well supplied with soft water, previously mulching them with short stable manure. As the period when scalding occurs is at head we would repeat our advice to guard against it by increased night temperature and abundant ventilation, so as to reduce the atmospheric moisture until the critical stage is past. After then fire heat may be economised by closing early to admit of the sun raising the temperature to 90° on fine afternoons. Regulate the young growths as required, adopting the extension rather than the restrictive system where there is room for it without crowding, keeping all gross laterals stopped so as to cause an equal flow of sap throughout the Vines. Houses where the Grapes are ripening should have the ventilators left open constantly, the degree of ventilation depending on the weather, with sufficient atmospheric moisture to maintain the health of the Vines. The inside borders of early houses cleared of the crop must not be neglected in watering, and if mulched they will remain moist longer, and cracking will be prevented; at the same time avoid overwatering after the wood is ripe, as that will only induce the laterals to grow vigorously. Young Vines of this season's planting should, provided the light is not too much obstructed, be allowed to grow unchecked, it being presumed that they will be cut back to the bottom of the trellis, or to three or four eyes at the winter pruning. Any supernumeraries intended for next year's fruiting should be regularly stopped at a length of 7 or 8 feet, removing the laterals from the buds intended to give fruit next year, preserving the old leaves; and as the wood will require thorough ripening a free circulation of air will be necessary, with fire heat if the weather be cold and wet. Vines in pots intended for fruiting next season should by this time have completed their growth, esp

Figs.—The second crop will now be advancing rapidly, and the fruits must be thinned where too thickly set. Attend to tying in and stopping the shoots, water the borders freely, and syringe the foliage vigorously twice a day so as to keep red spider in check. Where the fruit is ripening a constant circulation of dry warm air is required, which can only be maintained in dull cold weather by employing artificial heat. Trees in pots intended for early forcing next season must be well attended to; syringing them every day, and applying liquid manure frequently at the roots. The trees must be well pruned, especially the strong growers, as they require much cutting to induce fruitfulness. The medium growers do not need such close pinching as those of more vigorous habit.

Peaches and Nectariaes.—When the fruit is all gathered in the

Peaches and Netarines.—When the fruit is all gathered in the earliest houses attend to watering the inside borders, also syringing to keep the foliage healthy; and to assist in maturing the buds for another season's forcing. Remove if possible the sashes from the earliest house, and cut from the trees the shoots that have borne fruit and are not required for extension. A judicious removal of shoots that are not likely to be required in autumn will admit of fully exposing those that remain to light and air, and insure their thorough ripening. If the trees have been heavily cropped or show signs of exhaustion liquid manure may be applied to the inside borders, but trees that are too vigorous and less fruitful should be marked for lifting. In the succession houses fruits that have passed the stoning process should be exposed to the sun as much as possible by turning all pendant fruits point upwards, drawing the leaves aside or shortening them as may be necessary. The shoots which bear the fruit must be closely stopped. The inside borders must be well watered, and if some liquid manure is applied occasionally it will assist the swelling of the fruit. Syrings morning and afternoon until the fruit begins to ripen, when it must be discontinued, admitting air freely. In the latest houses where the fruit is stoning great attention will be necessary in keeping the inside borders duly supplied with moisture and in thinning the fruit; a Peach to every square foot of wall or trellis covered by the tree is ample. Timely thinning in the case of oold houses or wall cases greatly increases the size of the fruit retained. Ventilate the houses very early in the morning, and close them early in the afternoon so as to raise the temperature to 80° with sun heat, and open the ventilators a little before nightfall. In late houses it is particularly desirable that the trees be kept well pruned and closely tied in.

*Cherry House.—After the fruit is gathered the chief object is to secure the swelling or development of the buds by keepin

Cherry House.—After the fruit is gathered the chief object is to secure the swelling or development of the buds by keeping the foliage free from every description of insect pest, syringing abundantly, and if necessary apply an insecticide, as it is of the greatest importance that the foliage be kept clean and healthy. Although less moisture is necessary than when the fruits are swelling, yet it is necessary that there be sufficient moisture at the roots to maintain the trees in a healthy state. Trees in pots from which the fruit is gathered may be placed outdoors in the full sun, plunging the pots in ashes; water as required to keep the soil moist, and syrings in the evenings of hot days if there are any.

Cucumbers.—The weather has not been favourable to the Cucumber, there being an almost total absence of sun, resulting in a

plentiful crop of yellow fruits, together with mildew in the foliage and canker at the collar, and in some instances gum in the shoots. It is necressary to still continue gentle fires, especially at night and on dull days. For mildew there is nothing better than flowers of sulphur, and for canker fresh-slaked lime. After dull weather there is more necessity for shading than when the days are successions. sively fine, as the foliage is more flabby; therefore shade upon a return of bright weather so as to prevent flagging, which not only destroys the energies of the plants but is liable to result in soorched leaves and stunted fruit, with subsequent attacks of red spider. Pot off the plants for autumn fruiting, in due time piaching out the growing point above the second rough leaf if the plants are for growing in pits; but for trelliswork place a small stick to each, securing the shoot as it advances. Prepare the soil so that the plants may be placed out when ready, the house or pit being previously thoroughly cleaned. In pits and frames the growths must be regularly looked over cutting out those that are exhausted, training and earthing-up the plants as may be required, sprinkling overhead at about four o'clock, or on showery afternoons the lights may be removed for a short time.

PLANT HOUSES. Store.—The numbers of table plants now required, and also for the decoration of rooms, halls, &c., make it necessary to grow some of the most useful and effective for the purpose, and as some of the most useful and effective for the purpose, and as most of the plants used for such purposes are not required large it is necessary to keep up a continuous supply. Most of the Dracenas are available, such as D. elegantissima, D. terminalis alba, D. gracilis, and D. Cooperi. Crotons are useful, especially C. Johannis, C. Weismanni, C. angustifolius, C. Challenger, C. Hanburyanus, and C. Earl of Derby. The Screw Pines are very effective, such as Pandanus Veitchii, P. utilis, P. graminifolius, P. grantinifolius, P. graminifolius, P. graminifolius, A. Rajis elegantissima. P. ornatus, and P. javanicus variegatus; Aralia elegantissima, A. leptophylla, A. pulchra, A. Veitchii, and the var. gracillima are unrivalled table plants. Few surpass the beautiful Curculigo recurvata variegata. Cyperus laxus and C. alternifolius variegatus are also useful, and the merits of the Indiarubber (Ficus elastica), and the variegated F. Parcelli are well known. Some of the best and the variegated F. Parcelli are well known. Some of the best Palms are Cocos Weddelliana, Thrinax elegans, T. argenteus, Demonorope plumosus, D. fissus, Geonoma gracilis, Kentia gracilis, Chamcedorea graminifolia, C. Ernesti-Augusti, C. elegantisaima, Hyophorbe indica, and Euterpe edulis. All have persistent foliage, and with ordinary care will be available for a lengthened period, it being important that they be well prepared and have the growth sufficiently hardened before being employed. Similar remarks apply to Ferns, such as Adiantum cuneatum, A. gracillimum, A. formosum, A. trapeziforme, Asplenium laxum pumilum, Lomaria gibba, L. discolor bipinnstifida, Davallia Mooreana, and D. paryula. Neohroleois Duff. Pteris serrulata and vars. ana, and D. parvula, Nephrolepis Duffi, Pteris serrulata and vars., P. cretica albo-lineata, few plants being finer for this purpose than Selaginella cæsia.

FLOWER GARDEN. The pricking-out of hardy perennials and biennials must be attended to as the plants become fit, so as to have them sturdy. strenged to as the plants become fit, so as to have them sturdy. Seeds may yet be sown of most perennials and biennials, but the earlier the better. The propagation of plants for spring bedding should be proceeded with, and such as are raised from seed, as Silenes and Myosotis, must be sown at once. Seedling Pansies may be planted out where they are to flower, also inserting cuttings and saving seed from the best flowers. Prick-out seedling Polyanthuses and water them in dry weather. Layer Carrations and Pictors as soon as the short weather. Layer Carnations and Picotees as soon as the shoots are long enough. Carnations and Picotees as soon as the shoots are long enough. Gladioli are looking very sickly, probably owing to the cold and wet—bright weather is particularly desirable just now. Zinnias and Asters required to produce extra large blooms should have the buds freely thinned and receive plentiful supplies of liquid manure. Dahlias and Hollyhocks as well as subtropical or other plants with a large leaf surface must be securely staked and tied and supplied with liquid manure. Roses, too, will be greatly benefited by similar treatment, which will induce them to make freah growth strongly for autumn flowering, cutting off all decaying flowers and flower stems. Shorten back the strong barren growths, keeping the growths free from insects by washings from growths, keeping the growths free from insects by washings from the garden engine, and if need be apply an insecticide such as soft soap 8 ozs. to the gallon of water, with a pint of tobacco juice to each gallon, and against mildew dust with flowers of sulphur.

TO CORRESPONDENTS.

BOOES (R. P.).—The work you name is sound and reliable, although it does not include such modern practice as carpet bedding. Not knowing the subject on which you specially require information we are unable to give you a more explicit reply. The question for you to decide is whether a number of smaller works on special subjects would not be more useful to you than one or two bulky and expensive volumes.

THE LIVERPOOL HORTICULTURAL ASSOCIATION (C. C. H.).—The name ad address of the Secretary is Mr. David Thomson, 69, St. Albans, Everton, Livernool.

CLEMATIS JACKMANI (J. G.).—It is not an herbaceous plant, but a scidnous climber.

ROBE UNHEALTHY (Mrs. H. T.),—Poverty of soil is the chief cause of the Mage being so unestisfactory. If you remove the old soil from the roots

and apply a compost of half loam and half manure, and give liquid manure and apply a compost of half loam and hair manure, and give inquid manure copiously, the Rose will, we think, produce healthy foliage and fine blooms. Roses planted near walls generally suffer by drought at the roots. The abnormal growth of the Geraniums is the result of the wet and dull season. With finer weather the plants will grow and flower in their usual natural

NICOTINE SOAP (A Constant Subscriber).—It can be obtained from Messrs.

Corry & Soper, Shad Thames, London, E.C. In pronouncing Clematis mphasis should be placed on the first syllable "Clem," the "a" following aving a very short sound.

GERANIUM MOLLE AUBEUM (J. S. S.).—You have been rightly informed that there is what is termed a golden variety of Geranium molle. There is a small bed of it in Battersea Park, the foliage being a greenish yellow, but will perhaps become brighter with brighter weather.

FUNGUS ON FERN (Exex).—The Fern is, we think, Cystopteris fragilis var. Dickieana. Since we received your specimen we have seen at Coombe Bank a plant of the Fern mentioned attacked in precisely the same manner as yours is, and the fronds are turning brown, the surrounding Ferns being quite free from fungus and perfectly healthy. Removing the worst fronds and applying sulphur to the others is the only remedy we can suggest.

GRAPES WITHERING (Lodge).—The example you refer to as having been sent must have been lost in transit, as we could not find it in the letter. If you will send a small bunch of the Grapes and some particulars of the conditions under which the Vines are grown we will endeavour to assist you. You will find the names of plants below.

CUCUMBERS UNSATISFACTORY (W. Criek).—The exudation from the sap from the fruit and rupturing of the cuticle is due in a great measure to the absence of sun, the leaves of the plants being unable to elaborate the sap. As the weather improves so will the Cucumbers; but in the meantime the foliage should be so trained that every leaf is exposed to the light, a moderately high temperature and not over-moist atmosphere being maintained, the plants at the same time only having sufficient water to keep them in a fresh healthy growing state, an excess of water at the roots being under the circumstances very prejudicial.

circumstances very prejudicial.

MELON FLANTS GOING OFF AT THE COLLAR (L. L. D.).—The cause of this is difficult to explain. Some attribute it to one thing and others to another; but the chief reason in our opinion is the watering overhead and shutting up closely at night, which cause the vapour to condense, and this so charges the parts with moisture that ulceration of the stem takes place. It not unfrequently happens that the canker or ulceration of the stem follows a close pruning, or the removal of a considerable quantity of foliage accompanied, as it very often is, with watering. This so gorges the plant with sap that it comes from the cut parts, and this exudation is followed by the decay of the stems and ulceration at the collar. The only effectual remedy is to keep it dry, giving a little air at night so as to prevent moisture condensing and dripping on the stems. In and after August Melons in dung frames do not require frequent supplies of water, and at no time should large removals of the foliage be practised, but stop the growth frequently so as to render such removals of leaves unnecessary.

MAGGOTS ON MUSHROOMS (H. S.).—Mushrooms are usually maggotty in

MAGGOTS ON MUSHROOMS (H. S.).—Mushrooms are usually maggotty in summer. Excessive heat is the cause. There is no cure, and the only preventive is to keep the house as cool as possible by ventilation during the night and early morning, and keeping the floor, &c., damp during the day. Mushrooms succeed better in cool shady places out of doors or in cellars during surper than the houses. during summer than in house

ISMENE MACLEANA AND TUBEROUS BEGONIAS (A Constant Subscriber).—Plants of the former should be taken up in the autumn when the foliage is decaying, as they require rest during winter. A sandy soil is most adapted to their requirements, and with the above treatment you will no doubt succeed in obtaining flowers. Watering Tuberous Begonias with liquid manure must be determined by the character of the soil in which they are planted. If it is poor the plants will be benefited by a little assistance after they have become established. ISMENE MACLEANA AND TUBEROUS BEGONIAS (A Constant Subscriber).

PRIMULA DENTICULATA TREATMENT (O. S. Roberts).—The plants that were divided and potted in spring should, after flowering, be kept duly supplied with water and be placed in a cold frame on a north border, or shaded from bright sun and freely ventilated. They will also succeed with the pots plunged in ashes on a north border, where they should remain until autumn and then be placed in a cold frame, removing them to the greenhouse in spring. The trusses of bloom now appearing should be removed. In the open ground this species does not require different treatment from other Primulas grown as border plants.

INARCHING VINES (A. R.)—All the Vines you name will form suitable.

INARCHING VINES (A. B.).—All the Vines you name will form suitable stocks for the Black Hamburgh. The operation must be carefully performed so that the union may be complete some time before the fall of the leaf, and it is best done early so that a good growth can be made afterwards.

It is best done early so that a good growth can be made atterwards.

ARRIAL ROOTS ON VINE RODS (Albert C. C. Henry).—The skirlal roots are evidence of defective root-action, and may be due to the cold and wet of last winter having acted injuriously on the roots in the border, and as the spring and summer have been cold and wet, sufficient fresh roots have not been produced to meet the requirements of the foliage. Do not remove them, at least not until the Vines are in better growth, and then do so gradually. The drainage being good, roots will form when the soil becomes warmer, and to retain it the outside border should have a good covering of dry protective material early in autumn. material early in autumn.

EXUDATION FROM ARAUCARIA (D. W. P. B.).—We have noticed this

EXUDATION FROM ARAUCARIA (D. W. P. B.).—We have noticed this before and also in other Coniferous trees after a severe winter, and it may be a result of the frost causing an undue expansion of the bark. No injurious results are likely to follow, at least we have not noticed any.

SOWING AUCUBA BERRIES (An Old Subscriber).—Sow the berries as they are in sandy loam, covering them about haif an inch deep, and place the pots in gentle heat, and when the seeds have germinated remove the pots to a light position in a cool house.

PEACH AND NECTARINE TREES FOR SUCCESSION IN COLD HOUSE (Journal Reader).—Peacher: Early Beatice, Early Alfred, Hale's Early, Rivers' Early York, Dr. Hogg, Early Grosse Mignonne, Dymond, Merlin, Migdala, Alexandra Noblesse, Calande, Royal George, Grosse Mignonne, Noblesse, Violette Hâtive, Bellegarde, Barrington, Prince of Wales, Late Admirable, Raymackers, Stirling Castle, Golden Eagle, Walburton Admirable, and Lord Palmerston. Necturises: Lord Napier, Murray, Riruge, Violette Hâtive, Pitmaston Orange, Pine Apple, Hardwicke Seedling, Balgowan, Humboldt, Albert Victor, Prince of Wales, and Victoria.

NAMES OF PLANTS (Desprission)—1, Spirms tribols; 2, Erigaron purpusum; 3, Ægopodium podegraria. (Darsen).—1, Leptosparmum triboralize; 2, Mesembyanthansum tensifolium; 3, Sodum carneum variegatum; 4, Cytisus racemesus; 5, Celais crutics; 6, Pelargonium ardens; 7, shed all its petals. The numbers ettached to spacimens sent for identification should always be affixed so that they can be seen without untying the ligatures. (C. C. E.).—Salix pentandra. (A. M.).—1, Diplacus giutinous; 3, Socymboss; 4, S. bella. (Lodge)—1, Davallia elegans; 2, Asplenium Adiantum-nigrum; 3, Fancratium fragrans; 4, Hems-rocallis flava; 5, Agapanthus umbellatus variegatus; 6, Selaginella costis; 7, Coleus pictus; 8, specimen insufficient. (R. F. Wheeler).—1, Sempervirum Braumi; 2, Sedum reflexum; 3, specimen too small; 4, Sarifraga carinthiacs; 6, S. Hestii; 5, Mesembryanthenum falciforms; 7, Sempervirum finbriatums. (G. O. S.).—The specimes resembled a Tradescantia, but was too withered for identification: (C. T. H.).—1, Polypodium Phymatodes pelticleum; 3, Doodia aspera. (Aurora).—Fabiam imbricata. (J. S. S.).—The sepals had fallen from the Clematis, but we think the variety is Miss Bateman. (X. T.).—Tour best mode of obtaining the names of your Rosss is to compare the blooms and habits of the trees with others in a named collection. It is impossible for us to undertake the naming of large numbers of varieties of Rosse or other florists flowers. (Varieus).—We have this week received two collections of plants to name without a line in reference to them being either enclosed with the flowers or received by letter; also a box of sprays of flowers without any numbers attached. (South Wales).—18, Begonia ferrugines; 14, B. Weltoniensis; 15, B. Ruchsioldes; 16, B. lucids; 17, B. Ingrami; 18, B. parviflora; 19, Justicia species; 20, Asclepias species, but flowers to expanded; 21, Panax longifolium. The Ferns you must send exparation impossible without tearing the numbers: besides, we do not undertake to name more than six specimens at one ti

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

SUBURBAN VILLA FARMING.

(Continued from page 86.)

BEFORE entering upon the subject of buildings, &c., at the farmery there are some incidental matters relating to the general management of the villa grounds, gardens, buildings, dairy work, &c., which we must not overlook. For instance, where the whole occupation extends over twelve acres there will be the general superintendence to be provided for. The head gardener may very properly be considered the responsible person, and if he has a general knowledge of farming matters so much the better. If a bailiff is kept to look after the cultivation of the land and pastures and the cattle entirely, well and good; but there would in this arrangement be one objection-that is, divided responsibility to a great extent, which never answers a good purpose. Therefore we advise that the gardener be made responsible for all matters, including keeping the accounts, &c., unless, as sometimes happens, the occupier or proprietor of the villa takes sufficient interest and pleasure in the general management to exercise an active supervision.

There is yet another matter to be considered relating to the dairy work-whether the milk should be taken to the villa night and morning and a dairymaid kept, or whether the gardener's or carter's wife should be required to manage the dairy work at the farmery. In the latter case a dairy room must be provided at one of the cottage tenements. We can recommend the latter as being the best arrangement, for, having been agent upon estates where it has been carried out both ways, our experience tells us that it is now very difficult to obtain a servant at the villa who would engage to make dairy work a part of the daily duties. We have taken into consideration the various points, knowing how difficult it is to secure people fit for the duties required in the suburban districts, where the demand for all kinds of labour exists at high wages; and we find that the only way is not to depend upon casual labourers, but to secure the services of steady and industrious men with families, and furnish them with a comfortable cottage residence at liberal wages. Although we have thought proper to illustrate our subject by adopting the extent of the villa farm as twelve acres, in those cases, however, where there are only a few acres of pasture and no arable land, if there should be a large garden and orchard attached these under spade culture may be made to produce vegetable food enough for the small number of live stock which would be required upon a limited area.

In referring to the buildings at the farmery for the accommodation of live steek, we shall at present only allude to them as

if they were not required to be newly erected, and by so doin it will be probably the best guide for the alteration or adaptation of old buildings for new purposes. The first matter which we of old buildings for new purposes. The first matter; wi have to recommend is a shed for shelter and shade connect the pastures. As, however, an ordinary elongated hovel is but poorly adapted for the purpose we will endeavour to explain a shade and shelter of our own design, which on several esta met with the approval of the proprietors. It need not be an unsightly object in the pastures, but, on the contrary, may be ital if required. For paddocks or small made somewhat orname pasture enclosures we advocate an hexagonal shed about 20 fe across containing three divisions, one of which, facing the north, across containing three divisions, one of which, is ning the house, serves the purpose of shade in hot sunny weather; the other won, one facing south-east, the other south-west, are both intended for shelter during temporary storms, which often happen in our climate during spring and autumn. This building may be placed. where two or more pastures or paddocks join; and in order that cows or horses may have access when requisite the building is surrounded, or partly so, by iron cattle hurdles, one of which removed at any time enables the animals to enter for shade or shelter as the case may be, which they can easily do when the divisions of the paddocks radiate from the circular fence. We submit a ground We submit a ground plan (fig. 6) and also elevation (fig. 7, page 58) of the shed, the dissensions being 20 feet across on the ground plan divided into these

portions; the partitions, which are beanded, are carried up to the roof to prevent any current of air inside. The floors of these compartments are sunk I foot below the ground level, in ordstat they may be filled up level with dry coreened earth, sahes, or peat mould for the absorption of urine and for future uses as manure, the solid droppings of the stook to be removed to the manure heap as cleanliness dictates. The entrance to the compartments is by openings or doors 3 feet in width; the height of these shed up to the caves is 7 feet and boarded up. The roof (see pages 18), however, be made with various materials if thought to look-more ornamental. A manger for feeding or trough for water maps be added if necessary. Where, however, we have buildings at the farmery properly constructed this is scarcely necessary.

We have now to consider the construction of buildings to accommodate the live stock, the nag stable, the cart horse stable, the cow pens, and also the pens for awine. As, however, we argate at a future time to furnish our readers in these columns with designs and descriptive plans of buildings for maintaining all the animals of the home farm in health and comfort, not forgetting the saving of manure in the mest valuable condition, we shall now only refer to the description of buildings which may be sufficient to enable readers to impreve any accommodation they now possess. We recommend that the stable for nag horses and cart horses also should face the north-west; and in consequence of our disapproval of the ordinary stable accommodation with its brick or stone floor, its drain and sink trap, tank, &c., and its concomitant disadvantages, including the tethering of the animals, we have for many years adopted the plan of boxes instant The size of box we prefer is 12 feet by 18 feet, excavated 2 feet in death below ground level, and filled with fine day earth ramment death very firmly—hard, the divisions of boxes to be beauted.

7 feet in height. Such a box will answer the purpose for one horse at liberty or two horses tethered, and with the earth floor there is a great economy of straw, very little being required, as the urine will be absorbed and the solid excrement only will require to be removed daily. If one house only is kept in the box the earth that will not require to the contract of the contrac removed Gally. If one noise only is kept in the ook the earth above will not require removal for several years; in any stable with drillnery ventilation the air will always be pure, and the earth asser will afferd the best lying and standing. The liberty also the animal enjoys in a bex is most important, and we recken that horses thus provided for will last three years longer than when stalled in the ordinary way. The bexes for cows and pigs should have the south. The same made of management as just described face the south. The same mode of management as just described will apply with equal advantage for cows, only the boxes need not be more than 10 feet by 10 feet, and may be divided only by three or four hollow iron bars or wooden rails. The boxes or pens for pigs may be of the same dimensions, and should be entirely under cover with wood fence and wicket at front 5 feet high, thus leaving an open space of 2 feet up to the eaves for light and air; the divi-sion of pens to be of iron rods 21 inches apart, the floor of the pens to be excavated 18 inches and filled with earth 8 inches deep, and the manure allowed to accumulate, the dung to be spread over the pens daily, and also fine earth or sand, and the pigs properly rung to prevent routing, and the consequent heating of the mass of manure, and only littered with short straw as cleanliness requires. The cow boxes and pig pens being in one range, a 4 feet wide feeding path will be convenient for both. It will be readily seen that in the plans we have endeavoured to describe there will be great economy of straw for litter, an item of consequence where none is grown, and also that the health of the animals is insured as far as possible, and the manure made of the best quality; at least these are the results we have obtained in our own practice.

WORK ON THE HOME FARM.

Herse Labour.—Up to the time we are writing it has only been at intervals that the horses have been able to continue the tillage and seeding for turnips, rape, &c. Fortunately the planting of cabbage of sorts, including the Thousand-headed kale, has filled up the time, which would have been lost while waiting to drill the seed of turnips, &c., on account of the succession of wet and stormy weather. Wherever farmers have provided for cabbage or kehl-rabi plants by making seed beds last autumn or spring, or whenever they can purchase plants readily, this kind of work may proceed in spite of the weather if it is done by setting the plants as fast as the land is ploughed; and when the dung for these crops has been laid out and spread it need only be done when the crops has been said out and spread it need only be done when the weather is adverse for ploughing and drilling on the fallow preparation. The planting of cabbages, &c., must be approved upon all land where green crops have been cleared, for although there is a little more expense in planting than in tillage and seeding for roots, yet there is a much greater certainty of the crop taking if properly planted; the plants are sure to here and succeed be the er too wet or too dry for seeding. Besides, the drilled seed may not vegetate, the infant plants may be attacked by the fly, may not vegetate, the infant plants may be attacked by the my, and later on by wireworm, and last of all by grubs; but when cabbages are set preperly they are proof against all enemies. There is another point in favour of planting such crops—viz., a gain of a month or five weeks as regards time if the time of planting is compared with the time of drilling. This wet summer has been much against the making of fallows, but in case of fallows for the analyzant and more cloddy the for the autumn sowing of wheat the rougher and more cloddy the land is kept the better, and instead of dragging, rolling, and harrowing let the land be continually cross-ploughed as soon as the weeds make their appearance. This applies more particularly to strong and heavy wheat land, as it exposes a greater surface to the action of sun, wind, and rain, and these alternations of weather are beneficial so long as the ground is rough; but as soon as the land is worked down fine it begins to suffer immediately from any excess of moisture. On the other hand, when the sun is all-power-

ful the soil is not much benefited if it lies smooth and level.

Hend Labour.—Large tracts of pasture land in the various counties and climates of the kingdom have not yet been cleared of the key crop, although the mowing machine and other labour-saving machinery have been in full operation, and in a season such as we have lately experienced the crops of hay have been said as we have latery experienced the crops of hay have been surficiently injured. Every device which practical intelligence can turn to account has been adopted, yet when the weather proves adverse really good hay cannot be made. It then becomes a question what is the best course to pursue after the hay has been washed and discoloured by rain, for it has lost its aroma possible. we have often seen it do more harm than good, for in the event of the slightest amount of water being in the hay at stacking time the application of salt is sure to make it musty and comparatively useless, but when perfectly dry it may be and often is better folder; still there is no aroma to attract and induce cattle to eat it. There is, however, another view of the subject—that of spicing the hay as it is stacked, which certainly tends to improve not only kay damaged by rain but also hay made from inferior pastures, where the herbage is naturally sour and course. The superiority of spice as compared with salt is that it gives the hay

an attractive smell as well as an improved flavour, and yet the cost is not more than 2s. 6d. per ton if Simpson's spice is used. We have abundance of evidence from practical farmers with whom we are acquainted that its use has in past seasons not only whom we are sequentiated that its use has in past seasons not only been advantageous generally, but has surpassed their expectations as to the way in which cattle and sheep have eaten the hay and made good proof upon it. The farmers in the lowland pastures must bear in mind the result of last year, where large numbers of sheep bear in mind the result of last year, where large numbers or sneep were lost from the coathe or rot, and this is always the result more or less of a wet and stormy summer. It is easy to be prepared for the emergency where the farmer occupies arable land as well as pasture, because not only do the sheep suffer from eating grass the produce of wet pastures, but from taking into their stomachs the entosoa which are the cause of the parasites found in the sheep's liver. It may, however, be provided against, as it is well known to us that the animals if kept in the same lowland mastures night and day may suffer from the rot in such seasons as pastures night and day may suffer from the rot in such seasons as last year and the present; but they do not suffer from the fact of taking in the entozos into the system if the animals are allowed a liberal allowance of vetches, clover, mustard, saintfoin, &c., once a day, and made to lie upon the arable land at night.

PLOUGHING BY ELECTRICITY.

Two French gentlemen, Messrs. Chretien and Felix, who are engineers by profession, have lately been making a trial of ploughing by electricity at Sermaize in France, not far from Paris. The mechanical power which is generally employed in England has for its base the employment of steam ploughing machines, which are taken to the fields and worked by the action of drums on which are enrolled wire cables, which draw ploughs with several shares. The cost of this machinery is considerable, and the cost of superintendence and maintenance are equally dear. They require special care in looking after, and they are also require a considerable quantity of water to be carted. The work, however, is better done and the cultivation deeper than with horses. But the steam plough is by no means general in France, on account of the land being divided into such small

pieces, and of the above inconveniences.

Mesers. Chrétien and Felix, struck by this state of things, and having known for some time the remarkable properties of the Gramme machine, which has become familiar through being used along with the Jablockoff candles for lighting the Thames Embankment, the idea occurred to them to utilise it as a generator of force. Powerful Gramme machines produce a considerable quantity of electricity, and it is this electricity conducted at 1000 or even 2000 metres (the metre is rather more than a yard) by means of metallic cables, which communicate the movement to other Gramme machines directly coupled with the pulleys drawing the ploughs. Thus under this simple gift of the easy transport of motive force or electric power (I coin the word) to a distance the inventors have combined a series of mechanical gear for ploughing, threshing grain, the unloading and loading of mer-chandise, harrowing, weeding, sowing, and, in general, for all the operations of the farm usually executed in England by means of locomotive engines. Two of these works have already been established and experimented on at Sermaize—one a lift for the discharge of beetroot from barges, and a double pulley for ploughing.
In the French "Agriculture Pratique" to which I hereby express

my acknowledgements, there is a drawing of a field with the electric ploughs at work. At the first glance it looks very much like a double system of Fowler's steam ploughs on a small scale

at work; but when you look at the engine more closely you do not see any funnel, and the space usually occupied by the boiler is occupied by the Gramme machine, wheels, dr.

This invention is quite in its infancy at present, having only been started a few weeks, and therefore we must expect that further improvement will still be made. They only work two shares at present in the plough, but are increasing the power of the machines. Whether the invention is likely to become a finan-cial success as well as a practical one within a reasonable time, no doubt we shall soon be in a position to judge.—FREDERICK BRAVENDER, Cirencester.

POULTRY FARMING .- No. 3.

WE come to the particular points to be considered before any attempt should be made to keep poultry on a large scale. The first of these is soil. For those who have a farm or other land, first of these is soil. For those who have a farm or other land, and who only wish to add poultry to their other stock or to improve and increase their stock of poultry, the only thing to be done is to make the best of the soil upon which they live. We can give much encouragement to those who live even upon heavy soils, generally believed to be most prejudicial to poultry. We have had experience of keeping feathered stock on various kinds of had, and believe that with good food sensibly administered, and dry well ventilated houses, poultry can be made to thrive on almost any soil. When, however, land is to be selected for poultry farming its choice is of the greatest importance, and that quite as much for the sake of the land itself as of the birds. The good done to some soils by being heavily manured by poultry is wonderful, and fortu-nately these soils are those on which poultry thrive best, and on which the greatest number can be kept in health.

which the greatest number can be kept in health.

The first principle in any large poultry establishment should be to combine the cultivation of vegetables with that of birds. Light soils, especially newly reclaimed sands, are made extraordinarily productive by the sweepings of poultry houses. We have known the whole character of a poor kitchen garden changed by being thus continually dressed. In such soils, too, grass is wonderfully improved in the same way; it seems that the coarser grasses are destroyed, while all the finer ones are brought to perfection. Some years ago we divided out a rubbishy neglected piece of ground newly planted with fruit trees into poultry yards. Nothing was sown in the ground, and for a while the yards looked bare and untidy. Au sbundant crop of weeds and rough grass soon came up; this we had mown occasionally, and took eare that no yard was overstocked with tenants so as to be trampled down. Now and then, too, the birds were removed for a few

was overstocked with tenants so as to be trampled down. Now and then, too, the birds were removed for a few days and some seeds from the hayloft scattered about, but there was never any kind of systematic sowing of the ground. In three years the turi was the admiration of all who saw it, and in a bad grass country was closer and finer than any that could well be found in the meadows. We know, too, of another instance in the same soil where the regetable garden and poultry yard have with great advantage been transposed, as the latter had been over-populated and was becoming tainted. Our idea is, that success in keeping poultry on a large scale depends mainly on its judicious combination with the growing of vegetables and cultivation of grass, and upon the proper distribution of the birds over a considerable tract, so as to manure the ground sufficiently without its being tainted; at the same time the chance of epidemics among the stock ground sufficiently without its being tainted; at the same time the chance of epidemics among the stock is greatly lessened by their constant change to fresh quarters. The refuse and enperfluous vegetables, too, should supply a considerable item of the food. We lately translated some extracts from a French poultry book with the express purpose of pointing this out, and of calling attention to a fact much forgotten among us, that the natural food of gallinaceous birds consists to a great degree of vegetables.

When land is to be selected with the express purpose

sists to a great degree of vegetables.

When land is to be selected with the express purpose of poultry keeping, there is, in our opinion, nothing better than unreclaimed heath and grass; if there is low underwood about it, and here and there trees, so much the better. From our experience of the effect of poultry on such ground we feel confident that those who possess it, and would have it gradually reclaimed and enriched, would be wise to let it rent free, of course under certain conditions, for a few years for such a under certain conditions, for a few years, for such a purpose. To begin with, it should not be broken up, but the roughest heather and grass cut and cleared

purpose. To begin with, it should not be broken up, but the roughest heather and grass cut and cleared away; parts where there are any trees had better be left for cover. Heath, when once cut, if poultry are put upon it, soon begins to dechne, and grass gradually takes its place after one season; but the whole should be trenched over and the birds removed for a while, good grass will then rapidly spring up in the manner we have described. Climate and position form another question, and intimately connected; we believe the latter to be of more importance than the former. We should certainly not advise anyone to attempt keeping a large stock of poultry in a climate known to be at once cold and wet. Certain breeds may be kept with profit in cold dry counties, and we are strongly inclined to think that almost all breeds will thrive in warm moist situations. It is generally believed that a very dry atmosphere suits poultry; we are persuaded it does not. We have only to look at the poor stanted fowls, layers it is true of good ergs, to be seen everywhere on the shores of the Mediterranean, to learn that such a climate is not favourable for their development; on the bother hand we have often been struck with the fine birds head in some of the wet south-western counties of Scotland. Again, we have seldom found our own stock reared during very hot summers turn out well, and we hear on all sides in the south of England of chickens doing and growing particularly well through this hitherto very wet summer.

The position of yards relatively to hills, woods, walls, or any kind of shelter is of the utmost importance. Those who live in hilly conneries, or where woods and have land alternate, know well the extraordinary difference of temperature there often is between places only a few hundred yards apart. This is specially the case in spring, when the winds are cold and the sun is bot. The southern side of a bill or wood, even of a bank or hedge, is then often through mid-day like the south of France. An hour's back daily in s

fetch three times as much as they do in the summer. The birds too, do not consume nearly so much food in a sheltered position. One of the great ends of food is to supply heat to the system, and if

of the great ends of food is to supply heat to the system, and if this is supplied from another source so much less food is required. Our advice, then, generally to one looking out for land on which to keep poultry largely is to seek for light sand or chalk, with some wood, if possible, not in too dry a region, and as far as may be well sheltered. Poultry hate wind, and if they are not sheltered from cold blasts by natural features of the country, must be artificially protected by hedges, banks, or paling.—C.

THE POULTRY CLUB.

A COMMITTER meeeting of the Poultry Club was hald on Wal-

hed as shelter for stock (see page 56).

nesday, July 2nd, at the Charing Cross Hotel; present the Hon. and Rev. F. G. Dutton, A. Darby, S. Mathew, and O. E. Cresswell. Hon. Sec. The following were elected members:—T. W. Anen, 42, High Street, Clapham; W. R. Fitt, Wyke, Winchester; C. Naylor, Newtown, Montgomeryshire; Leonard Pilkington, Veroes Lodge, Gateacre, Liverpool; Butler Smith, The Grove, Cropwell Butler, Bingham, Notts; and associate member, J. Castlemas Brown, Arnold Hill, Maidstone.

Monsieur Eugène Mennechet of Amiens, President of the International Jury for Poultry at the Paris Exhibition, was elected an honorary member of the Club.

A complaint having been made against Mr. John E. Claydon of

an honorary member of the Club.

A complaint having been made against Mr. John E. Claydon of Shadyoak, Offerton, Stockport, an associate member of the Club, of his not having paid for some Houdan hens which he had purchased, the Secretary was instructed to ask for an explanation, and no answer having been returned to the Secretary's letter, the Committee decided to expel Mr. Claydon from the Club.

The following members who

Committee decided to expel Mr. Claydon from the Club.

The following names of members and associate members who had failed to pay their subscription were struck off the list of the Club under Rule 4 — F. Beanmont, Ipawich; S. Field, Thame; J. H. D. Jenkinson, Sheffield; Rev. G. W. Joyce, Farnham; G. Mumford, Weymouth; J. F. Newall, Littleborough; A. Ogden, Ashton-under-Lyne; F. Perrin, Feckham; A. H. Schofield, Littleborough; and J. Thomas, New Kent Road.

The question of the disqualification of Mr. G. Burnell's Malay cock at the Shrawsbury Show was further considered, and it was resolved, that "After consideration of a letter from Mr. R. Hewitt

on the subject of Mr. G. Burnell's Malay cock disqualified by the Committee of the Shrewsbury Show, the Committee of the Poultry Club came to the conclusion that the case does not appear to be one calling for their censure."

Various other businesses were transacted, and a number of letters addressed to the Hon. Sec. on subjects connected with the

Club were read.

DISEASED SKIN IN BELGIAN CANARIES.

This subject is one of importance to others besides a correspondent, J. P. Allan. Irritability of the skin of Canaries is caused in various ways, sometimes through an overheated temperature, or the bird having been stuffed and made too fat with egg, cake, and sugar, which produces a gross condition of the system, with sometimes a tendency to a scurify skin if the birds have been kept without proper green food and fed freely upon hempsed at a season of the year when it is not of such service to them as in the depth of winter. Cages, too, are frequently infested with parasites which trouble the birds at night time, robbing them of both blood and rest. The above all tend to encourage a bad state of the blood—a sure precursor to irritation of the skin. If there be any scurf upon the necks of birds very slightly anoint the bare places with lard, and at the expiration of a week wash any infected bird with soap and warm water, well rinsing the soap from the feathers, and drying-off before a fire. For birds kept in a close atmosphere a wash now and then is a preventive against disease. Whenever the operation is performed use care; a soft shaving brush or piece of old fiannel are best to wash with. We use a camel's-hair shaving brush for the purpose. If birds are over-fat diet them for a few days with rapeseed, lettuce, or the seed of the same will act as a slight purgative, and assist to carry off any ill-humour the birds may have contracted. Do not give the birds groundsel; at this season of the year it would have been beneficial had it been well ripened with the sun. Cleanliness in every respect should be studied, not only in the birds' seed being freed fresh water given daily, and a bath at least three times a week. Fresh water daily is a most important adjunct in keeping birds in good health. Where several birds are kept in a cage, and all have access to one drinking vessel, the water soon becomes stale and impure, which may easily be found out by testing it with a sniff of the nose when the water in the vessel has

VARIETIES.

PROBABLY at the Kilburn Show the attention of some of our readers was directed to a machine for fattening poultry. It is a huge circular thing which turns on a pivot, and all round it are tiers of receptacles for chickens, into the crops of which food is periodically pumped. We saw it, or a similar machine, at the Paris Exhibition; but there the tenants of the tiny pens were wooden cocks and hens. Not so, unfortunately, at Kilburn, where a number of miserable living birds were cruelly confined in little boxes in which they could not move, and with both legs chained to the floor. A placard was placed over it to the effect that it was sold to a well-known English lady, and we trust not to be used in so barbarous a fashion. We understand that the attention of the Society for the Prevention of Cruelty to Animals has since been very properly called to the matter.

— WE have received the schedule of prizes offered for competition at the sixth Exhibition of the Caledonian Apiarian and Kntomological Society, to be held in connection with the Highland and Agricultural Society's Show at Perth on 29th of July and three following days. A silver cup and thirty silver and bronze medals are provided for competition in the various classes for honey, hives, and wax, comestibles, &c. Special prizes are also afforded for supers of honey, and for the best table display the production of one apiary in 1879. The Society enjoys influential patronage, and articles may be sent for competition from all parts of the United Kingdom. Mr. R. J. Bennett, 50, Gordon Street, Glasgow, is the Honorary Secretary of the Society.

— The Committee of the British Bee-keepers' Association

The Committee of the British Bee-keepers' Association was held in the board-room of the Society for Prevention of Cruelty to Animals on July 9th. The Judges were appointed as follows: Hives—Rev. J. D. Glennie, Messrs. Tegetmeier, Freeman, Ward, and Newman; bees and foreign honey classes—Rev. F. T. Scott, Messrs. Carr and Desborough; English honey—Hon. and Rev. C. Fielding, Capt. Kettlewell, and Messrs. Bostock, Harding, and Symington; miscellaneous classes—Rev. J. L. Sisson, Messrs. Fletcher, Jackson, Stewart, and Tite; British bee Flora—Dr. Hogg, Messrs. Ingram and Barron; and bee-driving competition—Messrs. Carr, Desborough, and Tite. The Countess Brownlow is expected to distribute prizes on the last day of the Show at Kensington,

Thursday, July 24th. On Tuesday, July 22nd, the conversazione will be held at 6 P.M.; and on Wednesday the General Meeting at the same hour, Lord Aberdare being expected to preside. A letter was read from Mr. Cowan (unavoidably absent) recommending some alterations in the instructions to the Judges at the next bee-driving competition. A discussion followed, which ended in Mr. Cheshire moving and Rev. E. Bartrum seconding, "That the bees as they arrive shall be set at liberty, and kept in the place appointed by the Committee; and that the time of the competition shall be reckoned from the moment the competitor, at the direction of the Judges, leaves the tent to fetch his bees." Carried unanimously. The Hon. Secretary trusts all competitors will have their bees on the ground not later than ten o'clock on the morning of the day of the competition. In connection with Kensington Show, arrangements are being made for a microscopical exhibition of prepared objects and apicultural curiosities generally. The possessors of such would much aid the Committee by their loan during the time of the Exhibition.

— "Some time ago," writes a correspondent from the Isle of Man, "I had a letter from a brother in Batavia, Illinois, North America, wherein he says, 'I should keep some bees here only there are too many kept just in this neighbourhood. One man alone, not a quarter of a mile from here, has 150 hives, and there are several others in town with twenty to one hundred each. Of course, honey in flowers is very scarce, so the bees go for all the ripe fruit they can find, after the manner of wasps with you. There are acres and acres of grapes grown here, and the bees make sad havoc with the fruit. The owners of the vineyards devotedly pray for the extermination of the bees and their owners. The grapes sell for 1½d, per pound. They pump the combs twice a week, and take the honey by the ton.'"

— The collection exhibited by the Lawes Chemical Manure Company, at the late Show of the Royal Agricultural Society at Kilburn, was interesting, as showing how all parts of the world are laid under contribution to provide the three essential elements of plant food—viz., phosphoric acid, nitrogen, and potash Amongst phosphates we noticed Curaços, Charleston, Canadian. and Spanish. The first named is very rich in trilasic phosphate, containing 85 to 87 per cent., and is of great use, especially for making a concentrated superphosphate for shipment when dissolved by means of sulphuric acid; it contains about 20 per cent. soluble phosphorio acid, and it will thus be seen is one of the richest phosphates known. The Charleston phosphate is the one most extensively used, however, and from this the great bulk of mineral superphosphate used in this country is made. This phosphate is taken out of seven or eight fathoms of water, and is full of animal remains which have for centuries been accumulating. Messrs. Lawes selected for exhibition a number of very fine specimens, and amongst them, in addition to the fossilised vertebre of animals we noticed sharks' teeth, shells, a large piece of fossilised wood, and a splendid and quite perfect tooth of the mastodon, which in itself is sufficient to show for how many ages this store of phosphate has been laid up for the British farmer of to-day, who finds it more and more indispensable every year, and without which it would be impossible that his crops could be grown. Messrs. Lawes had also a collection of the various nitrogenous substances, including nitrate of soda and sulphate of ammonia, dried blood, azotine, &c. They also showed bones finely and coarsely ground, and looking at the photographs of Messrs. Lawes' works, where last year nearly 60,000 tons of manure were made, we were impressed with the magnitude and importance of the industry created by John Bennet Lawes, who in his experimental fields at Rothamstead has done so much to advance the interests of scientific agric

BEE-KEEPING MADE PUBLIC.

I HAVE read with much interest the proceedings of the British Bee-keepers' Association as reported by you from time to time, but as a practical man I see a practicable mode of teaching modern bee-keeping by that Society and its affiliated societies completely overlooked. I may be mistaken, if so my ventilating the subject can still do no harm.

At the end of the work entitled "The Apiary," by Mr. Alfred Neighbour, is a picture representing an apiary as erected many years ago in the Zoological Gardens, since removed. That apiary is gone, and I have never heard of another in an English public park. Turning to foreign lands let me briefly tell you what is being done to popularise bee-keeping, but except in one instance all effort being directed to teach the modern bar-frame working. In Paris for many years past the great bee king, Professor Hamet has had the privilege of keeping an apiary in the Luxembourg Gardens, where twice a week he gave, and still gives, open air demonstrations, but as he is wedded to the straw skep system his is the one instance referred to above. But the Central Society of insectology embraoing apiculture were not content with this, and have recently acquired a large area of ground in the park of Montsouris, where they are establishing a large apiary, of which Mr. Hamet is the director. Let us hope he will include a few bar-

framers in his stock. I am glad to say he is experimenting with "Root" machine foundation which I had the pleasure of presenting him

In France there is a large and increasing school of mobilists, and in one of the favourite Parisian resorts—vis., The Jardin d'Acclimatation, this earnest school of modern bee thought has established an appary, which I visited with the liveliest feelings of pleasure last year when delegate for apiculture to the Paris Expleasure last year when delegate for apiculture to the Paris Exhibition. A sufficiently large area of ground is enclosed by a semicircular barricade about \$\mathbb{3}_t\$ feet high. Within, placed on pedestals are about a dozen hives far enough from the public for the bees to come and go, and be operated upon, without any great danger. A roomy operating house has been provided, where is the professor's library tools, &c. The professor is none other than a lady, who twice a week gives public lessons gratis. I had the pleasure of an introduction to her, and found in her an enthusiast for the proper suffers of our peter mone her frame principles. for the proper culture of our pets upon bar-frame principles. I have had the pleasure of supplying her also with foundation; and as best proof of what she thinks of it after trial I may just say she has influenced her friends to send me orders. In the north of France the Society of the Somme have an apiary of their own where weekly demonstrations are given. The Corporation of Amiens, I believe, gave the site free.

Passing southward a new Society has been started at Chartres and they are organising a public apiary, where they intend all systems to have a fair trial. Bordeaux has long been a nursery for mobilists, and the Society of the Gironde has its public apiary and open air demonstrations. Passing into Italy we find in Turin and open air demonstrations. Passing into Italy we find in Turin an apiary has been established in the public park. In Milan I think there is the same. The Municipality of Bologna, recognising the vast importance apiculture is to the trade and well-being of the nation, have proceeded in a thoroughly practical manner to do what has been done elsewhere by private effort. They have placed in the public garden of Bologna an apiary built in Châlet style, of larch, white and red wood being pleasingly worked together. Here, also, public demonstrations are given, and the on-looking peasant is brought to see that the time for the sulphur pit is past, and more profit to be gained by the rational modes of working he has actually seen.

Returning to England and its Bee-keepers' Association I would respectfully suggest that the Association take steps to follow the examples I have adduced. A little nook in that lovely subtropical garden at Battersea Park would surely be granted for such an object. Not London parks alone should have their apiaries, but the noble parks attached to English towns by munificent donors. The lessons learned by a visit to a park of an ordinary workman are many it is true; but place there that most wonderful of all peep shows an observatory hive, and his attention is arrested. For the future he sees that each flower is life to the insect world

For the future he sees that each flower is life to the insect world not merely, fine colour and perfume to please man.

If the British Bee-keepers' Association do right they will try this plan. Once begun they would find the stock would cost little; for one would present a hive, another an extractor, and so on, and amongst the bee enthusiasts of England would be found many able and willing to give two hours in the week to publicly arrivers in a roomer the modern average of management. explain in a popular manner the modern systems of management. ARTHUR TODD, Algeria.

THE SEASON AND BEES.

My bees, about which I wrote to you last week, have come to an untimely end. They were then as I thought in the greatest prosperity. I told you they were killing some drones; but in the last day or two I have seen some working bees dead, and this evening, on raising the hive, I find it as light as a feather compared to what it was three weeks ago, and the bees nearly all dead. I suppose the large number of bees, being unable to get any honey from the flowers, have been obliged to subsist on the honey in the hive, which soon disappeared. I fear it will turn out a very bad year for bees, more especially for swarms.—APIS,

SWALLOWS VERSUS BEES.

SUNDAY morning (July 7th) was very warm and the bees were as busy as could be. I and a friend were watching them, when we noticed that a swallow was evidently catching the bees and carrying them to its young in a barn about 30 yards away There were three young ones in the nest, which I killed and opened, and found that they were all full of bees' legs and wings. I have read in a work on bees that swallows are not to be reckoned among the enemies of bees, but my observations, which are supported by those of several friends, tend to an opposite conclusion.—H. SIMPSON.

OUR LETTER BOX.

PLOUGHING BY ELECTRICITY (Descrian).—You have been rightly informed that experiments on this mode of land culture have been made in France. In another column we publish a communication on the subject

which has been sent to us by an exteemed correspondent, who has given some attention to this novelty in ploughing. Your second question as to whether it is likely to answer or not can only be proved by further enperment. We can remember the time when railways were pronounced impracticable and the electric telegraph impossible.

HENS LATING IN COOP (R.).—Keep them in the coop until their obtains are old enough to take care of themselves. dves.

SMALL DUCKS' EGGS (Martan).—It is not so usual for Ducks to lay small eggs as it is for common fowls to do so. It is often caused by the food being too nourishing.

FREDING POULTRY (J. A. D., and Others).—No quantity can be stated as a standard. If any food is left in these troughs they are overfed. On the other hand poultry are often underfed. They are given, as an American states in a note before us, just enough food to keep them alive and to lay an egg now and them. It is the extra food that a bird has over and above what is required to sustain life that makes the profit in the shape of eggs or feak. Fowls should have as much food as they eat with apparant religing and more. A little maise may be given daily in conjunction with other kinds of food. A poor lean bird will eat more than one that is in good condition, and a Cochin or Dorking will consume more than a Bantam, just as a Shorthorn cow will eat more than a Kerry, or a cart horse more than a small pony. These illustrations will show how impossible it is for anyone to answer such questions as "How much food should each fowl have a day?" or "How much corn is required by six fowls in a week?"

PERCHES FOR FONTS (R B).—If they are placed \$1 toches from the

PERCHES FOR FOWLS (B,B)—If they are placed 80 inches from the ground they are as effectual, so far as the comfort of the birds is concerned, as if they were 20 feet high.

From observations taken near London during forty-three years, the average day temperature of the week is 74.6°; and its night temperature 50.4°.

THE SETTING OF GRAPES.

HERE are many causes at work to prevent Vines setting their fruit freely which we do not always discover until too late to insure success. Everything connected with their culture must be well done, and done at the right time. See that your borders are well drained, that the Vines are growing in fresh and suitable soil, and that they have been regu-

and suitable soil, and that they have been regularly and liberally supplied with water at all times. These are most important points in the successful culture of the Grape Vine. After a house is cleared of fruit the Vines should be well syringed every day,

and watered freely to retain the foliage in good health as long as possible in order to well ripen the wood. We have frequently observed strong-grown young Vines with the wood imperfectly ripened set their fruit badly, and no aid

in fertilisation would secure a good set.

Te grow a bunch of Grapes well, say for exhibition purposes, it is necessary that it be well finished. A point of great importance is, that the berries be large for the variety and uniform in size, and if more attention were paid to the setting of Grapes in our cloudy climate equal-sized berries would be more frequently seen than they are at present. The Muscat Hamburgh, one of our finest black Grapes, often sets badly when forced early as well as Mrs. Pince and other varieties, and is always more liable to fail in this respect than when grown later. We have always found the Muscat Hamburgh to set and colour better when grown on the Hamburgh stock. It is a great advantage to have the trellises of vineries so arranged that a stroke with the hand on the trellis will make the whole vibrate. A practice we always adopt when the Vines are in bloom is to give the trellis a few smart strokes with the hand every day about twelve o'clock, which causes the dispersion of the pollen. With shy-setting varieties, such as the Canon Hall Muscat, the Black Morocco, &c., while the temperature is high and the atmosphere dry, we once a day sharply tap each bunch with the finger against the upper part of the fruit stalks, avoiding the too prevalent custom of drawing the hand over the bunches, which often causes that unsightly appearance on the skin of the Grape which is called rust. We have always found it a safe rule when our Vines are in bloom to allow the temperature to be somewhat higher than at other stages of their growth, and also drier as circumstances will permit.

We have here a three-quarter span-roofed house in which Vines are planted back and front. The back border contains Black Hamburgh planted inside, while the front border Vines are planted outside, and comprise the varieties Black Hamburgh, Golden Champion, Muscat Hamburgh, Muscat of Alexandria, Madresfield Court, and Mrs. Pince. To keep this vinery as dry as desirable while in flower would encourage red spider, as the varieties flower in the order named and occupy three weeks or more. Free-setting varieties, such as Black Hamburgh, Frontignans, Alicantes, &c., should have a temperature of about 65° to 70° at night, rising to 80° during the day with fire heat, and allow-

NO. 956-VOL. XXXVIL, NEW SERIES.

ing the temperature to rise to 85°, not exceeding 90° with sun heat. The shy-setting varieties, such as the Canon Hall Muscat, the Muscat of Alexandria, the Black Morocco and others, require a higher temperature than the free-setting varieties. We succeed in setting the "shy" varieties in a night temperature of 72° or 73°, and in bright weather allowing the thermometer to rise to 90° or 95° with ventilation, always having the top ventilators open about half an inch at night. Such high night temperatures are not necessary later in the season when the days are long and sunshine strong.—John Lloyd Jones, The Mount, Congleton.

BURFORD LODGE,

THE seat of Sir Trevor Lawrence, Bart., M.P., near Dorking, Surrey, has an interest to gardeners on account of the grand collection of Orchids grown there, a collection which is being constantly increased. As there are two routes by which this garden can be reached from London, and a mistake might readily be committed by gardeners out for a holiday whereby much time might be lost, we may note for the information of all such that from the West End the London and Brighton is the quickest route, booking from Victoria station. From the City or the East End travelling by the South-Eastern is the most expeditious, booking either from Charing Cross or Cannon Street stations. Dorking is the nearest station to book to on the first-mentioned line, Box Hill on the latter. Either station is from ten to fifteen minutes' walk from the gardens at Burford Lodge. There, under the guidance of Mr. Spyers, Sir Trevor's Orchidgrower, the admirer of these aristocratic members of the floral world will for the time being find himself in enchanted ground. This is one of the finest collections of Orchids t be found in any private garden, consequently the notes which follow can only be taken as pointing out a few of the more particular specimens which attract attention when inspecting this grand collection.

Commencing with the cool Orchid house, we found in this structure a collection of the many species of this interesting section which are now in cultivation. Odontoglossum Alexandræ, O. Pescatorei, O. Roezli, O. vexillarium, O. Phalænopsis, O. pulchellum, and others of this genus were represented by plants the picture of health, a large specimen of O. vexillarium being a prominent object. Mr. Spyers considers that this species requires heat to increase the depth of colour in the flowers. The plants are standing on what we may be allowed to call a pseudo-stage of sparred woodwork, the real stage being a few inches underneath covered with spar or gravel kept wet. Besides the Odontoglots noted above as being in flower a fine specimen of the raie Restrepia antennifera had several flowers open. curiously pretty Masdevallia bella, growing in raft baskets suspended from near the roof, had each a few blooms pushed through the bottoms of the baskets. Oncidium incurvum was noted as likely to prove useful to gardeners requiring cut flowers. Several plants of the brilliant Epidendrum vitellinum were flowering profusely in one corner close to the glass. In the next division we found the rare Epidendrum Wallisii in flower. This is a very distinct and

NO. 1608.-VOL. LXII., OLD SERIES,

curiously coloured species. An extraordinary specimen of the hybrid Calanthe Dominiana had seven or eight spikes of its beautifully shaded lilac-purple flowers open. Growing in a long narrow basket the deliciously scented Aërides japonicum was producing spikes freely. Bolleas and the nearly allied Pescatoreas were in thower, the most noteworthy of which were a good plant of Bollea coelestis, B. Lawrenciana just opening its first flower, and a specimen of the rare Pescatorea Kiabochorum. Planted in a deep teak basket and suspended near the roof was a healthy plant of Vanda cærulea with two strong growths. Climbing up a piece of a Tree Fern's stem was a large piece of the sweet Zygopetalum maxillare. Potted in loam were grand specimens of Cymbidium eburneum and C. Mastersii as healthy as Geraniums. Cœlogyne barbata was represented by a large mass growing and rooting quite freely. Of the large specimen Lælias, Cattleyas, &c., in this division we have only space to say that all were splendid.

Passing on into the Cattleya house we found in bloom Dendrobium sulcatum, distinct in its shade of yellow. There were also in flower varieties of Cattleya Mossiæ, C. maxima, C. amethystoglossa, and Lælia purpurata. Cattleya gigas is here represented by perhaps the largest plant in the country. Mr. Spyers does not agree with those who think a little sun is appreciated by this magnificent genus; the Cattleyas are consequently shaded. Returning and passing into a large stove, the centre of which was filled with Palms, &c., the first plant to attract attention was an extraordinary specimen of Vanda Russelliana; then came into view three specimen Cypripediums -C. Dominianum with some thirteen spikes, each with four of the curiously tailed flowers developed; C. Sedeni coming on with sixteen spikes, and C. Parishi with nine large spikes. This latter was particularly fine. In a corner of the house was a panful of the chaste C. nævium, many of the spikes bearing each three blooms. The curiously bearded and hinged flowers of Bolbophyllum barbigerum attracted attention in passing. The equally curiously fringed and large flowers of Brassavola Digbyana are seen on a specimen growing on a block and hung near the roof. Some strong pieces of Dendrobium Wardi-anum were making their growths in the same position, with many other species too numerous to mention. The Butterfly Oncidium was represented in this house by a particularly fine variety.

Passing along a short and narrow corridor, also devoted to Orchids, a square little structure in which cool species were growing stopped our further progress in this direction. A remarkable mass of the travelling Odontoglossum Londesboroughanum growing on a sparred teak raft was the most noticeable plant. We were next shown into a house in which, amongst others, were flowering Aërides quinquevulnerum, Dendrobium M Carthie on a block, Oncidium intermedium (very distinct), and Utricularia Endresii with numerous spikes and the first flower open. An extra fine specimen of Oncidium ampliatum majus was thriving. This structure also contained the Phalænonsids.

Opening from there is a lean-to, in which was a large plant of the extremely rare Cologyne Parishi, some large Angræcums in vigorous health, Saccolabiums, and Pitcher-plants. In a frame behind are growing some large and healthy masses of Disa grandiflora, various bardy Cypripediums, &c. In a winery are large panfuls of Pleiones, specimen Anguloas, a large plant of Vanda teres growing freely, but which has not yet flowered at Burford Lodge, besides other plants. In a lean-to near this vinery are growing the Masdevallias. These are in great variety and the plants in robust health, some of the specimens being large. Many of the species have a few flowers open, Veitchiana. Davisii, and Harryana being the most striking and distinct. In a prominent position is a plant of the grand Oncidium macranthum with a fine spike fully developed. This is a beautiful Orchid, and succeeds with the coolest treatment.

We had now seen all the Burford collection. Seen all! and in the course of a two-hours visit! Not so! We felt that we could go over the same ground again and again, and every time find something fresh and interesting which had previously escaped our notice; but time and train, to somewhat alter the old saying, wait for no man, so after a glance at a range of new houses in course of construction for growing more Orchids and other plants, noting in passing that the glass was cut round in order to carry the water down the centre of the panes, and a further precaution taken against drip in having each astragal grooved just underneath the glass, we had to hurry off to the station thoroughly satisfied

with our visit, as we are certain all visitors must be who inspect this remarkable collection.—R. B. B.

SEASONABLE HINTS FOR UNSEASONABLE WEATHER.

As a matter of course much has been written lately in this and other journals under the happy delusion that sooner or later we should have some summer weather; but as I am one of those who, however much we may dislike things as they are, think it best to acknowledge accomplished facts at the earliest moment and shape our policy in accordance with them, instead of with what used to be, or with what we wished and hoped would be, I think it necessary to remind your readers that we are near the end of July; and that though we are now convinced that we can have something like wintry weather when the days are longest, there is no warrant for supposing that summer will come with the autumn equinox. On the contrary, we know from experience of former years, though there is no chance to verify it now, that the sun is already losing its power, and there is an additional unwelcome thought in the fact that it has done little or nothing to warm the soil, so that whenever the air becomes cold there is comparatively little warmth in the ground to ward off frost. Instead, therefore, of longing for summer, which if it comes to-morrow cannot in the ordinary course of things last more than a month, I should advise your readers to prepare for winter: for although I do not attempt to foretell what sort of winter may be in store for us, I can promise this much, that should it be only half as severe as the one so lately experienced we must not expect to get off with such slight damages. The sun is the best hardening factor, a hot summer is the best preparative for a severe winter, a growing autumn is the worst.

Any woody growth made after this time will under no circumstances be of any permanent use. There may be cases where it would not be advisable to remove them at once or prevent them appearing; but our principal endeavour should be to make the best of that already formed, to concentrate the energies of the plant as much as possible to the proper development of the earliest buds, for these need all the care that can be bestowed on them, and at present the outlook for next year is anything but satisfactory.

In general I am no advocate for extreme pinching and stopping, but in a season like this we must alter our tactics considerably both indoors and out; and although I still protest against the common practice of taking half the best foliage off a plant at one time, even if that plant is only a Currant bush, I would under present circumstances advise the early removal of the most immature growth from all woody plants and the prevention of extension from this time, while for very choice specimens it might be even advisable to remove many of the later-formed buds from the axils with the point of a knife. Endeavour to keep the earliest-formed growth clean, and give it all the light possible as far as next year's welfare is concerned; but Vines which are bearing fruit must be treated very carefully for the sake of the present crop. To remove foliage is to check circulation, to prevent swelling and colouring, to cause shanking, and spoil flavour; hence the necessity of preventing a superabundance of growth by timely stopping and disbudding.

In a previous paper I have insisted on the necessity of keeping up the temperature of late vineries by artificial means so long as the natural means fail, and as it is so important I again draw attention to it. In ordinary seasons our vineries without fire heat and with abundance of air rise to 90° or 100°, as indicated by a shaded thermometer day after day; and although they may go down in the morning at sunrise to 60° or lower, it is only for a very short time, and if the average for the twenty-four hours were made out it would probably often reach to between 75° and 80°. I do not advise attempting to reach such an average by fire heat unless we could have a corresponding amount of light; but I do advise that something be done towards it, so as to secure the ripening of the earliest formed wood, or we may have to mourn the loss of crops indoors next year as well as out. Since the flowers were set I have aimed at a minimum temperature of 65°, giving a rise of 5° as soon as possible in the morning. A little air has been given during the day in dull weather, and when the sun chanced to appear we were afraid to make as much use of it as usual, as the growth being mostly made without sunlight there was a danger of scorching; but we took advantage of

such occasions to give plenty of air and thus get the growth a little hardened. My minimum from the time of starting till the flowers were set was 55° as usual. At the first sign of colouring air will be given abundantly; for if this process is hurried it can never be perfect. I hope to see hard brown wood, bright green leaves of great thickness, and perfectly coloured fruit at the same time, then all will promise well for another year.

I am afraid there is a great deal too much damping and syringing done during the present season. Mr. Luckhurst told us of an amateur who took his ventilators away and locked them up during his absence. There is no doubt in my mind that if the same thing had been done with water-pots and syringes this season, in many cases there would have been better fruit and healthier foliage with less mildew and aërial roots. I have nothing to say against damping the floor of a house at closing time, if it is dry; but I can say much against damping it when it is not dry, and also against having leaves and fruit dripping wet half their time.

For the present I can only hint that as fruit which is damped over a good deal is not usually well flavoured, I have no doubt the deficiency is caused by the prevention of natural exhalation. I suppose it will be allowed that there are exhalations from fruits; and if these are checked there must be a check in the circulating system, and the fruit cannot appropriate the matter necessary for its perfect maturation.—WM. TAYLOR.

BANKSIAN ROSES.

SEVEN years ago I planted some white and yellow Banksian Roses against the north side of a lofty building in Sussex. They have grown so freely that they are now upwards of 40 feet high, yet till the present year branches and leaves have been my only reward; now, however, they have a few clusters of flowers, proving the truth of what has been told despondent correspondents, that these old favourites do not asually flower in a young state when growing upon a north aspect. I was induced to plant these Roses from having seen some very old trees of the same kind blooming freely in a similar position, and gladly turned the fact to account in order to add what will some day prove a charming feature to a side of the house that is usually somewhat dull-looking and consequently unattractive.—EDWARD LUCKHURST.

YOUNG VERSUS OLD STRAWBERRY PLANTS.

It has often been stated that young Strawberry plants not more than three or four years old are the best and heaviest fruiters, and that the plants should never be kept after that age. This may be the rule in some places, but there are exceptions. Here our Strawberry plants will hardly produce fruit until they are two and three years old, and after that they bear most abundantly. We have to-day (July 2nd) gathered forty-eight quarts of capital fruit from plants which cannot be less than ten or twelve years old; but those planted last year and the season before are only bearing very sparingly. The old plants never make much leaf-growth, but produce an enormous quantity of flower, which yields much finer fruit than many persons would expect were they to judge by the age of the plants.

Old plantations are very liable to become infested with weeds, but of course this can always be prevented. Our Strawberries are mostly growing in a stiff half-clayey soil. A little short dung is forked in about their roots every autumn, and in spring the surface of the ground is thinly covered with half-decayed stable manure, which no doubt affords the plants nourishment and at the same time keeps the fruit from coming in contact with the soil.—J. Muir, Margam.

THE PROPOSED NATIONAL CHRYSANTHEMUM SHOW.

I AM glad to see from Mr. Elliott's notes on page 28 that all growers of this lovely flower have not lost sight of the proposed coming contest. The time for stopping the shoots is over; and very shortly the crown and terminal bud will have to be considered, as success depends greatly upon this point and choosing the right bud for producing the best flowers according to the variety. From now will be an anxious time for the grower, for he must watch lest his flowers are overgrown, ragged, and coarse on the one hand, or undersized and puny on the other.

Respecting the proposed contest, it is desirable that it be known if anything is coming to a practical issue. The matter cannot be brought forward at a more appropriate time than the present, when all cultivators of the Chrysanthemum will watch from day to day the various stages of development of their plants.

The Birmingham Society have issued their schedule, and probably many growers were somewhat startled to find the solitary subscription from the Liverpool growers alone announced. Northern growers have certainly given proof of their earnestness by the practical step they have taken in remitting their portion of the contest prize, and thus appear ready to stage their blooms against those of other growers in a national display. Why do not Mr. Ollerhead and his friends send their portion of the subscription? Perhaps they do not intend to come to Birmingham; if so, we can only conclude they lack earnestness in the matter.

I should be glad to know if the £20 cup that the liberal Kingston Society were getting up will be open to northern growers at a moderate entrance fee, or if the guinea for entrance is still required; if so it will look like shutting out distant exhibitors, so that the cup can remain within a certain radius of London. Growers from the west should also come forward and take part in the coming contest. Bristol growers have only to send their portion of the contest money to entitle them to enter the lists at Birmingham. Growers on contributing to the prize fund from all localities can compete.

Horticulturists were left to judge of the conduct of the Liverpool growers when the challenge was first thrown out; it may now be fairly asked, Who has taken the most practical step towards promoting a friendly meeting of northern and southern Chrysanthemum cultivators?—A MIDLAND GROWER.

NATIONAL ROSE SOCIETY'S PROVINCIAL SHOW, MANCHESTER.—JULY 19TH.

NOTWITHSTANDING the postponement of the Show from the 12th to the 19th inst. the date, late as it was, was still too early for those for whom the Show was primarily instituted; for northern growers were as a rule quite unable to stage blooms in superior condition, and the prizes consequently went, with one or two exceptions, to those who may be termed southern growers. The morning of the Exhibition opened with a grey drizzling rain, and before noon it came down in torrents, very similar to thunderstorms. Fortunately the Show was held in a glass building, much more suitable under the circumstances than a tent, and the long lines of Roses were pleasingly relieved by hanging creepers and the numerous decorative plants tastefully arranged between many of the boxes by the Curator of the Royal Botanic Gardens, Mr. Bruce Kindlay.

Bruce Findlay.

Devonshire, Herefordshire, Lancashire, Somersetshire, Wiltshire, Essex, Nottinghamshire, Lincolnshire, Cambridgeshire, Cheshire, Hertfordshire, and Oxfordshire all contributed to this excellent display. Dark Roses preponderated; but dark Roses are favourites, and this year the want of sunshine has brought them out in their richest colours, while light Hybrid Perpetuals are, in the majority of cases, found wanting in finish and symmetry. Le Havre, Duke of Edinburgh, and Alfred K. Williams were exhibited in almost every collection in the highest excellence. The high average quality of the blooms and the numbers staged made up the best Rose show of the season (unless it was Hereford, which also claims that honour), but the excessive rains, we fear, must have told seriously on the finances; yet, notwithstanding the continual downpour, from one to four o'clock there was a very fair attendance, and the Show appeared to be more keenly appreciated by the visitors than are similar shows in the south.

The schedule consisted of sixteen classes, five for nurserymen

The schedule consisted of sixteen classes, five for nurserymen and six for amateurs, the remainder being open classes. In addition to these the prize of £5 offered by G. P. Hawtrey, Esq., at the recent Crystal Palace Show and not competed for on that occasion, was transferred to the Manchester portion of the schedule. The conditions of this prize are "three trusses of any new seedling Bose not yet in commerce. A ground plant of the variety to be also shown." The prize was won by Messrs. G. Paul & Son with their Hybrid Perpetual Duke of Teck—a very vivid scarlet. The plant removed from the open ground was strong and robust and

of good habit.

NURSERYMEN'S CLASSES. — For seventy-two distinct, single trusses, four collections were staged, the awards going in the following order. First, Mr. B. R. Cant, Colchester; second, Messrs. Cranston & Co., Hereford; third, Messrs. Paul & Son, The Old Nurseries, Cheshunt; and fourth, Messrs. Keynes & Co., Salisbury. All these stands contained some really magnificent blooms, many of them surpassing in both size and quality any which have been exhibited at the metropolitan exhibitions this year, and it must have been a most arduous task for the Judges to decide on the

relative merits of the collections. By many observers it was thought that Messrs. Paul & Son should have had a higher position. Mr. Cant's first-prize collection consisted of the following—Etienne Levet, Madame Hippolyte Jamain, John Hopper, François Michelon, Beauty of Waltham, Louise Peyronny, Duke of Edinburgh, La France, Madame Charles Wood, Marguerite de St. Amand, Marie Baumann (the largest bloom of its kind in the Show), Marquise de Castellane (very fine indeed), Princess Beatrice, Louis Van Houtte, Thomas Mills (exquisite), Maurice Bernardin, Marquise de Mortemart, Comtesse d'Oxford, Dupuy-Jamain, Madame Nachury, Général Jacqueminot, Capitaine Christy, Prince Camille de Rohan, Abel Grand, Antoine Ducher, Hippolyte relative merits of the collections. By many observers it was Prince Camille de Rohan, Abel Grand, Antoine Ducher, Hippolyte Jamain, François Louvat, Gloire de Vitry, Le Havre (a most beau-tiful bright flower), Devoniensis, Mrs. Rivers, Xavier Olibo, Pitord, Madame Cambacères, Baronne de Rothschild, Madame C. Joig-neaux, Mons. Noman, Charles Lefebvre, Madame Marie Cointet, Madame Prosper Langier, Madame Lacharme, Mrs. Baker, Alfred Colomb, Ferdinand de Lesseps, Souvenir d'un Ami, Madame Colomb, Ferdinand de Lesseps, Souvenir d'un Ami, Madame Ferdinand Jamin, Souvenir d'Elise, Catherine Mermet, Horace Vernet, Duchesse de Vallombrosa, Madame Victor Verdier, Maréchal Niel, Exposition de Brie, Niphetos, Star of Waltham, Fisher Holmes, Mons. E. Y. Teas, Nardy Frères, Abel Carrière, Ville de Lyon, Dr. Andry, Madame Caillot, Marie Rady, Duc de Wellington, and Madame Sophie Fropot. Messrs. Cranston & Co.'s collection was very fresh, but the blooms were somewhat smaller than those staged by Messrs. Paul & Son, who exhibited grand examples of Charles Lefebvre, Duke of Edinburgh, Marie Baumann, Général Jacqueminot, Marie Finger, Le Havre, Horace Vernet, and A. K. Williams. Messrs. Keynes' blooms had apparently suffered very much from heavy rains. much from heavy rains.

For forty-eight triplets Messrs. Paul & Son were deservedly awarded the premier prize with grand and massive blooms of François Michelon, Duke of Edinburgh, splendid; Marguerite Brassac, very fine; Duchesse de Vallombrosa, Sultan of Zanzibar, Centifolia Rosea, Niphetos, Madame Charles Wood, Madame Hippolyte Jamain, Nardy Frères, Narcisse, Horace Vernet, Charles Darwin, Madame Nachury, Princess Beatrice, Beauty of Waltham, Marie Rady, La France, Mrs. G. Paul, Marie Finger, Abel Carrière, Souvenir de Malmaison, Marie Baumann, grand; Etienne Levet, good; Monsieur Gabriel Tournier, Alfred K. Williams, Madame Lacharme, the finest bloom of this variety in the Show; Monsieur E. Y. Teas, Madame Prosper Langier, Monsieur Noman, Madame Victor Verdier, Marguerite de St. Amand, Charles Lefebvre, Star of Waltham, Général Jacqueminot, Comtesse de Serenye, a seed-For forty-eight triplets Messrs. Paul & Son were deservedly victor verdier, marguerite de St. Amand, Charles Leteovre, Star of Waltham, Général Jacqueminot, Comtesse de Serenye, a seed-ling, Henri Ledechaux, La Duchesse de Morny, Mrs. Laxton, Baronne de Rothschild, Camille Bernardin, Magna Charta, very good; Dr. Andry, Abel Grand, and Cheshunt Hybrid. Mr. Cant was placed second, staging amongst others excellent blooms of Fisher Holmes, Marie Finger, Alfred K. Williams, Marie Bau-mann, Devoniensis, Duke of Edinburgh, Marguerite de St. Amand, Souvenir d'Elise, Marie Rady, and Souvenir d'un Ami. Messrs. Keynes & Co. occupied the third position. Messrs. Cranston and

Co. also exhibited in this class.

In the class for twenty-four triplets Mr. B. R. Cant secured the foremost position with good blooms of Duke of Edinburgh, François Michelon, Baronne de Rothschild, Marie Rady, Marguerite de St. Atmand, Marie Baumann, Madame Nachury, Etienne Levet, Niphetos, Mdlle. Marie Cointet, Horace Vernet, Exposition de Brie, Souvenir d'Elise, Madame Prosper Langier, Exposition de Brie, Souvenir d'Elise, Madame Prosper Langier, Duchesse de Vallombrosa, very clean and perfect; Ferdinand de Lessepa, Fisher Holmes, Monsieur Noman, Duc de Wellington, La France, Marquise de Castellane, and Souvenir d'un Ami. Messrs. Paul & Son were a very close second with Sultan of Zanzibar, Marie Baumann, Duc de Rohan, Devoniensis, Mrs. G. Paul, Centifolia Rosea (Mr. Paul as a rule exhibits this flower in better condition than it is generally met with), Ferdinand de Lesseps, Beauty of Waltham, Marguerite de St. Amand, Charles Levelvre, Madame Nachury, Madame Lacharme, Nardy Frères, Horace Vernet. François Michelon, Souvenir de la Malmaison, Duke of Teck, Duchesse de Vallombross, Marie Baumann, La France, Dr. Ardyn Moscient Calvid Tournier and E. V. Toose Dr. Andry, Monsieur Gabriel Tournier, and E. Y. Teas. Mr. Prince, 14, Market Street, Oxford, well won the first position

Mr. Prince, 14, Market Street, Oxford, well won the first position in the class for twenty-four singles with Xavier Olibo, Baronne de Rothschild, Marie Baumann, La France, François Michelon, Duchesse de Vallombrosa, Horace Vernet, very good; Madame Sophie Fropot, Général Jacqueminot, Mons. Gabriel Tournier, Ferdinand de Lesseps, Madame Marie Verdier, Marquise de Mortemart, Maréchal Niel, Alfred Colomb, Marquise de Castellane, Mdlle. Marie Cointet, Hippolyte Jamain, Alba Rosea, Souvenir d'un Ami, Sombreuil and Auguste Rigotard. Messars. Dickson and Sons. Newtown Nurseries. Chester. were second: third honours Sons, Newtown Nurseries, Chester, were second; third honours falling to Mr. Cooling, Bath. Messrs. Dickson & Co.'s collection was very good, evenly set up, and very fresh, but smaller in size than the first-prize collection. There were four competitors in this class.

Mr. B. R. Cant secured the premier award for twelve Teas or Noisettes with a grand collection comprising Souvenir d'Elise, Madame Bravy or Alba Rosea, Souvenir d'un Ami, Devoniensis, Moiré, Maréchal Niel, Niphetos, Jean Ducher (the colour peculiar to this Rose at the back of each petal was more striking than we

have ever noticed it before, every petal being streaked with a deep reddish-brown), Madame Willermoz, Marie Van Houtte, Catherns Mermet, and Caroline Kuster. Mesers. Paul & Son occupied the second position with Narcisse, Cheshunt Hybrid, a fine bloom of Adrienne Christophle, Niphetos, Marie Van Houtte, Souvenir d'un Ami, Bouquet d'Or, exquisite; Anna Ollivier, Alba Rosea, and Madame Willermoz. Mr. Prince was third, having in his collection good blooms of Rachel, Sombreuil, and Alba Roses

AMATEURS' CLASSES.—The prize collections contributed by ama-teurs were as meritorious as those of the nurserymen. Mr. Baker teurs were as meritorious as those of the numerymen. Mr. Baker and Mr. Jowist boah exhibited in the larger classes in first-rate style, and between them there was a very close and keen congestion. In the class for thirty-six distinct Mr. Jowitt held the premier position with Alfred Colomb, Madame Hippolyte Jamain, Beauty of Waltham, Capitaine Christy, Duke of Edinburgh, Marquise de Castellane, Madame Lacharme, Mdlle. Eugénie Verdier, Sir Garnet Wolseley, La France, Dr. Andry, Marguerite de St. Amand, Prince Arthur, Marquise de Mortemart, Marguerite Brassac, Mdlle. Marie Cointet. Duc de Wellington. Marie Badv. Edouard Morres Marie Cointet, Duc de Wellington, Marie Rady, Edouard Morrea, Vicomte Vigier, Madame C. Crapelet, Prince Camille de Roban, Dupuy-Jamain, Comtesse de Chabrillant, François Micheloa, Horace Vernet, Camille Bernardin, Madame Bravy, Le Havre, very good; Madame Nachury, Comtesse de Serenye, and Marie Baumann. Mr. Baker was placed second with a good collection, but one or two of the blooms had lost their colour. The Ber. Canon Hole was third, having in his collection good blooms of Charles Lefebvre, Homere, Souvenir d'Elise, La France, Duke of Edinburgh, and Anna Ollivier. Mr. Mayo, Oxford, was awarded the fourth prize.

Six competitors entered the lists for twenty-four singles, and in this class Mr. Baker turned the tables on his friendly rival Mr. Jowitt, the latter occupying the second position. The collections Jowitt, the latter occupying the second position. The collections of both gentlemen were grand. Mr. Baker's comprised Canille Bernardin, Alfred Colomb, Lord Macaulay, Centifolia Rose, Avocat Duvivier, a very bright Rose of the Maréchal Vaillant type; Madame Hippolyte Jamain, Charles Lefebvre, François Michelon, Le Havre, Marquise de Mortemart, Jean Liabaud, Marie Baumann, Baronne de Rothschild, Etienne Levet, Madame Victor Verdier, Abel Carrière, Magna Charta, Mons. E. Y. Teas, Marie Rady, La France, Alfred K. Williams, Duke of Edinburgh, Marquise de Castellane, and Beauty of Waltham. Mr. Jowitt also staged grand blooms. Arthur G. Soames, Esq., Irnham Park, Boune, was a very close third, staging a box of fine Roses, but somewhat lacking variety in colour. The Rev. Canon Hole received the fourth prize.

fourth prize.

In the class for twelve blooms there were nine cellections. J. L. In the class for twelve blooms there were nine collections. J. L. Curtis, Esq., Chatteris, Cambs, was placed first with a stand omprising La France, Le Havre, Madame Victor Verdier, Madame Hippolyte Jamain, Duc de Rohan, Charles Lefebvre, Baronne de Rothschild, Auguste Rigotard, Olivier Delhomme, Duc de Wellington, Duchesse de Caylus, and Comtesse d'Oxford. Mr. Alfred Evans, Marston, Oxford, was awarded the second prize, having in his collection a very fine Maréchal Niel. The Rev. J. H. Pemberton, Romford, third.

Ten collections were staged for six blooms, and the majority of them were very good. Mr. E. Mawley, Croydon, obtained, as he well deserved, the first place with fine blooms of Baronne de Rothschild, Marie Baumann, Madame Victor Verdier, Madame Hippolyte Jamain, Paul Verdier, and Etienne Levet. Mr. J. L. Curtis and the Rev. E. D. Fellowes, Royston Rectory, were second and third

respectively.

In the class for six Roses grown within a district of twenty miles of Manchester there were several very poor collections, the best coming from W. F. Palfrey, Esq., Millington, near Altricham; Mr. James Brown, Heaton Mersey, obtained the second prize; and Mr. John Devonport, Bollington Mills, Altrincham, the third.

Six boxes of Teas, twelve single blooms, were staged in the amateurs' class, and the awards fell respectively to the Rev. Canon Hole, the Rev. E. D. Fellowes, and Mr. Jowitt in the order of the names, all exhibiting well considering the most unpro-

pitious season.

OPEN CLASSES.—Of new Roses in commerce previous to 1876 there were three collections staged, Messrs. Paul & Son being far ahead of other exhibitors with the following collection:—Constantine Fretiakoff, Marchioness of Exeter, Mons. G. Tourier, Magna Charta, Souvenir d'Anguste Riviere, Marquise de Murnais, Alfred K. Williams, fine; Edouard Pynaert, Mrs. Larton, Madame Gabriel Luizet, Charles Darwin, and Madame de Montales an chauveau. Mr. Cant was placed second, but the majority of the blooms were very small. Three collections were staged. The other was so inferior that the Judges withheld the prize.

There were only two competitors in the class for twelve blooms of Capitaine Christy, both of which fell considerably below the usual standard of this popular Rose, and the first prize was withheld, the second prize being awarded to Messrs. Cranston & Co. for a collection of small flowers scarcely sufficiently expanded, and the third prize to Messrs. Paul & Son for blooms of good substance but considerably expanded. stance but considerably overblown. For twelve single trusses of Alfred Colomb there were four collections staged, and the awards fall to Mr. Baker, Mestrs. Paul & Son, and Mr. Cant in the order of their names. Mr. Mayo was the only exhibitor of twelve blooms of Maréchal Niel, and these merited a second award.

MISCELLANEOUS.—Mr. Samuel Barlow, Stakehill House, Middleton, staged a most beautiful and charming collection of about 150 blooms of Persian Ranunculuses, comprising from forty to fifty varieties, most of which were of the most perfect symmetry, the various colours ranging from deep black to pure white, scarlet, yellow, and carmine; others were tipped like Picotees, whole collection commanded great admiration. Some and use whose collection commanded great admiration. Some of the varieties in this magnificent collection were purchased by Mr. Barlow from the collection of Mr. Carey Tyso. Messrs. Dickson & Robins, 12, Old Millgate, exhibited an extensive collection of herbaceous plants; Messrs. Dickson, Brown, & Tait collections of cut Roces and Psoonies; and Mr. T. Stadd, Cross Street, Manchester, a variety of bouquets, baskets of flowers, also wreaths, the whole of which were much admired.

LIQUID MANURE TO FORCED STRAWBERRIES.

IN answer to "A FOREMAN'S" inquiries as to the merits of applying liquid manure water to forced Strawberries, I will gladly give him my experience. I never give my Strawberries Liquid manure till I see the fruit is swelling. My opinion is, the less liquid manure the better up till that period, as it causes the soil in the pots to go sour; neither do I use saucers to hold water, for I think the sooner the water passes through the soil the better it is for the plant. It is not the liquid manure that throws up the flower spike, but the compost in which the plants are potted. I always pot mine in good loam three parts, and one part old cowdung.—THOMAS PITTS.

"A FOREMAN," on page 22, asks for the views of cultivators on watering Strawberries for forcing with liquid manure. After long practice and many experiments I have proved to my own satisfaction that liquid manure is not necessary until after the fruit is set, provided the plants have been properly potted in suitable soil. Every year my practice is to stack up some rather strong turfy loam with alternate layers of fresh house droppings. This with the turf often causes slight fermentation, and the result is a valuable compost heap. This is chopped down as wanted, and mixed with lighter soil if needed by certain plants; but for Strawberries the only addition is half a peck of bone dust to each barrowful of soil. This is used in a moderately moist state—neither wet nor dry, and the plants are potted very firmly. Strawberries thus grown are not benefited by liquid manure until the heavy crop of fruit commences swelling; it is then given until the first fruits show colour, and no longer. The bone dust is a valuable addition to the soil, and for quickly swelling the fruit nitrate of soda, about a quarter of an ounce to a gallon of water, is excellent. No stimulant acts more promptly than this, hence its value in Strawberry forcing where much is sought to be effected in a little time.-AN OLD GROWER.

A RUN TO THE WEST-OKEFORD FITZPAINE.

OR rather should I not say in this terrible season a voyage to the west? for there was wind enough to fill the sails of any ship and water enough to drown one; but I had promised to go to Torquay, and the pleasure of going there was enhanced in anticipation by the opportunity it afforded me of paying another visit to my dear old friend Mr. Radclyffe at Okeford Fitzpaine. This is always a day of great pleasure to me, although I now see that time and suffering are evidently marking their hands on my good friend, but whose heart is as warm as ever, and, although long past the threescore years and ten, is as ardent in his love for the Rose and as keen in all that pertains to good gardening as ever he was.

As I have more than once said, Mr. Radclyffe not only has no advantages in his position, but labours under many serious disadvantages. His garden is open to nearly every wind that blows, as he himself says. It is open to the south until you get to Portland, to the east until you get to London, and to the south-west until you get to Gibraltar, while the soil is light and poor, and yet withal that he manages to grow Roses in a style which would not discredit those who enjoy the favourable

conditions of a good soil and fine situation.

I have so often written about his Roses that I will not repeat my oft-told tale, especially as, owing to the season, they were not so advanced as to enable me to see them in their full beauty. One thing I was particularly struck with: In front of his house he has a row of Madame Clemence Joigneaux as

standards. They are budded on the Manetti; the shoot is then trained up as a single stem. When it is about 4 feethigh the top is pinched out, and it is then allowed to form a head as in an ordinary budded standard. Nothing could have been more vigorous than these Roses or cleaner than their bright polished green stems. There are not many of the new Roses to be found here. I was, however, most interested in the Peach and Nectarine trees, especially as my old neighbour Mr. Luckhurst has written about the extensive blistering of the leaves, from which my trees have suffered much. The trees at Okeford Fitzpaine are very numerous, especially when the space of wall on which they grow is taken into account. There are 120 Peach and Nectarine trees; they are neither cordon nor fan-shaped, but are made to accommodate themselves to their situation, and are all treated on the short-spur system. On a small tree of Prince of Wales I counted twenty-two fruits, on one of Royal Ascot twelve; while Early York, Magdala, Dr. Hogg, Noblesse, the Nectarine Peach, Rivers' Royal, Golden Frogmore (a gift from Mr. Turner), Royal George, and other kinds had all more or less fruit on them, while the foliage was clean and healthy; and this not owing, as will be seen, to any favouring conditions of soil or climate, but to constant care and supervision and high cultivation. I am not sufficiently myself up in the subject to decide on the point, but certainly in all aspects and with all varieties there was less blister to be seen than I could show on one tree. My friend once used to go in strongly for Strawberries, but he has slackened in his culture and has now confined himself to Rivers' Eliza. Recurring again to Roses, Mr. Radclysse, like a good many others, has formed a very decided opinion on the merits of the seedling Briar in preference to the Manetti, of which he has been so strong an advocate.

While all bush fruit are abundant the larger kinds are an almost complete failure. There are no Apples nor Plums and but very few Pears. One tree of Duchesse d'Angoulême in Mr. Radclyffe's garden, about 20 feet high, a gift in bygone days from Mr. C. Turner, was one sheet of bloom, and yet there was not a Pear on it; and the orchards all around bore witness to the fact that the promise of an abundant crop had been utterly destroyed by the cold and cheerless spring. By-the-by I was just in time to see the garden, for on the following morning a terrific gale blew through it and knocked the Roses to "smithas he wrote me. It was with feelings of thankfulness at having once again been permitted to see my valued friend that I left him to cast myself on the stormy sea of the Somerset and Dorset line, for improved although it be yet I found to my cost that it was not to be trusted, though it is said to run in connection with the South-Western .- D., Deal.

WEST KENT HORTICULTURAL SOCIETY.

JULY 19TH.

THIS prosperous Society held its annual Exhibition last Saturday in the grounds of the Misses Ellis at Widmore, Bickley, an extremely pleasant site for an excellent and successful Show. must be very gratifying to the Committee of the Society, and equally so to all interested in its welfare, to record a balance of £125 to the credit of the Society, and the fact speaks well both for the management and the supporters.

A great number of classes were provided, the most important of which were fairly represented, although, of course, there were a few unavoidable blanks. Cut Roses were in many instances excellently shown, and the exhibitors were numerous, but the most remarkable feature was the large number of miscellaneous groups from nurserymen and amateurs, and the success of the Exhibition was in no small degree due to these gentlemen.

There were only two competitors in the open class for twelve stove or greenhouse plants, and although there were in each collection a few good specimens, yet the majority were very indifferent. Mr. J. Mumford, gardener to J. Scott, jun., Elmstead, was placed first, and was followed by Messrs. Peed & Son, Nor-Vineyard Nurseries, Lower Streatham; and we cannot avoid observing that this was an instance of erroneous judging, which was somewhat unaccountable, for the latter collection w doubtedly the best, including an unusually fine Ixora salicifolia, a good I. coccines superba, a vigorous Allamanda grandiflora, and good I occines superios, a vigorous Anamanda grandinors, and a fair Rondeletia speciosa, while there was not one plant so bad as Mr. Mumford's Dracophyllum gracile and Imantophyllum miniatum, which were sufficient to damage any collection. It was a mistake to offer prizes for so many as twelve flowering plants thus late in the season, six would have been a more suitable number. In the amateurs' class for six Mr. J. Archer, gardener to F. Heritage, Esq., Orpington, staged the only collection and secured the first prize. The plants were of medium quality.

In the open class for nine foliage plants Mr. J. Archer, the only

exhibitor, obtained the first prize for a collection of even and well-grown specimens that was highly creditable. The most noticeable were Croton pictus, C. variegatus, Maranta rosec-picta, Dieffenbachia Bausei, and Cissus discolor, the foliage healthy and finely coloured. There were two competitors in the corresponding amateurs' class for six plants, and the premier position was secured by Mr. A. Flowers, gardener to J. Phillips, Esq., Elmstead, for vigorous specimens, among which Sanchezia nobilis variegats, Pandanus Veitchii, and Maranta splendida were extremely good. Mr. W. Gammon, gardener to C. Boosey, Esq., Bickley, followed with healthy plants, the beautiful Ficus Parcelli being in excellent condition.

Pelargoniums were not very numerous, the Show and Fancy warieties being poorly represented; but in the open class for six Zonals Mr. Henry Coppin, The Rose Nursery, Shirley, Croydon, staged some large and good plants, and easily obtained the premier award. Mr. H. Cole, gardener to A. Mitchell, Esq., Elmstead, and Mr. Oliver Real, gardener to J. Wither, Esq., Bickley, were placed in the order named, their plants being small but bright. Mr. H. Coppin was the only exhibitor of six tricolor varieties, the chief prize being most deservedly awarded him for extremely even and well-coloured specimens of Proteus, William Sandy, Miss Farren, and Sophia Dumaresque, &c. Two collections of six Gloxinias were exhibited, Mr. George Bridger, gardener to J. B. Alston, Esq., Bickley, being first with good plants, the flowers of which were large and finely coloured. Mr. F. Maynard, gardener to J. Whitehead, Esq., Bickley, was second with rather small and indifferently flowered plants.

Caladiums were well shown by Mr. Archer in the amateurs'

Caladiums were well shown by Mr. Archer in the amateurs' class for six plants in 12-inch pots. The foliage was well coloured and the plants vigorous, so far surpassing those exhibited by the five other competitors that the first prize was secured. Mr. W. Gammon was second, and his plants were also good, but the varieties were inferior and the colour dull. Mr. J. Bridger was third with rather irregular specimens. Ornamental-foliage Begonizs was another class for plants that were numerous and in good condition generally. The prizes were obtained by Mr. H. Sawyer, gardener to W. Sentance, Esq., Bickley, Mr. W. Gammon, and Mr. A. Flowers in the order named. Hardy Ferns were noticeable for their freshness and vigour, particularly in the first-prize lot of six from Mr. Gammon, which included Lastreas, Athyriums, and Osmunda regalis of medium size but good. There were a few Dracemas and exotic Ferns that do not call for special notice.

Roses.—The exhibits were more numerous than we had expected to see, and the quality of the blooms was generally good, particularly those from Messrs. Paul & Son of Cheshunt, who carried off the honours in the three open classes for forty-eight triplets, twenty-four singles and twelve blooms of one variety respectively. Among their forty-eight blooms there were some very fine and fresh; for instance, Beauty of Waltham, Marquise de Castellane, Madame Victor Verdier, Abel Grand, Camille Bernardin, Mrs. George Paul, Charles Lefebvre, Duke of Edinburgh, Cheshunt Hybrid, Etienne Levet, Souvenir de la Malmaison, Marie Baumann, La France, Mons. E. Y. Teas, Baronne de Rothschild, Avocat Duvivier, Alfred Colomb, Mons. Noman, Madame Lacharme, and Madame Hippolyte Jamain. Messrs. J. Laing & Co. were second with fair blooms, one of Beauty of Waltham being extremely fine. Messrs. T. Bunyard & Sons, the Nurseries, Maidstone, followed with small but fresh blooms of good varieties. In this class there were six competitors. Messrs. Pauls' twenty-four were even and fine, the varieties the same as those included in the forty-eight. Mr. J. W. Todman, Eltham, followed in this class with a good collection; and E. Mawley, Esq., Lucknow House, Addiscombe, Croydon, was placed third with bright and fresh blooms but small. Other exhibitors in this class were Messrs. Laing, Coppin, Piper, and Bunyard. The premier collection from Messrs. Paul of twelve blooms of one variety was extremely good, the Marie Baumann being in superb condition in colour, form, and substance. Messrs. J. Laing & Co. were the second with the same variety well represented. Messrs. J. Bunyard & Sons were third with François Michelon somewhat full.

In the amateurs' classes Captain Christy, Buckhurst Lodge, Westerham, staged a good first collection of twenty-four, in which the best were Dr. Andry, Dupuy-Jamain, Maurice Bernardin, La France, and Abel Grand. Mr. A. Gibson, gardener to F. Burnaby-Atkins, Esq., Sevenoaks, followed with blooms of very medium quality, except Dupuy-Jamain and John Hopper, which were in good form. The collections of twelve distinct, single blooms, were rather poor. Mr. H. Cole was first, followed by the Rev. J. M. Fuller, The Vicarage, Bexley, and Mr. T. Gearing. The blooms in the classes for six distinct and of one variety do not merit special notice.

special notice.

Cut flowers and table decorations were fairly well shown, particularly the latter, several of which were very tasteful, although it was generally admitted that a mistake was made in awarding the first prize for a table decoration 10 feet by 5, as the second-prize arrangement was more simple, less crowded, and yet very artistic in design. Mr. Cannell, Swanley, Kent, exhibited cut blooms of Pelargoniums, Verbenas, Pinks, Pæonies, &c., in their customary excellence.

MISCELLANEOUS GROUPS. — These were, as we have already remarked, very numerous; and the Society very justly notified their thanks for the valuable assistance afforded by awarding extra prizes to all the exhibitors. Messrs. Veitch & Sons, Chelsea, sent a large and handsome group of choice plants, comprising Orchids and foliage plants, Sarracenias, &c., also eight boxes of cut Rosea, very fresh and good. Mr. B. S. Williams, Upper Holloway, had an extensive collection of Crotons, Palms, Itoras, Orchids, &c., very tastefully and lightly arranged. Mr. John Wills, Onslow Crescent, sent a number of handsome foliage plants in which many of Mr. Bause's fine productions were very prominent. The group was, as usual, highly artistic in arrangement, Messrs. John Laing & Co., Forest Hill, exhibited a fine group of foliage plants and Tuberous Begonias. Outside the tents was a large circular group of annuals from Messrs. Carter & Co. of High Holborn and Forest Hill, which attracted considerable attention from the visitors. Mr. J. W. Todmorden, nurseryman, Etham, sent a group of Coniferous plants. Mr. James Wingfield, florist, Widmore Hill, Bromley, a miscellaneous collection. Messrs. Ped and Son, Lower Streatham, had a group of small Bricas; and Mr. J. Neighbour, gardener to George Wythes, Esq., Bickley, sent a very fine group of Achimenes.

Fruit was not abundant, nor was the quality all that could be desired, particularly in the Grapes, Melons, and Peaches. Stravberries were in greater numbers and generally well ripened in

a very nine group of Achimenes.

Fruit was not abundant, nor was the quality all that could be desired, particularly in the Grapes, Melons, and Peaches. Strawberries were in greater numbers and generally well ripened. In the class for thirty fruits of one variety Mr. E. Harris, gardener to G. W. Norman, Esq., Bromley Common, was first with a dish of excellent fruits of Sir Joseph Paxton; Mr. J. Fraser, gardener to Mrs. E. L. Betts, Bickley, was second with the same variety; and Mr. G. Tucker, gardener to J. L. Lovibond, Esq., Farnborough, followed with President, both rather small. For three dishes of distinct varieties Mr. W. Gammon exhibited excellent fruit, and was awarded the first prize; but it was pointed out to the Judges that only two varieties were shown—viz., Sir Joseph Paxton and President, and consequently the collection was disqualified. Mr. E. Harris was placed first with small but ripe fruits of Sir Joseph Paxton, Comte de Paris, and Keens' Seedling. Mr. C. Seymour, gardener to C. Duncanson, Esq., Bickley, was second with inferior fruit. Vegetables were not numerous but good; the principal prizetakers were Messrs. Gammon, Archer, Maynard, and Ke. The cottagers' productions were somewhat inferior to previous years.

The exhibits were arranged in four large marquees, and a word of praise is due to the Honorary Secretary, T. A. Mitchell, Eq., for the excellent system adopted. During the afternoon a large and aristocratic company assembled, and much satisfaction was displayed at the success of the Exhibition.

SLUGS.—These have been simply innumerable, and have had it pretty much their own way, devouring everything green. I tried dredging soot and lime, but all to no purpose; no sooner did I have these remedies applied than a downpour of rain washed them away and brought out the enemy in all his force again. Sawdust I think is the best, as it does not wash away so easily. Those who trusted in the belief of the severe winter killing slugs will have had their faith pretty much shaken before now I fancy; and as to the birds they, as has been stated by a correspondent, pay more attention to the Strawberries and Cherries than to the slugs and worms. By the way, are not all slugs carnivorous?—F. BOYES.

FRUIT PROSPECTS.

LINCOLNSHIRE.—Fruit prospects as far as I can see or hear are truly disheartening. On many Pear and Apple trees, notwithstanding the richest promise, nothing is to be seen but leaves. With us amongst other dessert Pears Marie Louise blossomed profusely and set abundantly. Soon, however, almost all the clusters perished, and the few that escaped when about the size of a hazel nut became spotted, turned black, and fell off. Apples, though not utterly hopeless, seem in a doubtful state. When about as big as walnuts they became badly grubbed, and for the most part look unhealthy besides, especially Cellini and King of the Pippins. All the Lord Suffield trees with us are fruitless. On one Apple tree I observed some dark caterpillars; they lay thick within the leaves as in a cradle, all their heads in one direction—towards the sun. They were in a young stage; when disturbed they raised their heads simultaneously.—A. M. B., Mid-Lincoln.

NORTHAMPTONSHIRE.—Although there was a fine show of bloom on nearly all fruit trees, the prospect of a good yield of fruit is not at all promising. Apple blossom was late, but few trees have any fruit. Beauty of Kent, Cox's Orange Pippin, Golden Pippin, Hawthornden, Holland Pippin, and a kind

called here American Peach—a large red Apple, in use from August to November, either for table or kitchen—are about the only kinds that have a full crop. Pears were very prolific with bloom, and many of the trees on walls have a good show of fruit, amongst them being Jargonelle, Williams' Bon Chrêtien, Beurre Diel, Marie Louise, Beurre Rance, Easter Beurre, and Autumn Bergamot. That useful culinary Pear Catillac has also a good crop. Apricots about half a crop; the trees on a south aspect have suffered severely, nearly half the wood being killed, but on west aspects not a branch is injured. Peach and Nectarine trees have suffered from the effects of the cold winter and spring. Some trees are killed; blister and curl have made those that are left have a very unsightly appearance. Plum blossom was good, but very little fruit has followed. Damsons are not plentiful. Gooseberries a full crop; but Currants, both Black and Red, are only half a crop. cherries had a fine show of bloom, but black aphides have so affected the trees, especially Morellos, that only a poor show of fruit will be the result. Mulberries have a good crop of fruit. Filberts and Cob Nuts are good, but of Walnuts there are but few. Stawberries showed plenty of bloom, but the continued rains and want of sunshine have damaged the fruit, particularly on old plantations. Young plantations are showing better, but unless we have more favourable weather, and that soon, the Strawberry crop will be a partial failure.—H., Peter-

DUMPRIESSHIRE.—We had a fine display of blossom, but have been greatly disappointed with many of the trees, which now have but a thin sprinkling of fruit. Cherries, with the exception of Morellos, are a poor crop. Plums: the only sort that has a full crop is Victoria. Pears and Apples (on walls) have done best here with a south-west aspect. The walls) have done best here with a south-west aspect. The varieties of Pears that have a good crop are Jargonelle, Beurré d'Amanlis, Beurré Diel, Chaumontel, Dunmore, Easter Bergamot, and Hessle. The following Apples have a good crop:—Lord Suffield, Cellini, Hawthornden, Old Nonpareil, Manx Codlin, Keswick Codlin, King of Pippins, Golden Pippin, Golden Harvey, Royal Pearmain, and Court Pendu Plat. Gooseberries and Currants are a fine crop, also Raspberries and Strawberries; all that we want now is sun to bring them to maturity. We are never very early here, but this year the crops are fully a month behind any season that I this year the crops are fully a month behind any season that I can remember. For days and weeks it has been raining more or less, and the weather has been cold and boisterous. Fruit under glass looks well both as to quantity and quality.—

JAMES DICKSON, Arkleton.

I AM sorry that "A SURREY PHYSICIAN," "WILTSHIRE RECTOR," and "AMATEUR, Cirencester," gave so bad an account of fruit prospects. Exceptions prove the rule, and I never had so large a crop both of Apples, Pears, and Plums, and also of common fruits, such as Gooseberries, Currants, Strawberries, and Raspberries.

Marie Louise is about my only exception to a good crop in Pears, though some few other sorts, such as Williams' Bon Chrètien, Beurré Superfin, and Beurré Clairgeau as bushes and pyramids are not doing well. Amongst Apples Lord Suffield, Emperor Alexander, Beauty of Kent, Improved Cockpit, Keswick Codlin, Rawlings (local name), Alfriston, Warner's King, and Sturmer Pippin are all in wonderful bearing. younger espaliers only three years planted, trained to wires, are bearing well. Amongst Plums Victoria is something wonderful; one tree, only a pruned pyramid, will return me at least a hundredweight of Plums. So, too, on a west wall two trees only three years old are covered from top to bottom. Apricots are a large crop, which I owe to proper wall protection. So, too, I venture to think, my system of pruning is the cause of my success; for though the winter was severe enough to kill the tops of a few unpruned trees in my kitchen garden, even though in front of a row of glass houses, yet owing to constant severe pruning my trees, only planted 6 feet apart each way in some quarters and 6 feet apart in the rows, going down the sides of a small fruit and vegetable garden, have nearly all of them a large proportion of fruit. Close pruning, close planting, protection from north-east winds and also from westerly gales, are the points I aim at, and let some strongergrowing varieties have free scope to grow at the corners. The only Plums not bearing are Transparent Gage and Early Green Gage. Jefferson also is not so large a crop as usual; but all the others are in good bearing.

I have about twenty-five varieties of Strawberries, and all

are in full bearing, the crop larger than any I ever saw. I have the advantage of a light dry soil over a sandy subsoil, and I can dig my garden any day after twenty-four hours without rain, or in ordinary weather at any time; and to this fact of soil, though with the ground sloping the wrong way—i.r., to the north instead of the south, I in a great measure attribute my success.—C. P. PEACH.

WEST OF ENGLAND ROSE SHOW. HEREFORD.-JULY 16TH.

"THE rain it raineth every day." Such has been the melancholy experience if not the actual remark of every long-suffering resarian in this most lachrymose of seasons. Indeed, as a matter of fact it was not until Wednesday, the 16th inst., following on that Black Monday which in many localities will be long remembered by the cruel damage done by winds and rain, that the first faint streak of hope in the shape of the silver lining which is proverbially said to underlie every cloud at last showed itself as the longdelayed welcome harbinger of positively two successive dry, warm, seasonable days!—a phenomenon so absolutely irresistible as to draw together to the ancient city of Hereford, on the occasion of her thirteenth thrice-postponed popular Floralia, decidedly the largest and best contested display of the queen of flowers which at that date had been held either in the metropolis or provinces. Such, at least, was the unanimous verdict of all the savants present save one, the hero of a hundred fights (though not this year at Here-ford), who declaring for Norwich had to follow himself with an aspect wiser—as was once said of Lord Thurlow—than any other man could possibly be, into the lobby of an Hibernian minority. So numerous, indeed, were the exhibits in almost every class—Mr. Charles Turner and Mr. A. Soames alone among celebrities not putting in an appearance—that all the faculties of the executive were taxed to their very utmost to find space for them within the statutory time allowed; but sufficient to state on this point, and thus avoid all suspicion of boredom or bombast, that no less than seven magnificent collections of seventy-two varieties were staged in the nurserymen's division, and all of them were excel-lent. It is somewhat curious to mention en passant that in spite of an exceptionally fine day and successful Exhibition, the attendance of the public was not quite up to the average—an unexpected result which the following suppositions may perhaps account for—viz.. that only a quasi kind of success was this year to be expected, or that the hard times we all hear so much about

and some feel acted as a deterrent element.

In the nurserymen's division, among major and minor constella-

tions, Messrs. Cant, Curtis & Sandford, Davison & Co., W. Griffiths, Keynes & Co., William Lee, and last but certainly not least George Replies & Co., Within Lee, and last the tertainty not least George Paul & Son, formed a galaxy of talent very rarely seen together. Mr. Cant, who seems to set this unpropitious season at defiance, carried off the first prize for seventy-two varieties (open to the United Kingdom), with remarkably smooth, large, finely coloured blooms of great merit of Comtesse d'Oxford, Louise Peyronny, Reynolds Hole, Mdlle, M. D'Ombrain, Mons. E. Y. Teas, Gloire de Vitry, A. K. Williams (brilliant scarlet), Capitaine Christy, Beauty of Waltham, Madame Nachury, Centifolia Rosea, Sir G. Wolseley, Madame Hippolyte Jamain, Antoine Ducher, Princess Mary of Cambridge, Ferdinand de Lesseps (very grand), Marquise de Castellane, Nardy Frères, Victor Verdier, Maréchal Niel, Star of Waltham, Antoine Mouton, Sénateur Vaisse, Marie Van Houtte (superb) Sultan of Zanzibar, Etienne Levet, Alfred Colomb, Souvenir d'Elise (superb), Camille Bernardin (very good), Mons. Etienne Dupuy, Le Havre, Anna Ollivier, Thomas Mills, Souvenir d'un Ami (grand), Vicomte de Vigier, Princess Beatrice, Duc de Wellington, Pitord, Alice Dureau, Xavier Olibo, Jean Ducher, Annie Wood, Madame Thérèse Levet (splendid), Marie Rady, Elie Morel, Avocat Duvvier, Abel Carrière (fine and useful), Marquise de Mortemart, Dupuy-Paul & Son, formed a galaxy of talent very rarely seen together. Abel Carrière (fine and useful), Marquise de Mortemart, Dupuy-Abel Carrière (fine and useful), Marquise de Mortemart. DupuyJamain. Madame Lacharme, Jean Soupert (grand dark bloom),
Catherine Mermet (superb), François Louvat, Rubens, Louis Van
Houtte, François Michelon, Madame C. Joigneaux, Fisher Holmes,
Duchesse de Vallombrosa, Charles Lefebyre, Anna de Diesbach,
Horace Vernet, Duke of Edinburgh, Général Jacqueminot, Mons.
Noman, Niphetos, Madame G. Schwartz, Sophie Coquerelle, Exposition de Brie, Baronne de Rothschild. Pierre Notting, and Dr.
Andry. Messrs. Cranston & Co. were second, and Messrs. Keynes
and Co. third.

Mr. Cant. also, performed, the Herculean, task this year of

Mr. Cant also performed the Herculean task this year of carrying off the first prize in seventy-two varieties, open to nurcarrying off the first prize in seventy-two varieties, open to nurserymen not residing in Herefordshire, with an equally grand collection, if anything more rich in Teas and dark-coloured Hybrid Perpetual varieties. Especially noticeable was an intensely dark high-centred Reynolds Hole of vivid brightness, great size, and substance, worthy in every way of its genial prototype, delicately fronted by an exquisite bloom of the time-defiant blushing Madame Bravy, and sentimentally flanked by incomparable specimens of Souvenirs d'Elise and d'un Ami, while the finishing touch of contrast was given to perfection by a glorious Duke of Edinburgh of fiery colour and perfect form. It was a marvellous bit of staging by a cunning old hand! May Birmingham next Thursday produce the like, and may your reporter be there to see it. Messrs. George Paul & Son were second, porter be there to see it. Messrs. George Paul & Son were second, and Messrs. Curtis, Sandford, & Co. third; Messrs. Keynes & Co. having an extra prize. Both these classes were admirably contested, though in some collections ill effects of weather were

apparent.

In thirty-six varieties (three trusses) Messrs. Keynes & Co. had thrown their chief strength, and deservedly took first prize with a splendid collection; second prize Messrs. Cranston & Co.; third prize Messrs. Curtis, Sandford, & Co. In twenty-four varieties Messrs. Cranston, who have barely begun even now to cut from maiden blooms, were placed first, Mr. Cant second, and Messrs. Keynes & Co. third.

Keynes & Co. third.

In the amateurs' class of thirty-six varieties Mr. R. N. G. Baker was first with a magnificent collection (I cannot describe better than in Mr. Laxton's words at Norwich) of large size, brilliant in colour, of great substance, and very even, to which may be added their retentive freshness. Abel Carrière, Prince Camille de Rohan (marvellous colour), Charles Lefebvre, John Stuart Mill, Madame Sophie Fropot (a good novelty), Etienne Levet, Baronne de Rothschild (grand), Thomas Mills, Cantifolia Roses, Dupuy-Jamain, Marquise de Castellane, Camille Bernardin (superb), Magna Charta, Mdlle. Rugénie Verdier. Comte de Rainband. Marie Rady. Annie Mdlle. Eugénie Verdier, Comte de Rainbaud, Marie Rady, Annie Wood, Louis Van Houtte, Madame de Montmartre, Alfred Colomb, Wood, Louis van Houtte, Madame de Montmarte, Alfred Colomb, La France, Marie Baumann, Marie Van Houtte, Duke of Edin-burgh, Mons. François Michelon, Marguerite Brassac, Le Havre, Lord Macaulay (very good), Beauty of Waltham, Auguste Rigo-tard, Duc de Wellington, Sir Garnet Wolseley, Mons. Noman, Duchesse de Vallombrosa, and Mrs. Baker. It is almost impossible to particularise where all in their kind were perfect. The National Rose Society's medal was won by the winner of the above prize. Mr. Jowitt was placed second with a collection almost faultless. This gentleman's blooms of Marie Baumann, La France, Etienne Levet, Dupuy-Jamain, Horace Vernet (superb), Mons. E. Y. Teas, and Duchesse de Vallombrosa were unequalled in the Exhibition. Rev. C. H. Bulmer secured the third prize. In eighteen varieties (three trusses) Mr. Baker, Mr. Jowitt, and Mr. J. H. Arkwright secured the prizes in the order named. In twenty-four varieties secured the prizes in the order named. In twenty-four varieties the same names appear in the prize list in the same order of merit. The Veitch memorial prize of £6 and medal was won by Mr. W. Aldridge, gardener to Mr. Jowitt.

The class of Tea and Noisette Roses was very good, and keenly and numerously contested. Mr. Cant was placed first, Messrs. Paul & Son second, and Mr. Jowitt third. Mr. J. H. Arkwright's

special prize (£5) for twelve Hybrid Perpetuals and twelve Teas and Noisettes was carried off by Mr. Jowitt with a superb artistically arranged collection, reflecting equal credit on the winner and originator of so novel and charming an ides.

In the two classes for new Roses sent out in 1878-79 Messrs. G. In the two classes for new Roses sent out in 1878-79 Messrs, G. Paul & Son were first, Mr. Cant second, and Messrs. Curtis and Sandford third. Fair blooms were exhibited of H.P. Madame de Montchauveau, soft glowing pink; H.P. Boildieu (a fine bloom of great substance, not as usual somewhat fiat); H.P., A. K. Williams (most promising searlet, shown well here and in collections); H.P. Charles Darwin, with grand foliage, thought much of by Mr. G. Paul, and said not to burn.

In the class restricted to Herefordshire Miss Bulmer took Col, Arbuthnot's special prize, £5, for twenty-four varieties, also the Arbuthnot's special prize, 20, for twenty-rour varieties, also the Society's first prize for twelve varieties (three trusses) and twelve varieties (singles) with remarkably fine and well coloured blooms, as usual with this lady admirably staged.

The Judges in the amateurs' division were Messrs. Cant and G. Paul; in the nurserymen's, Messrs. Baker and Arkwright; and in the decorative department Rev. W. B. S. Stanhope and H. Cooper

Key.

It only remains to add that the decorations for which valuable

The and other friends of the Society were keenly and gracefully contested, that the band of brass which so disturbed "WYLD SAVAGE'S" equilibrium last year was which so disturbed "WYLD SAVAGE'S" equilibrium last year was by a novel arrangement advantageously removed to some distance in the open air, and that the only contretemps in the way of a crumpled Rose leaf your reporter this year has to bewail is the obligation of having to fill the place of one who so genially in our Journal "paints the Lily and adorns the Rose."—The HEREFORDSHIRE INCUMBENT.

THE SUNLESS SEASON.

THE same thing had struck me which I see "WYLD SAVAGE" brings out in his interesting article on the Roses of 1879, and that is how well Roses seem to progress without sunshine. I apprehend there is hardly such a sunless season upon record, yet the Strawberries continue to ripen, the Raspberries to colour, and the Roses to open excellently. Duke of Edinburgh a fortnight ago, and now La France, have been in great perfection. Cheshunt Hybrid would be if it could have two dry days together. I have noticed also Fisher Holmes as especially glowing. I suppose never was Rose-opening spread over so wide a period. Last year my Roses were all over in a fortnight; this year they have been going on for six weeks, and still some, such as Paul Neyron and Madame de Serenye, have

hardly begun.

I have been interested in observing the earliest Roses. Duke of Edinburgh and John Hopper were well to the front, also Annie Laxton, a very early Rose. Cheshunt Hybrid is early in sheltered places; I have had perfect hedges of bloom of this also Camille de Rohan and Duke of Wellington. With regard to this latter I incline to think that Mr. George Paul ought to introduce it into his duplicate list, bracketed with Fisher Holmes. I find it very hard to tell them apart or together. It is to be feared, unless sunshine comes, the amount of unripened wood this autumn will be very considerable—a dreary prospect for next year, especially if the usual hard winter follows the unusually wet season. I am glad to see Mr. Mawley's notice vindicating his brother N.R.S. Secretary. All secretaries who have had to do with putting off Rose shows know the extreme inconvenience, and avoid this if possible; but Mr. D'Ombrain the first place consulted his Committee, and in the next, neither he nor they could possibly alter a long-before advertised Crystal Palace fixture.—A. C.

SUTTON'S CONQUEROR TOMATO.

ALLOW me to bring to the notice of your readers the merits of the above Tomato. Quite accidentally about the middle of April I was offered a dozen plants of Conqueror; it was new to me, but being struck with the appearance and style of its growth, some larger plants being planted out and doing well, I accepted them. I planted them out the first day of May in a small span house on the north side, the house running east to west, and wonderfully well they have done. This is the best of all the varieties I grow for setting its fruit freely. I have counted a dozen good fruit in a bunch, plenty with six, seven, and eight in a cluster, of a good size. The largest I have weighed of this turned the scale at 10 ozs. The medium-sized ones are, however, the handsomest, and and medium-sized ones are, nowever, the nanosomess, and handsome they are. It is of a very pleasing colour, and when placed in the boxes promiscuously amongst three or four varieties is readily distinguished. This is an excellent Tomato for indoor work, far superior to the old Red, which variety, nevertheless, still holds a good position here.

On the south border of the house I planted Melons; these reactions where the tops of the house meating the Tomatos.

are now up to the top of the house, meeting the Tomatoes. These Melons unfortunately have been much infested with black aphides, and where these creatures come from is a mystery, the Melons and the house also being perfectly clear at starting. It is years since I saw this insect so bad as it is now; many are complaining of it, and we all know how very difficult it is to keep this enemy down, more especially in frames. More than one lot of Melon and Cucumber plants have been destroyed in this neighbourhood, the frames being cleared out and filled with fresh plants.—STEPHEN CASTLE, Broadwater,

Worthing.

ROSE TOPICS.

I CAN fully confirm what "E. M., Croydon," says with regard to the National Rose Show, and it is a pity "WYLD SAYAGE" is not a little more cautious in his remarks. It is impossible to be always altering and postponing the dates of Rose shown especially that of the National Rose Show. No doubt it would have been wiser when the date was first considered to have fixed it later owing to the winter which we have had. Besides, when arrangements are made early in the season with a Company like that of the Crystal Palace an alteration in the fixture is not easily made. The next Saturday clashed with the Alexandra Palace Rose Show, and the Saturday after, the 12th, was the original fixture for Manchester. Luck. y I can quite agree in "WYLD SAVAGE'S" remarks about Roses. They do not require much sun ; in fact, such a hot burning week as we had last year at the end of June, though, as it happened, bringing many Roses to the Crystal Palace which would not otherwise have appeared, is most fatal as to the character and condi-tion of all the dark-coloured Roses.

The cold and wet of this year has damaged many a bloom in the bud. Roses are exceptionally late, though in many places exceptionally fine, and those of Mr. Baker's which I helped to judge at South Kensington on the 8th of July were certainly among the finest I ever saw. His stand of Marquise de Castellane was the finast of the variety I had ever seen, but he had also staged in the same box six very fine blooms of Marie

Baumann, and the latter carried the day.

To return to the weather. Rain and wind damage hundreds of blooms. Mine is a sheltered garden; every Rose tree this winter was killed down to the snow line, except a few as Gloire de Dijon, Charles Lefebvre, &c., on the south walls, and also some of the younger growth of last year of the hardiest sorts, and of which Edonard Morren, Marquise de Castellane, Dupuy-Jamain, Charles Lefebvre, Fisher Holmes, and a few others of that type proved the hardiest. Every La France I had, and every one of the Victor Verdier type, were cut down to the snow line; but, as all my Roses are on the Manetti and are mulched with manure, all—with the exception of newly planted Roses, which I had from nurserymen too late in the season in order to fill up gaps—are growing, and promise to bloom more than usually well; in fact I should not hesitate to show even against the great champion Mr. Baker either twenty-four or thirty-six in ten days' time, but I wait and hope we are going to have a week at least of fine warm weather, and there is no fear of too much sun this year, so pace Camm. Though I can partly agree I cannot accept his sweeping assertions, and it is not pleasant to be cutting one's first Roses, even in north-east Yorkshire, on the 12th of July, and those only old blooms, which is the case this year.

Mr. Cant was in very good form at Manchester, especially in his seventy-two, where there was hardly a bad bloom; Paul and Son very good in forty-eight trebles; and Cranston to the fore. But weather has told against Herefordshire. Those who depend on seedling Briars as stocks have little chance this backward season, though perhaps on strong soils and heavy clays their time may come later. Messrs. Baker and Jowitt were in strong force, the latter winning in the thirty-six, and being a very good second in the twenty-four; not much to choose. Canon Hole, unfortunately not there to greet us with his genial presence, sent a very fine dozen of Teas and Noisettes. Among newer Roses Alfred K. Williams is an undoubted acquisition. Messrs. Paul showed their grandly coloured seedling Duke of Teck. The weather was unpropitious, for rain fell in torrents—the usual luck of shows this year.—C. P. PEACH.

NOTES AND GLEANINGS.

SEVERAL pretty and useful HERBACEOUS PLANTS are now flowering in Messrs. Osborn & Sons nursery at Fulham, and indeed it is scarcely possible to visit this old nursery at any time without finding something of interest to the lover of plants. Potentilla William Rollisson is extremely bright, plants. Potentilla William nomisson is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers; P. Menziesii is also good, with numerous rich scarlet flowers rich the colour of the flowers being somewhat darker. Geum coccineum plenum is another showy plant for the borders. Three Dianthuses attract attention-viz., D. dentatus, medium flower, delicate pale pink, pretty; D. deltoides, rich dark pink, flowers numerous; D. Napoleon III., a fine variety, flowers well formed, glowing crimson. Many Campanulas were in flower. One dwarf form was particularly noticeable; it was named C. pumila, but we believe it to be the C. pusilla of continental nurserymen. It grows 7 or 8 inches high, and bears pendulous blue flowers, like a diminutive Canterbury Bell. There is also a white variety. Both are very floriferous and exceedingly pretty in a border, and would no doubt succeed in pots.

- ONE of the finest displays we have seen of the attractive flowering shrub KALMIA LATIFOLIA was in Miss Christy's garden at Coombe Bank. The shrubs were originally planted out in the borders, but were removed and planted in a large round bed on the lawn. That bed has for some time past been very beautiful, the varieties ranging from pure white to deep pink, some of the heads of flowers being nearly a foot in diameter. The soil is a light gravelly loam. This bed of Kalmias has for some time past been the finest feature in the garden, attracting even more attention than the Roses, which Mr. Moorman grows so well.

MR. H. HUSSEY VIVIAN says, in his "Notes of a Tour in America," that in the vegetation he was most interested by discovering "the RHODODENDRON growing wild in its native woods among the Alleghanies, forming a large portion of the undergrowth, especially in the bottoms. The coal measure soil there is its natural habitat. No wonder it flourishes so luxuriantly in Glamorganshire."

- FOR early summer decoration of the conservatory few

plants are more useful and effective than HYDRANGEAS flowered in 5-inch pots. These plants are grown in immense numbers and of remarkable quality for the London market, and occasionally are found equally good in private gardens. Some of the best we have seen this year were in the conservatory of Ewell Castle, grown by Mr. Scutt the gardener. Several of the heads exceed 3 feet in circumference, and some of the individual flowers which we measured were upwards of 34 inches in diameter. Dwarf Hydrangeas are so easily produced, that it is a little surprising they are not more frequently seen in fine condition in country greenhouses and conservatories. A brief outline of their propagation and culture is given in another column in reply to a correspondent.

- ALL who have to provide striking and beautiful flowering plants for corridors, conservatories, &c., at this period of the year should not omit growing for that purpose the HORE-IN-HOSE varieties of CANTERBURY BELLS. Blue and white pyramids of Campanula Medium calycanthema are extremely beautiful, and there is just time for producing plants that will flower well next year; but not a day should be lost in sowing the seed; indeed, for forming large and imposing specimens the plants should already be pricked off. The seed should be sown very thinly in pans of light rich soil, and if kept constantly moist, the seed pan being covered with a square of glass, the seed will germinate quickly. The seedlings after being established in small pots should be shifted into larger as quickly as possible, and be grown in the open air the same as Strawberries for forcing or Chrysanthemums. The plants now so attractive in the Ewell Castle conservatory were raised from

seed sown last year on July 16th.

· In the gardens above referred to the mode adopted of preserving STRAWBERRIES FROM DECAY on account of the continuous rains is worthy of note, not because it is new, but because of its manifest usefulness. The crop of Vicomtesse Hericart de Thury is a prodigious one, and had the fruit been permitted to remain on the ground half of it would have been lost. In order to preserve it Mr. Scutt had three or four short stakes inserted round each plant, and to these the fruit trusses were loosely but securely fastened; the fruit is thus all exposed above the foliage, and the Strawberry beds present an attractive and remarkable appearance. The work of tying up the fruit is a little tedious, yet no labour is more profitable during a season like the present. Although much fruit is already spoiled by the wet, yet much more may be saved in many gardens if some such practice as that referred to is promptly adopted.

- THE AMATEURS' CHAMPION CUP, given by Messrs. Pegler at the NORWICH ROSE SHOW, was won by Mr. R. N. G. Baker, and not by Mr. Jowitt, as was inadvertently stated in the report of that Show.

- On a sculptured stone at Llanidan in Anglesea is this inscription :-

\begin{cases} \locatus in \\ \damnatus ex \\ \text{humatus in} \end{cases} \text{Horto.} Homo renatus in

Thus recording that "Man was placed in, was condemned from, was buried in, and re-born in a garden."

MR. CARTWRIGHT, the Honorary Secretary of the Leek Rose Society, informs us that the LEEK ROSE SHOW is again postponed from July 22nd to 29th, and that the NEWCASTLE-UNDER-LYME SHOW is postponed until August 2nd.

THE members of the PELABGONIUM SOCIETY WILL DINE TOGETHER at the Hotel, Swanley, on Wednesday next, and would be pleased to find that some of their horticultural friends would join them; those desirous of doing so should at once communicate with Mr. Cannell, at the Nurseries, Swanley, Kent. The Society purpose visiting Mr. Cannell's nursery and the fruit fields adjoining. It may be interesting to state that one farm in this neighbourhood sent fifteen tons of Strawberries in one day last week to the London markets. Dinner 4 P.M., 5s., exclusive of wine.

THERE is to be a great INTERNATIONAL EXHIBITION OF ROSES at Brie-Comte-Robert on the 6th, 7th, and 8th of September next, and all who intend to exhibit are requested to give notice of their intention fifteen days previously to the Vice-President, M. Camille Bernardin, Brie-Comte-Robert

(Seine-et-Marne).

- Mr. BATEMAN of Westcombe Lodge, Wimbledon, has succeeded Mr. George Easton as gardener to M. R. Smith, Esq., Headlands, Wimbledon Common. Mr. GEORGE PAGE, foreman at Canford Manor, Wimborne, has been appointed head gardener at Chelston Manor, Torquay. Mr. Thomas Knowles, Castle Coole, Ireland, has been appointed gardener to G. H. Morrell, Esq., Headington Hill Itall, Oxford. Mr. Thomas Sheasen becomes gardener to the Archbishop of Armagl, The Palace, Armagh; and Mr. A. Young foreman at Bloxholm Hall, Sleaford, head gardener at Holme Lacy, Hereford, the beautiful seat of Sir Henry Scudamore Stanhope, Bart.

In many vineries which we have inspected this year we have observed a singular ABSENCE OF LEAVES AT THE LOWER PORTIONS OF THE LATERALS close to the main rods, and consequently the eyes or buds to which the laterals are usually pruned are not by any means so prominent as is desirable. For an inch or two at the base of the laterals there are, in a majority of instances, either no leaves to support the buds, or the leaves are only about an inch, or even less, in diameter, and can be of no real use in aiding the development of the buds for producing the next year's crop, when the Vines are pruned on the close-spur system. We mention the circumstance in order that attention may be directed to the subject, which is a somewhat important one. Without bold plump eyes strong breaks and fine bunches can hardly be expected, and in order to secure such buds it may be necessary to leave the spurs on certain Vines somewhat longer than is customary at the next pruning. The absence of the basal leaves in question is no doubt the result of the extraordinarily cold and especially dull weather that prevailed in early spring when the Vines were starting into growth; at any rate it has occurred in the case of Vines which are in the first condition of health generally, and under the most careful and competent cultivators.

"BUENHAM BEECHES" will be the title of a little volume (from the pen of Mr. Francis George Heath), to be published in a few days by Messrs. Sampson, Low, Marston and Co. Amongst the illustrations will be included four wood engravings, copied by special permission from Mr. Vernon Heath's famous photographs of Burnham Beeches, representing Spring, Summer, Autumn, and Winter.

— As an illustration of the unproductive nature of the present season, Sir E. W. Watkin, M.P., mentioned at the meeting of the South-Eastern Railway Company that last week alone the traffic for the conveyance of fruit over that line showed a falling-off to the extent of £500.

— REFERRING to the article on "Cowper as a Gardener" (page 42), a correspondent informs us that the poet removed to Weston Underwood in November, 1786, and not to Merton as was madvertently stated in the article referred to.

THE seventh annual Exhibition of the WOODFOBD HORTICULTURAL SOCIETY which was held on the 16th inst. in the beautiful grounds of J. Spicer, Esq., The Harts, Woodford Green, was, we are informed, a very good one, and was visited by an immense number of spectators. The highest amount was received for admission since the formation of the Society, and much credit is due to the Secretary and Committee for the highly satisfactory manner in which they carried out the arrangements.

ROYAL HORTICULTURAL SOCIETY.

JULY 22ND.

OWING to the Carnation and Picotee Society's Exhibition having been postponed, this meeting was one of only ordinary interest, although the Council-room was rendered bright by the collection of new plants, cut Roses, &c., from Messrs. Veitch, Williams, Bull, Barr & Surden. Cannell. &c.

Barr & Sugden, Cannell, &c.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. Mr. Carmichael, gardener to H. Porteus Oakes, Esq., Newton Court, Bury St. Edmunds, sent a handsome-looking Melon beautifully netted, and with an orange-coloured thick flesh. It was called Victory of Bristol. The skin is of a fine rich yellow colour and thin, but the flavour was not so good, in consequence, it was supposed, of the unfavourable season. The Committee expressed a wish to see it again this season if the weather should improve. Mr. J. Thrower, gardener to D. Gurney, Esq., North Runcton Hall, Lynn, sent a well-netted Melon with a green flesh and of good flavour, but not superior to other varieties in cultivation. It was thought to be over-ripe, and the Committee expressed a wish to see it again. Mr. Donaldson, The Gardens, Stoodleigh Court, Tiverton, sent two seedling Melons, neither of which was possessed of any merit. Mr. S. Woods, The Gardens, Osberton Hall, Worksop, sent fruit of Vanilla, to which a cultural commendation was awarded. Mr. J. Atkins, The Gardens, Lockinge Park, Wantage, sent a fine dish of well-ripened Albert Victor Nectarines, and was awarded a cultural

commendation. A fine dish of Hautbois Strawberries was exhibited from Chiswick.

FLORAL COMMITTEE.—Dr. Denny in the chair. The group of plants from Mr. B. S. Williams included several that were deserving of notice, such as Bromelia Binotii, a distinct and peculiar plant, with pendulous glossy leaves 3 to 4 feet long bordered with strong spines, the young leaves being a bright red colour, and the same colour tinges the older leaves for a great part of their length—first-class certificate. Anthurium Walnewii has large cordate leaves of a metallic green hue, rather elegant. The plant was referred to the Scientific Committee. Encephalartos Williamsi, leaves stiff, with narrow glaucous pinnse; Adiantum mundulum, a dwarf and elegant Maidenhair Fern. Mr. Bull's collection was characterised by a number of novelties of especial merit, the most important of which were the following:—Coleus James Barnshaw, neat habit, foliage streaked with crimson and yellow; Sarracenia atrosanguinea, narrow pitchers, 1 to 2 feet in height, the "lids" dark purplish red, distinct; Tradescantia multicolor, after the character of zebrina, leaves streaked with green, white, and a lake tint. For all the above first-class certificates were awarded. Several other noteworthy plants were shown, as Lilium Brownii, bearing flowers of medium size, with white recurved petals; the interesting glossy-leaved Acacia spherocephala, with numbers of its hollow spines; the brilliant Hæmanthus Kalbreyer; and the graceful Cycas siamensis.

petals; the interesting glossy-leaved Acacia spherocephala, with numbers of its hollow spines; the brilliant Hæmanthus Kalbreyeri; and the graceful Cycas siamensis.

Messrs. James Veitch & Sons sent eight boxes of cut Roses, including a number of excellent varieties, many of which were well represented—for instance, John Hopper, Dupuy-Jamain. Beauty of Waltham, Duke of Edinburgh, Marguerite de St. Amand, Marie Baumann, Général Jacqueminot, Louisa Wood, and Auguste Neumann. A silver Banksian medal was awarded for this fine collection. Mr. H. Cannell, Swanley, Kent, received a vote of thanks for a collection of cut blooms of Fuchsias, Sweet Williams, Verbenas, and Tuberous Begonias, the latter being very good in colour and form. Mr. Henry Hooper, Vine Nursey, Bath, received a similar award for a collection of Carnations, Ficotees, and Pinks. A cultural commendation was awarded to Mr. J. C. Spyers, Orchid-grower to Sir T. Lawrence. Bart., M.P., Burford Lodge, Dorking, for Odontoglossum coronarium, planted in a long narrow box and bearing an extremely fine spike of flowers, the sepals and petals of which are bright pale brown marked with yellow at the base and with crisped margins, labellum pale yellow. Pescatoria Klabochiana was also shown, and a first-class certificate was awarded. This plant was bearing two or three Bollea-like flowers, only the colour is whitish, the tips of the sepals being timed with a dark purollish tint.

tinged with a dark purplish tint.

Mr. R. Lloyd, gardener, Brookwood Asylum, Surrey, exhibited a number of new Coleuses, and one, Dr. Brushfield, received the honour of a first-class certificate. This variety is of strong growth, leaves large, very deeply and obtusely serrated, clouded and veined with crimson, with darker spots, and a pale yellow margin; the others were not sufficiently distinct to receive any special award.

J. Elwes, Esq., of Cirencester, received a first-class certificate for a handsome Lily, a variety of L. Kæmpferi. The flowers were very large, 6 to 7 inches in diameter, the perianth divisions white ground colour yellow at the base, spotted and clouded with purple near the margin. A box containing eight blooms of a seedling Rose was exhibited by Mr. R. Ward of Ipswich. It was named Isabella Ward, and said to be a seedling from Baronne de Rothschild crossed by Sombreuil; of strong habit, and flowers well in autumn. The flower was rather loose, but of a delicate blush white colour. A second-class certificate was awarded. Messrs. Wm. Paul & Son, Waltham Cross, sent a box of new Roses, none of which, however, were very distinct. A vote of thanks was accorded to Messrs. Barr & Sugden, Covent Garden, for a number of Iris blooms of good size. Mr. C. Turner, Slough, received a second-class certificate for Carnation The Queen, a neat white flower with a few pink streaks. A number of Pelargonium blooms also came from the same firm.

EXOCHORDA GRANDIFLORA.

THIS remarkably handsome shrub is one of the numerous valuable additions to our garden plants for which we are indebted to the assiduous collector Mr. Fortune. He first discovered it in the northern part of China in the year 1845, and some short time afterwards he found it in the Che-kiang Hills, and the specimens collected were despatched to Messrs. Standish & Noble of the Bagshot Nurseries under the name of Amelanchier racemosa. It flowered at Bagshot in 1854, and then attracted considerable attention owing to the profuseness with which the flowers were produced and the length of time that they continued in beauty. From examinations then made the name Amelanchier racemosa was found to be inaccurate, and the plant was referred to the genus Spiræa under the name of S. grandiflora, but from certain characters of the fruit the present generic title was finally adopted.

The name being definitely determined general interest in the plant seemed to subside, and so we find that although more

Fig. 8.—Exochorda Grandiflora.

than twenty years have elapsed since its introduction it still remains comparatively unknown in gardens. This is the more unaccountable, as the merits of the shrub are of no ordinary character. When we have hardiness of habit combined with beautiful flowers and a lengthened period of blooming it is a little surprising that such valuable qualities should remain generally unobserved or neglected; still this is only one of the many instances which are constantly occurring to us of useful and attractive plants being gradually lost in culti-

The Exochorda is diffuse in habit, and occasionally requires a little pruning to keep it in form; and it can scarcely be surpassed for planting in shrubberies, as it rarely exceeds 9 feet in height and flowers freely during April and May. The specimen figured was taken from a shrub at Stillyans, the new resi-

dence of Lady Dorothy Neville in Sussex.

STRAWBERRY CULTURE IN POTS.

CONSIDERING how easy it is to grow Strawberry plants in pots, and the certainty there is of securing a fair crop of fruit from them with ordinary attention, it is a little surprising that Strawberries are not much more extensively grown in this way. As the season is unusually late there is yet time for preparing plants for fruiting in pots, though not, perhaps, for the earliest forcing, plants for which purpose being already fairly established.

The best of the runners produced by young plants should be selected for layering. Old plants, or runners of last year, should not be taken, as the younger plants do much better. The practice of layering the runners in the pots in which the plants are intended to fruit is no doubt a good one, but it is often more convenient to layer in 3-inch pots. The soil should be placed in the pots rather firmly to within half an inch of the rim, a mixture of loam and leaf soil or decayed manure in about equal parts being suitable; then plant a runner in each pot, securing them, if necessary, by a peg or stone.

During the time that the plants are producing roots the soil in the pots must be kept constantly moist by watering them once or twice a day according to the weather. When the plants are well rooted connecting runners should be severed, and shortly afterwards the young plants will be ready for the fruiting pots. They cannot be placed in these pots too soon, and as soon as they appear to have recovered from the effects of being separated from the parent plant.

This potting must be done with as much care as possible. Five and six-inch pots are the most suitable sizes to fruit the plants in. The smaller size may be employed for such varieties as Black Prince, which does not make much top growth, and the largest size may be used for President and Keens' Seedling. The pots should be clean and day. Drainage to about the depth of an inch should be placed in each pot, covering this with a thin layer of fresh horse-droppings. The mixture in which the plants should be potted may consist of good loam and cow dung in a rather fresh state well mixed. No sand or light material should be used. When cow dung cannot be obtained horse or pig manure may be used. A little of this mixture should be put over the drainage at the bottom of the pots, and rammed firmly down before the plants are put in. All round the ball of the plant the soil must be rammed firmly, leaving only about three-quarters of an inch depth on the sur-

After potting the plants may be placed where they have to make their growth in autumn. This position should be as much exposed to the sun as possible, and the pots should rest on a hard bottom, such as that afforded by coal ashes, boards, slates, &c. For a week or ten days, unless the weather is days, little or no water will be needed; but afterwards water must be supplied freely, as nothing injures or checks the plants so much as

allowing them to become too dry.

Should the few details given in the above remarks be attended to, a fine lot of Strawberry plants in poin will be the result by the end of October; and how to treat them for the next six months after that may be more seasonably told at that time.-A KITCHEN GARDENER.

RED ROSE VINERIES.

EVERY reader of the Journal must have made himself acquainted with the popular owner of this place through perusing the many able articles which he has from time to time contributed to its pages, but not everyone has an oppor-

tunity of seeing how Grapes are grown at the Red Rose Vineries. I cannot hope to give so graphic an account of the place as Mr. Wright did last year, neither is it necessary for me to travel over the same ground; suffice it, then, to say that with small exceptions the place is substantially the same as it was

I visited Mr. Witherspoon on July 2nd, and was at once shown the Grapes. To say that they equal last year's crop, and that is saying much, does no sort of justice to them. They are greatly superior to last year both in quantity and Probably the bunches are not quite as large inin quality. Probably the bunches are not quite as large in-dividually, but to my mind they are collectively very much larger than they were last year; notably the Lady Downe's, of which we were shown some splendid examples. Waltham Cross carries some fine bunches, beautiful in symmetry and large in berry. A young cane of Alnwick Seedling has eight bunches, which for size of berry equals, if it does not surpass, anything else in the house. The largest bunch is a Syrian, which probably weighed at the time of my visit half a stone. Of all the varieties that are grown here none seems to equal Gros Colman and Black Alicante. These were decidedly the best and most profitable Grapes last year, and to all appearances they will be the same this. The long rods of these two varieties, hanging covered with grandly shaped bunches and large noble berries, are very beautiful.

But to particularise is needless where all is up to-nay, sometimes beyond—the acknowledged standard of excellence. I may state, however, that in accordance with what I wrote last October the variety Mrs. Pince has again failed. This is the only exception in the house. The Vines on the back wall which carried such a crop last year are again well cropped, but not so heavily; but considering that the front Vines are this year several feet further up the rafters this is not surprising. One grand feature in this immense house is its cleanliness not a trace of vermin of any description; everything as clean and healthy as can be desired, and the young growth

already giving great promise of ripening off well.

In the unheated vinery, which by the way is used as an orchard house, a quantity of fruit trees in pots and tubs are growing. The majority of these trees, the reader will be aware, were severely injured by the frost last December, and although they are gradually recovering, the severity of the frost has left a memento. There is something rather curious about these trees which is perhaps worth naming. They all seem to have suffered most at from 3 to 5 feet from the ground level. In tall trees the middles are gone, while dwarf trees have their tops frost-bitten. While on this subject I may say that the Pears, of which Mr. Witherspoon had doubts, have fully borne out the Editors' assertion—that they would not bear fruit. After the fruit is apparently set it turns yellow about the footstalk, does not swell, and eventually drops off. The only Pears which have withstood the frost are the Hessle and Marie Louise d'Uccle; it is therefore quite fair to infer that these two varieties are possessed of a constitution considerably stronger than the majority of Pears. Although the Peach, Nectarine, and Plum trees suffered considerably, as remarked above, many of them are carrying a fair sprinkling of fine fruits. The only Peach on the back wall that has done at all well is Royal George, a valuable variety of a hardy constitution.

In the outside garden there is a grand prespect of small fruits, Gooseberries and Strawberries being particularly fine and promising. The crop of Apples, Pears, and Plums is light, owing to the injured fruit spars referred to. On the whole the place is a great credit to its owner, and when the fact that he is, strictly speaking, an amateur is considered, it appears doubly so, and we sincerely regret that a misfortune such as destroyed his fruit crop this year should have happened to him; but as Mr. Witherspoon is not a person likely to be discouraged by failures we feel confident that he will try to devise means whereby he will be able in a great measure to secure a crop, in spite of adverse circumstances and the strange vicissitudes of our changeable climate.—Peter Ferguson.

THE REIGATE ROSE SHOW .- "D., Deal," in his, to us here, very gratifying account of our Rose Show, from want of local information made two or three slight mistakes. It was the Redhill station he referred to, not the Reigate. The Show was held in the grounds of Mr. Waterlow; and the name of the young lady who deservedly gained so much praise for her exquisite and successful table decoration is Miss Flora Thornton, not Miss Thompson. I am sure "D., Deal," will forgive me for thus assuming the right to correct so great an authority as himself.—JOHN PAYNE, Treasurer of the Reigate Rose Association.

ANTHURIUM SCHERTZERIANUM.

This is one of the most free and useful of stove plants, and does not require nearly so much heat and coddling as many others less pretentious. There are many forms of this plant large and small flowered, light or high coloured, red or yellow in the spadix—due in great measure to the raising of plants from seed. It is not advisable, except for purposes of increase, to allow plants to form and mature seeds, as it retards their growth more than anything short of absolute neglect. Remove the flowers, therefore, as soon as they fade when seed is not required. If the object is to raise plants from seeds, eight or nine months will elapse before the seed is mature; it will then require to be washed clear of the pulp. Sow in pans half filled with drainage, filled to the rim with chopped sphagnum mixed with a fourth of peat and a sixth of sand, press it well down, give a good watering, and again press so as to form a smooth surface, on which scatter the seeds. Keep the soil constantly damp, and shade from powerful or direct sun. In a warm house not less than 60° at night the seedlings will appear in a few weeks, when they should have more light, and when large enough to handle prick them off in pans prepared as for sowing the seed; only half instead of a fourth of peat should be employed with the sphagnum and sand as before. keep the young plants growing, and when large enough pot them off singly in 3-inch pots, giving preference to the strongest plants, as they invariably afford the largest and best spathes. Now is a good time to afford additional pot room to any plants requiring it. They succeed in a porous moisture-holding material, such as equal parts of lumpy peat and chopped sphagnum, with a sixth of crystal sand, and a little lumpy charcoal. Being a surface-rooter much soil is not necessary, but it is necessary that the drainage be thorough to allow of the water passing away freely.-G. A.

AN AFTERNOON AT KEW.

WANDERING about the lovely gardens at Kew one might fancy oneself hundreds of miles away from London, particularly when you seek that part of the gardens that I did. Few of the holiday folk trouble the herbaceous department. The people want gaudy flowers and glass houses, not beds for the most part full of flowers which at first sight seem little better than weeds; so they keep near the Palm house and the gay beds that fringe the lake. Only a gardener or two and a student like myself are to be found here. A policeman puts his head in for a moment, but seeing only a poor parson and another man with a book in his hand he thinks he may leave us alone, so vanishes.

Half in shade are the beds, for the noble Elms temper the sun's rays and shade half the garden, so that it is under the most favourable circumstances I set to work to note some of the most prominent flowers. Here I must own I made a mistake in coming without a book on hardy flowers. Such a work as that of Mr. Sutherland would be of the greatest assistance as a book of reference m which to mark down flowers in bloom, for all the beds are arranged according to the natural order of the flowers. The Composites are together, the Amaryllids by themselves, so that it is only necessary to turn to the pages where the order is treated of to verify the flowers. Distinct well-written labels mark every flower, and a visitor may learn more in an afternoon at Kew than from weeks of study at home.

My principal object in visiting Kew was, however, the Iris, and here I must say I was disappointed. I expected to see far more in bloom than I found. I was a little late it is true, for agrest number of the barbata family were over, still I expected to see many more than I did. I was delighted, however, to find several blooms of the original Iris Kæmpferi. This is so shy a bloomer that I found none at Tooting, but at Kew the one plant had several fine flowers. I found one bulbous Iris in bloom which I had not seen at Tooting. It is Xiphion lusitanicum. It has bright yellow standards with deep orange falls. Iris plicata was in bloom. It is a beautiful specimen of the bearded section; the standards are white margined with lawender.

I found also one or two surly-blooming varieties of Gladiolus.

In the general herbaceous beds I found good blooms of Baptisia australis, Galega orientalis, Epilobium angustifolium, white, something like a single Rocket. The beautiful white Lilly-like bloom Anthericum Liliago and several specimens of Hemerocallis were among the most striking blooms. I was a little disappointed with the display made by the Delphiniums and Campanulas, though there were several in bloom. I found fine examples of Phlox pilosa and P. carolina in bloom, also Anchusa and many varieties of Digitalis but in no way superior. The Pentstemons were just coming into flower, also the

Salvias. The different species of Armeria were in full bloom. After the Iris bed I was most interested and pleased with the Aquilegias. I found here that gem which I have often read of but never before seen—A. chrysantha cserulea. This is a beautiful variety of A. chrysantha. The petals are light blue, while the spurs are primrose; the combination of colour is most delightful. There was another novelty—A. californica hybrida. This has yellow stamens and red orange spurs. A. olympica, another novelty, is rather like A. glandulosa with short spurs, but the petals are veined with primrose instead of blue. I found also a white Poppy (Papaver alpinum), and several rare species of Clematis ovata. Some grand herbaceous Geraniums made the rockery quite gay.

There were not many aquatics in bloom. The principal one was the well-known Water Hawthorn (Aponogeton distachyon); but I found one gem, a Primula, growing in a pot plunged in the water. It is called Primula luteola, and has primrose or pale yellow trusses of flower about the size and colour of the wild Oxlip.

There were, of course, very many more herbaceous plants in bloom at Kew at the time of my visit, but the list would be too long for your space. I have endeavoured to mention a few of the more leading sorts which I noted down, and which I hope may not be unacceptable to your readers. I know no more delightful place to spend a summer afternoon than these gardens; and when you combine business with pleasure, and try and stock your mind with knowledge at the same time as you fill your lungs with oxygen, you find the time slip away most pleasantly, and return home a fresher if not a more cultivated—WYLD SAVAGE.

ROSES, WALL FRUITS, &c., IN WALES.

In a note in the Journal of Horticulture for May 1st, on the effects of the late severe sesson on Tea Roses, I mentioned that those which were uninjured would bloom better than usual, at least in this district; and that expectation has been verified, for the more hardy have been covered with a profusion of blooms which for once has been sufficiently late to escape spring frosts. Belle Lyonnaise and Maréchal Niel have surpassed all others; of the latter 470 blooms have been cut from the two largest trees, and many still remain. It has shown its Noisette character by clustering, but these were all disbudded, as our Roses are required by the family during the London season and are cut as single blooms. Many of the more tender Teas that suffered most are now making good growth, and Hybrid Perpetuals are looking all the better for being later, especially maidens.

The season is certainly very backward, but if we only have good weather to ripen fruits we shall have better crops here than for years past. Apricots show a heavy and healthy crop. Peaches have also a good crop, but the foliage and growth are poor, and as the stoning is in progress some loss may yet be expected. The growth generally is slow and the foliage small, yet I have not seen a single leaf affected with blister. Can it be that the continued cold has suited them, in that respect at least, better than sudden changes? In previous years with more healthy growth there has always been more or less of blistering. Of the newer varieties Dr. Hogg Peach and Lord Napier Nectarine seem to be the hardlest, having made splendid healthy growth in defiance of the prolonged cold. Cherries, both sweet and Morellos, have heavy crops. Pears unprotected are a failure or nearly so, but where a covering was employed they have set well and one swelling freely; while Quinces, which bloom much later, have a crop for the first time for years. Apples are very variable in the garden: one tree is heavily laden, the next has none, but there is a good average yield in the orchard. Plums, except Victoria, of which I grow most, are scarce, this result arising from deficient bloom and not from frost. All small fruits have, without exception, heavy crops. Figs are not satisfactory; some trees of Brown Turkey have half a crop, while six trees of Brownwick and White

Marseilles bear little but leaves this season: all are on a wall with a west aspect. Some were bundled and well thatched with straw, others were left last winter without any protection; these are rather better in each variety. Those that were protected broke into growth a little earlier. It is probable that the embryo Figs were also sooner on the move, thus incurring greater risk of injury from frost. Such useful additions to the dessert as Mulberries, Medlars, and Walnuts promise to be plentiful.-R. C., St. Fagans, Glamorganshire.

WORK FOR THE WEEK.

KITCHEN GARDEN.

ALTHOUGH the weather has been so long cold and wet Potatoes are growing strongly, and there is little or no trace of disease; but there is a great need of bright weather to check the growth and induce the production of tubers. The lateness of the Potato and Pea crope will retard the planting-out of Broccoli, &c., and as the season is fast passing away it is necessary to proceed in planting Cauliflowers for autumn use, also Broccolis, Savoys, and other description of greens for winter and spring use, planting either between the rows of Potatoes or in any vacant ground that either between the rows of Forenoes of many beautilable, from which they may be removed as the ground becomes cleared of Peas and Potatoes. The latter if they are may be available, from which they may be removed as the ground becomes cleared of Peas and Potatoes. The latter if they are attacked by disease should be lifted without delay, as to leave them in the ground is to endanger the whole crop, whilst lifting will arrest the progress of the disease. Carefully pick out the diseased tubers and store away those that are sound. The tubers of medium size should be selected for sets, placing them think in a dry size should be selected. thinly in a dry airy shed. Ground should be reserved, and where practicable prepared for the main crop of autumn-sown Onions and that very important crop Winter Spinach. A sowing of early Cabbage should be made without delay, and a good sowing should also be made of such hardy kinds of Lettuce as Bath or Brown Cos (black-seeded), Bath or Brown Sugarloaf Cos, and Stanstead Park, which will afford a late supply. The earliest Scaling the state of the state of the state of the state of water at the roots, and that the leaves are kept close together. Later crops should only have a moderate earthing to keep the plants steady, and if the plants be dusted with soot whilst damp it will help to ward off attacks of the fly. The planting-out of late crops must be proceeded with and brought to a close as soon as possible. Rosette Coleworts will be ready to prick or plant as possible. Rosette Coleworts will be ready to prick or plant out from the seed beds. Chervil and Corn Salad sown now will stand for the best part of the winter, preferably in a sheltered border. When ready take up Garlic and Shallots, spreading them on the surface of the ground for a few days, so that they may be well dried. Similar remarks apply to the earlier kinds of autumn-sown Onions, the general crop of which will not be ready to pull for some time yet. Tomatoes, when they have covered the allotted space, should be well thinned of the large leaves and stopped a joint beyond the trusses.

HARDY FRUIT GARDEN.

The various kinds of fruit trees trained to walls should be frequently looked over, nailing or tying in leading shoots, and removing or stopping any not required. The undue production of wood must be restrained by timely stopping or removing strong forerights altogether. Apples have in some instances set a good crop, such as Keswick Codlin, Lord Suffield, Cox's Pomona, Warner's King, Cellini, Holland Pippin, Yorkshire Greening, Hunthouse, Cockpit, Dumelow's Seedling, and Northern Greening in culinary kinds; Irish Peach, Devonshire Quarrenden, Kerry Pippin, King of the Pippins, Cox's Orange Pippin, Court of Wick, Syke House Russet, Golden Russet. Reinette du Canada, Adams' Pearmain, Cockle Pippin, Duke of Devonshire, Dutch Mignonne, and Sturmer Pippin in dessert kinds. The season is, however, so far advanced and the weather so unfavourable, that unless we are favoured with very fine weather the crop will be of little value. The growth very fine weather the crop will be of indict very should be kept well thinned, so as to admit light and air to the should be about three leaves. The snould be kept well thinned, so as to admit light and air to the spurs, keeping the shoots stopped to about three leaves. The different kinds of bush fruit will need to be carefully netted to preserve them from birds; also late Cherries. Continue to pot runners of Strawberries for making new plantations about the middle of next month, or as soon as the plants have filled the pots with roots. Forced plants that were planted out in May and early June should have the runners removed and be well mulched, and they will afford on acceptable autumn says if the worther. and they will afford an acceptable autumn crop if the weather should prove favourable.

FRUIT HOUSES.

Melons.—If fruit of these be required very late a last sowing should now be made, but unless there be a light and well-heated structure available the prospect of a crop will be indifferent. The batch of plants for fruiting in October should be planted at once, it being equally necessary that they have a light well-heated structure. If the weather be bright and the temperature at night does not fall below 659 6m between the dispendent with the contract with the contract with the structure. at night does not fall below 65° fire heat may be dispensed with, only it is necessary that the bottom heat, if derived from fermenting materials be 90°, and 80° to 85° if from hot-water pipes; the

temperature of the house by day 70° to 75°, advancing with sun heat to 85° or 90°. In pits or frames the last batch will now be setting their fruit, and a good watering should be given before the flowers open. If watering is necessary during the time the fruits are setting it should be done carefully, as a dry atmosphere with rather free ventilation is essential to a good set. Syringe growing crops, always except during the setting and ripening periods. As soon as the fruit of the different crops are set and swelling earth up the plants firmly. Keep the growths well in hand after the fruit commences to swell so as to admit light and nand after the fruit commences to swell so as to admit light and air to the principal leaves, also stop all lateral growths to one joint. If canker appears at the collar promptly arrest its progress by rubbing the part with quicklime; and if there be any evidence of the fruit cracking cut the vine half through a few joints below the fruit, reducing the supply of water at the root and maintaining a dry well-ventilated atmosphere.

Pines.—Take advantage of the clearing-out of the plants which

were started into fruit early in the year to give the successional plants more room. The fermenting materials will, if they were renewed in spring, only require the turning of the bed to a depth of 18 inches, but beds that were not renewed in spring should have a foot of new tan mixed with the old to a depth of 18 inches. The suckers from the fruited plants above alluded to will be in a fit state for potting, but before doing so a pit having a fermenting bed with a bottom heat of 90° must be in readiness to receive In potting ram the fibrous loam firmly in the pots and round the base of the sucker. Water and place the plants in the bed, bringing the plunging material over the surface of the potse as to secure them against becoming dry at the top, and to prevent having recourse to watering again until roots are formed. The plants must be effectually shaded from powerful sun, and the pits ventilated at 85°. Lightly syrings the plants overhead occasionally.

PLANT HOUSES.

Store.—Eucharis amazonica is indispensable where the demand for cut flowers is considerable, and with a sufficient number of plants it can be had in bloom through the year by growing and resting a portion of the plants at different seasons. Plants that bloomed early and have since made and completed the growth should be rested. Place the plants in a temperature about 10° lower than that in which they have been grown for five or six weeks, allowing no more water than to prevent the foliage suffer-ing, after which return them to heat and they will quickly throw up their flowers. If cuttings be now taken of Poinsettias, short stubby shoots of about 4-inch lengths with heels and inserted in sandy soil, they will root quickly in gentle heat kept rather close, making nice sturdy plants grown on in plenty of light and not too much heat. The Tuberous-rooted section of Begonias, though best treated as temperate and hardy subjects, are suitable for a display in this structure early and also late in the season. Seedlings from seed sown in spring and grown on in gentle heat, if shifted into larger pots as they require it, giving the last shift as the plants show bloom, and grown on shelves near the glass, will make a grand display late in the season.

make a grand display late in the season.

Greenhouse.—For room decoration nothing is so well adapted as Palms, Dracænas, and other foliage plants, and it is surprising what a time they will keep in good condition if properly watered. Of Palms Corypha australis, Latania borbonica, L. aurea, Phœnix reclinata, P. tenuis, Pritchardia filamentosa, Seaforthia elegans, Kentia Fosteriana, Areca Baueri, A. rubra, Sabal Adansoni, and Thripar, parviders, may be automated as withly when in a small property of the company o Thrinax parviflora may be enumerated as suitable when in a small Thrinax parviflora may be enumerated as suitable when in a small state, in which they may be kept by restricting the root room, there being no necessity to afford large pots unless the object be to grow the plants on as quickly as possible. To the Palms may be added Aralia leptophylla, A. quinquefolia, A. reticulata, Dracena australis, D. rubra, and D. congesta, Beaucarnea recurvata, Yucca filamentosa variegata, Y. quadricolor, Y. aloifolia variegata, Y. filifera, and Y. Stokesi; Aspidistra lurida variegata, Casuarina sumatrana, Lomatia elegantissima, L. salicifolia, and L. ferruginea, Figure elastica Eurya latafolia variegata Gravillea Hilli G. elegans Ficus elastica, Eurya latifolia variegata, Grevillea Hilli, G. elegans and G. robusta. The last with Lomatias having foliage of the most elegant description will not bear being kept continuously in the dwelling house like the harder Palms. Plants intended for room decoration should be grown in light airy positions with no more heat than to keep them in steady growth, insuring their full development. Encourage Chrysanthemums by the use of liquid manure every other time they require water, so soon as the roots get fairly hold of the soil after being placed in their flowering pots. It is a practice with some to plunge the pots, thinking that it saves watering and maintains more uniform moisture at the roots, which is no doubt correct; at the same time, with proper attention in watering there is less danger of the plants rooting through when placed on a hard bottom, and the wood is shorter jointed. On no account must the plants be allowed to lack water, for if they do the lower leaves will suffer.

Early-flowered Pelargoniums should be placed outdoors in the full sun to thoroughly ripen the wood previously to cutting them down. Propagation may be proceeded with, as the cuttings strike freely whilst the foliage is fresh and green. Insert them in sandy soil, and place the pots in a half-spent hotbed, and they speedily

produce roots. Lilium auratum coming on for later flowering will now require copious supplies of water, and should have top-dressings of old cow dung or well-decayed manure, and the plants supported with sticks. L. speciosum vars. should have attention in tying the stems well out where a number of bulbs are grown in a pot. Keep a vigilant watch for aphides, mulching the surface with rich material, and keeping the plants well supplied with water and occasionally with liquid manure. Plants of Liliums that have flowered should be placed outdoors and duly attended to with water, as the longer the foliage is kept healthy the greater is the strength accumulated in the bulbs, and the the greater is the strength accumulated in the builds, and the stronger will next season's growth and blooms be. Cinerarias and Primulas for autumn flowering should receive their final potting before they become rootbound, placing the pots on a hard bottom of ashes in a cold frame. Water copiously, and occasionally with liquid manure, as the stronger the plants the finer will be the bloom. Keep them cool by free ventilation, and afford shade in the middle of the day. Sow herbaceous Calceolaries in pots or pans, and place them under a handlight in a shady situation to lessen the necessity for watering. Chrysanthemums must be staked and tied up as they advance in growth, for if neglected in that respect they are liable to be broken by the wind; and when the pots are filled with roots afford liquid manure at every alternate watering, or not more distantly than once a week. Zonal Pelargoniums intended for autumn and winter flowering should he at once potted and plunged in ashes outside. Stop the shoots if necessary to induce compact growth, and supply liquid manure occasionally to enable them to make good growth. Young vigorous plants of Fuchsias are the better for being plunged in ashes outdoors, as full exposure to light and air consolidates the growths and causes them to produce good foliage and blossoms.

FLOWER GARDEN.

Flower beds are not in nearly so satisfactory a condition as is usual at this time of year, but such moisture-loving plants as Calceolarias, Violas, Lobelias, &c., are thriving and have caused little trouble in watering so far. Seed pods and decayed flowers should be removed; indeed all bedding plants should have the seed vessels removed as soon as the petals fall, as the production of seed tends greatly to the exhaustion of the plant. Verbenas should be kept well pegged down until the ground is covered. To have fine beds of these they must be frequently picked over and kept well thinned by nipping a portion of the shoots back, so as to admit light and air and thus induce fresh young growth. Such free-growing plants as Mesembryanthemum condition variegatum, Stellaria gramines aurea, and others employed for carpet bedding, soon encroach on less vigorous plants if not frequently pinched-in. The effect of carpet bedding is greatly marred if the lines, &c., forming the patterns are not kept clear and distinct. Flower beds are not in nearly so satisfactory a condition as is

TRADE CATALOGUE RECEIVED.

Louis Van Houtte, Ghent, Belgium.—Catalogue of Miscellaneous

TO CORRESPONDENTS.

** All correspondence should be directed either to "The Editors" or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense. Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects,

and should never send more than two or three questions at All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post

SEEDLING PLLARGONIUM (G. W. A.).—The flower of the Show Pelargonium had shed the whole of its petals, and we are consequently unable to ferm an opinion of its merits. Had you applied a drop of gum to the base of the petals the flowers would have arrived in good condition. We may, however, observe that there is nothing very remarkable in the colour of the petals; and unless the flower is of exceptionally good form and the plant of good habit, the variety will not be equal to those already in commerce.

good habit, the variety will not be equal to those already in commerce.

SHOW PELARGONIUMS (Amateur, Oxon).—As the flowers are fading remove all the trusses, syringe the plants thoroughly to cleanse them from insects, and place them in a sunny position out of doors, only watering them occasionally to prevent the leaves shrivelling and falling prematurely. They will then ripen their wood. As soon as the shoots are brown and hard cut down the plants to within an inch or less of the part to which they were pruned last year. If the rains are not excessive the plants may remain out of doors to break; they are better, however, if they are in frames, so that the lights can be placed over them during drenching rains. When they have grown about half an inch shake them out of the pots, slightly shortening any straggling roots, and pot the plants firmly in smaller, well-drained, clean pots, watering sparingly for a time, and keeping the plants rather close until they recover from the check they have received; then give air plentifully and water more freely, yet with care, and they will shortly become sturdy healthy plants in fine condition for passing the winter and for flowering next year. flowering next year.

HYDRANGRAS (A Young Gardener).—If stout short-jointed cuttings are inserted now and kept in a close place until rooted they will form dwarf plants that will produce fine heads of flowers next year. The cuttings

should be inserted singly in 3-inch pots, and when these are filled with roots the best of the plants may be shifted in 5-inch pots, the others remaining in their cutting pots until spring, when they can be shifted as soon as the flower heads are visible. The plants during the summer should be placed in a sunny position out of doors, simply watering them as required: the growth will then become matured, and flower heads will form. Dwarf Hydrangeas are very useful for decorative purposes in early summer. When the flower heads form in the spring the plants require copions supplies of liquid manure; they then produce healthy foliage and large flowers.

they then produce healthy foliage and large flowers.

PLANTING NYMPH.EA ODORATA (Elm).—The tank is much too shallow, it being necessary that there be 4 to 6 inches of strong loam placed at the bottom for the Lily to be planted in, which it may by turning it out of the pot and making the soil firm around the ball. The tank should be filled with soft or pond water, allowing a depth of water of 12 to 15 inches over the soil. Though being of moderate growth it will do in a less depth of water provided there be room laterally to admit of the leaves floating. Running water is not necessary, it being sufficient if the water be replenished as necessary with rain or pond water poured through a rose watering pot so as resemble rain. The conservatory would be more suitable than a warm greenhouse.

CUCUMBERS INFESTED WITH APHIDES (T,H).—When aphides obtain a hold it is difficult to effect a riddance except by repeated funigations, doing so two or three nights consecutively, and moderately so as not to injure the foliage, taking care to have the leaves dry, and to deliver the smoke as cool as possible. Syringing with tobacco juice, half a pint to a gallon of water, would also prove effectual, repeating if necessary. There is no preventive of insect attacks other than syringing and maintaining a sweet atmosphere, the attack being probably due to the prolonged sunless weather.

BEDDED GERANIUMS NOT FLOWERING (J. R. W.).—The gaslight shining on them is not the cause. The plants probably were not well ripened in growth, or the position is shaded.

POTATOES DECAYING (A.L.).—Excessive wet is the cause; and if the temperature increases to any great extent, and at the same time wet and dull weather prevails, the murrain will almost certainly make its appearance. We attribute its general absence hitherto to the low temperature of the month. We have seen some instances of the disease this year, but it is not nearly so virulent as we have known it in former years when the wet was accompanied by greater heat than has been recently registered.

BLIGHT ON APPLE TREES (Amateur).—If you refer to the American blight, which covers the branches in unsightly wool-like patches, dress the parts with paraffin with a painter's brush, not applying the oil to the foliage or to the smooth bark where there are no insects. Mildew may be destroyed by dusting the foliage with flowers of sulphur, just syringing the trees if needed so that the sulphur adheres to the leaves.

NEAPOLITAN VIOLETS (Idem) .- The plants grow freely if planted in REAPOLITAN VIOLETS (1dem),—The plants grow freely it planted in good soil and kept free from weeds and runners; but a south-west border is not the best position for them. A border facing east or north would be more suitable, being cooler. During their flowering period the plants are quite worthy of the protection of glass, as when thus protected the flowers are finer, cleaner, and sweeter than when they are exposed.

finer, cleaner, and sweeter than when they are exposed.

AERIAL ROOTS ON VINES (C.A.J.)—Allow the roots to remain until they shrivel naturally with the decay of the foliage. Their production has no doubt been accelerated by the coldness of the border—the sun, what little there has been, not being able to penetrate the manure which you placed on the border. We should remove a portion of it, pointing the remainder carefully in, not, however, touching the roots. You may again cover the border with manure in October, removing a portion of it about May, or sooner if the weather is mild. The Grapes should be thinned before they touch each other; indeed, they cannot be thinned too soon when it is seen the berries are fairly formed, and are swelling regularly and freely.

STRIKING ROSE CUTTINGS (Lady S. and Others.).—The present is an excellent time for inserting the cuttings, which should be made from wood that is becoming firm, such as the lower portions of the shoots that have produced blooms. The cuttings should be 6 or 7 inches in length, the leaves that is becoming firm, such as the lower portions of the shoots tuat nave produced blooms. The cuttings should be 6 or 7 inches in length, the leaves being cut from the lower portion, inserting the cuttings quite 4 inches deep in a rather shaded border. If the weather proves dry they should be sprinkled frequently, so as to maintain the foliage fresh as long as possible. They strike more readily in rather light than in heavy soil, but it is necessary that it be made firm around the cuttings. Nearly all kinds of Hybrid Perpetuals strike freely at this season, and Teas may be readily propagated now with the sid of a frame or handlights.

THE GREAT MULLEIN (R. S. Londonderry, and A. McK.).—This plant, Verbascum Thapsus, grows wild on dry ditch banks and on gravelly soil in various parts of the country. It is no doubt to be found in Ireland; at any rate, it has an Irish name, Cuineall Muire. Apply to a local botanist; or perhaps the Curator of the Dublin Botanic Gardens could supply you with the information you require.

PROPAGATING THE ELDER (T. G. S.). — Few trees or shrubs strike more readily than this. If you obtain some branches 2 to 3 feet in length early in the autumn, when the leaves are decaying, and plant them rather deeply and firmly where you desire the shelter, nearly all of them will emit roots freely, and will quickly form such a screen as you desire.

VEGETABLES FOR EXHIBITION (J. T. F.).—It is impossible for anyone to answer your question in the form which you desire. In making a selection of kinds the period of the year at which you wish to exhibit must be taken into account. For instance, if you desire to exhibit in July it is obvious that some of the vegetables you have named cannot be staged in good condition. The best advice we can give you is to read the reports of shows that have appeared from time to time in the Journal, and note the varieties with which such exhibitors as Messrs. Miles, Pragnel, Igguiden, and other good growers have secured their prizes at the different periods of the year.

SOWING CINEBARIA SEED (A Youngster).—It is not only not too late for sowing the seed, but it is probable that the plants raised from seed sown now will prove better than those raised two months previously. Mr. James of Isleworth, who grows and exhibits Cinerarias so well, seldom sows the seed before July. Sow at once thinly in very light rich soil, placing the seed pan in a cool moist frame, and keep the soil constantly moist. The seedlings will soon appear, and with good culture you will have fine flowering plants next suring. plants next spring.

EVERLASTING PRA (H. S.).—It is impossible for us to know whether there is a species or variety of Lathyrus in commerce other than the one you describe as having light "bright sky blue flowers." There are species

having blue flowers, and the one you refer to may or may not be one of them. Cannot you ascertain the origin of the plant, and thus determine for yourself whether it is a new or old variety? Without seeing a flower we cannot give a definite opinion on the merits of the plant.

GRAPES DECAYING (Lodge).—The fact that the Vines have produced 80 lbs. of Grapes on each rod 16 feet in length is conclusive evidence that they have been overcropped. The roots, too, have probably penetrated into ungenial soil that has caused decay of the fibres. You had better examine the roots, lifting them if necessary; or, if this is not requisite remove the surface soil from the border, just baring the roots, and cover them with a compost of turty loam, wood sahes, and crushed bones, so as to incite the production of surface roots. Remove more than half of the bunches, and the remainder may perhaps finish tolerably well. In the state in which the Vines appear to be one-third of your present crop will be ample. As the weather is so wet and cold fire heat with judicious ventilation is very advisable both for aiding the ripening of the Grapes and promoting the maturation of the wood.

maturation of the wood.

HEAVIEST BUNCH OF GRAPES (Amateur).—The heaviest bunch of Grapes we have seen, and so far as we know that has been officially recorded, was a bunch of the Calabrian Raisin weighing 26 lbs. 4 ozs. grown by Mr. Curror, gardener to J. Douglas, Esq., Eskbank, Dalkeith, and exhibited in Edinburgh on Sept. 18th, 1875. A bunch of Syrian grown by Mr. Dickson, gardener to J. Jardine, Esq., Arkleton, Langholm, weighed at the same show 25 lbs. 18 ozs. This appeared to be the larger bunch of the two, the berries having been more thinned than the former. Mr. Dickson has stated that the bunch when cut weighed 26 lbs. 8 ozs., so that either it must have lost weight before it reached the show or there was a difference in the scales employed in the two instances. This bunch is figured and Mr. Dickson's mode of culture described on page 297, No. 757, vol. xxix. of the Journal. Mr. Roberts, The Gardens, Charleville Forest, Tullamore, has grown a bunch of Gros Guillaume weighing 23 lbs. 5 ozs. Your second question, as put, cannot be answered.

VINE LEAVES YELLOW (Maseut).—As only the older leaves have termed

VINE LEAVES YELLOW (Mescat).—As only the older leaves have turned yellow, the foliage of the sub-internis being green and fresh, the cause is probably owing to the coldness of the border, the Vines not having made sufficient roots to support growth when the earlier leaves were expanding. The roots are more active now, hence the better condition of the more recently formed leaves. Permit as much of the healthy foliage to remain as possible, but especially guard against overcrowding.

VINE LEAVES DISCOLOURED (W. M.).—This discolouration is not uncommon in Barbarossa (Gros Guillaume), although it is not usual for it to be so marked thus early in the season. With a due amount of fire heat and judicious ventilation the wood and crop will probably ripen well and the Vine be in good condition for next year.

Vine be in good condition for next year.

CUTTING IVY (Persion Brig).—As the summer is wet and dull the Ivy if cut now will make fresh growth this year. You might, however, without much trouble leave a few of the long "ropes and tresses" uncut and secure them to the wall after the bulk of the growth has been cut away; you would then have a green surface at once. This is what we should do, for very possibly if you shave the wall closely you will find some bare spaces in consequence of the growth not having adhered to the wall. This is frequently the ease when Ivy has been long neglected.

PRARS CRACKING (Gardener).—Some varieties of Pears are more subject to cracking than others. It is the result of a check received by the fruit when in a young state, whereby the cuticle loses its elasticity. This check may be caused by dronght at the roots, or by a current of cold dry air striking the trees soon after the fruit had formed. There is no cure, and all the fruit like the specimen sent should at once be removed from the tree.

NITERATE OF SODA (W. E. Kay).—It can be had from dealers in agricultural manures, and has been advertised in our columns by Mr. Smyth, 10, Castle Street, Radell Street, Long Acre, London. From one-half to three-quarters of an ounce per square yard is a suitable application for kitohen garden crops.

Garden crops.

CUCUMBERS DISEASED (E. B. S., Bridgend).—The plants are infested with what is known as the Cucumber disease, which is clearly Illustrated and accurately described by Mr. Worthington G. Smith on page 34, No. 720, vol. xxviii, of the Journal. The parasites which cause the protuberances on the roots probably exist in the soil. We know of no cure, and you had better remove all the soil from the house, clean the pit thoroughly, and plant young plants in soil obtained from another source. Before destroying the plants, however, you might try the experiment of watering them with parafiln at the strength of about an onnee to a gallon of water, mixing thoroughly (which is not easy) with the sid of a syringe, and let us know the result.

CAMBER PILLIAB ON GROSERERRY RIGHES (W. D. M.).—The paternillar

CATERFILLARS ON GOOSEBERRY BUSHES (W. D. M.).—The caterpillar you have sent is the larvee of the Gooseberry Sawify, Tenthredo grossularies, and the female deposite her eggs close to the sides of the principal nervures on the under side of the leaves, which is very remarkable, for all the females of this extensive family are furnished with an instrument called the saw, for the purpose of outling into the leaves and stalks and introducing the eggs between the cuticles or under the bark. In about a week the larvee hatch, and commence feeding on the leaf on which they are stationed, and soon riddle them full of small holes; thus they go on feeding and changing their successive skinss as they increase in size, until they are three-fourths of an inch long, when they are seen scattered round the edges of a partly demonstated, holding by their fore legs, with their talls turned up, or lying on one side. Hand-picking is the most effective mode of riddance.

FUNGUS (R. L.).—It is the early stage of Phallus impudicus, or Stinkhorn.
INSECTS ON VINES (M. D.).—There are no thrips on the leaf sent, but
there is evidence of green fix being either on the Vines or on some other plants
near them. Funnicate the house moderately on two consecutive evenings,
and then give the Vines a thorough washing, directing the syringe between
the bunches and driving the water forcibly to the glass, so that it tails in
quantity on the upper surface of the leaves and cleanes them from all
impurities. The water which trickles down the bunches will do little or ne
harm moveled the surports of surpostry down.

impurities. The water which trickles down the bunches will do little or ne harm provided the syringing is properly done.

NAMES OF PLANTS (M. H. M.).—It is impossible to name the plant from such a totally withered spray. If you will send us a tiesh flowering specimen we will endeavour to supply you with the mane. (A. B.).—Your Rose is a somewhat rare one and very fragrant. Mr. William Paul, to whom we submitted the blooms, thinks it a variety of the Musk Rose named Princesse de Massau. We have no doubt that is the name of the Rose which we remember having seen many years ago in a garden in Berkshire. (W. Adams).—The scrap you have sent is quite unrecognisable. Send a better

flowering specimen when the plant attains a larger size. (E. Obeses).—
Hesmanthus coccineus, a very fine flower head. (J. G.).—Chrysmathesumm montanum. (J. H.).—1, Campanula glomerata; 2, Centaurea mossana; 3, Tradescantia virginica; 4, a garden variety of Potentilla atrosanguisea; 5, Geranium striatum; 6, G. sanguineum; 7, Centranthus ruber; 8, The specimen was insufficient for identification. (Pen and Int).—1, It appears to be Campanula grandis (the large Bellflower), but it is not easy to determine from such a small portion of the plant; 2, Lychnis chalcedonica (Soarkst Lychnis). (G. O. S.).—It is a dark-coloured variety of Lilium Entagon. The species is a native of Germany, and was introduced to this consisty in 1896. You are probably right in considering that the plant was first introduced into your district by the monks of Furness A bbey. (Hall).—5, Salgenduced into your district by the monks of Furness A bbey. (Hall).—5, Salgenduced into your district by the monks of Furness A bbey. (Hall).—5, Salgenduced into your district by the monks of Furness A bbey. (Hall).—5, Salgenduced into your district by the monks of Furness As abevas we can be considered to the continuous services of Colemass from leaves. The Begonia has no flowers: the leaf resembles that of B. Fransiana. The Achimenes is abstrates we consider the other resembles the small Rose do Meanux. (Wilkiam Mills).—1, it clusters is an an an achiment of the white Bose; the other resembles the small Rose do Meanux. (Wilkiam Mills).—1, it clusters is from the Marsh Pennywort, Hydrooxyle vulgaris; the Orchid specimen was not sufficient for identification;

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

CULTIVATION OF ITALIAN RYE GRASS.

THIS grass, so valuable for various purposes, it appears was first introduced, or brought into special notice at any rate, by Mr. Lawson of Edinburgh, who had paid great attention to its cultivation previous to his report published in the "Quarterly Journal of Agriculture" for January, 1832. In that year a gentleman whose farm adjoined our own purchased some seed at a guinea per bushel and by that means the grass was introduced into our neighbourhood and its early growth and productive qualities were so striking as compared with the ordinary sorts of rye grass that it attracted at that time much notice amongst the farmers of the district. This plant, Lolium italicum (Italian rye grass), is distinguished from the common rye grass (Lolium perenne) by larger and broader leaves, and also by its colour being a deeper green, and by the greater height to which it grows. It is often sown in the autumn, when not sown with other grasses in admixture, and in the mildest climates of the kingdom it certainly flourishes satisfactorily, and is also especially cultivated in different countries in Europe. It is also sown in the spring of the year either with or without a crop of corn. Having grown it for many years we always select the best sample and the cleanest we can obtain as foreign seed. We have found this to be necessary, seeing that by saving the seed in this country the grass loses after a little time its early habit of growth, and likewise its strength of blade and quick successional produce. It is often sown with clover, lucerne, &c., but its growth is so rapid that it completely overruns and quickly kills them.

Although this graes grows so early and so fast it is very hardy more so than the common sorts of rye grass, for in various districts abroad where the winters are severe the common varieties often perish, but not so with the Italian rye grass, for it stands the winter well even when sown in August and September. It is a perennial grass, too, and has been proved so by our own growth, but unless it is constantly dressed with the strongest and richest manures it will die away and the ground become naked at bottom. When, however, it is constantly manured with dressings rich in ammonia, such as the best Peruvian guano, nitrate of soda, or with rich liquid manure, the plant by continually tillering fills up vacancies so as to cover the ground with a thick meadow-like growth, which may be retained for a number of years. Our most noted growers that for many years past have depended upon liquid manures, chiefly for forcing on an early produce and quick succession, have been Mr. Huxtable in Dorsetshire, Mr. Dickinson in Hampshire, and Mr. Mechi in Essex, with some others. Whether it answers the purpose to use liquid manure, especially to a great extent, and carried to a considerable distance by force pump, pipes, and hose, is very doubtful, as compared with liberal applications of guano, nitrate of soda, &c. Italian rye grass answers a good purpose in the want of the land whereon it grows, being situated below the level of farmyards, as the crops can then be irrigated with the drainage from the farm buildings. If all the rain water be collected and concentrated to assist the flow of the drainage by

itsown gravity it will be attended not only with economy but with success, and in case a strong land spring of water is at hand and can be added, so much the better, because the drainage can then be more quickly and evenly distributed over a given area.

This grass has been found in numerous instances a

valuable adjunct in carrying out the system of house-feeding cattle, whether it is used for fatting purposes or for dairy cows. We consider there is no other grass food, unassisted by artificial food, which will enable cows to give so large a quantity of rich milk. Upon suitable soils a small area devoted to it, if abundantly manued, will yield more green fodder during the summer months tan can probably be obtained on a given space by any other fodder crep. Nitrogen may be considered as its favourite food, and if this be copiously supplied either by artificial or by liquid manure, it is known to be capable of growing an inch or more per day. In fact, upon our own farm we once measured an individual plant which after being cut down by the scythe had grown 34 inches in the succeeding twenty-four hours; this was on strong soil, with south aspect, without any special manuring. Five or six full average cuttings during the season are not uncommon when the land has been highly manured and the best foreign seed has been sown. It must, however, to yield such results be constantly supplied with stimulants; and to obtain the earliest and most abundant produce it should be grown upon a dry loamy soil, what is called good wheat and bean land, in a sheltered, mild, and moist

The late Mr. Dickinson published a pamphlet stating his experiments upon the growth of this grass at New Park Farm in the New Forest; he also stated that in favourable seasons a crop could be grown and cut of 12 tons per sere on the 1st of March, 12 tons on the 14th of April, 12 tons on the 14th of May, and 12 tons more on the 10th of June, 10 tons on the 10th of September, and another cutting after that of 6 tons per acre in the same season. After each mowing there must be applied a liberal dressing to produce

such extraordinary crops.

We will now state our experience in the growth of this grass. When we have sown the seed in the spring amongst the wheat or Lent corn it was merely sown on the land and harrowed in and then rolled. When we have sown it in the month of August or September on a fallow preparation we used about 6 pecks of seed. Some farmers sow 2 bushels per acre, but when it is sown too thickly it comes rather weak, and as this grass in its nature partakes of the cereals it must have room to grow strong for a full crop. Our plan of seeding is to prepare the land very fine, roll with ring roller, sow the seed with Bennett's hand machine, then give two tines with the chain harrow, and roll with the cylinder roller and leave it. We have sometimes grown it with broad and other varieties of clover for hay, but it grows very strong and coarse, does not make good hay for sheep, yet is good for horses and cattle; it, however, does not allow the clover to come well as a second crop, and where the land is intended to be sown with wheat out of less afterwards it robs the soil of the nutriment required for a corn crop, as it requires the same manures. We therefore cannot recommend its growth with clover of any sort, for it is sure to prejudice and dominate their produce. It is used very much in some counties upon the hill farms where there are no water meadows on account of its early growth, and the stock flocks of ewes and the young lambs in April do remarkably well when changed once a day from rye to rye grass. After being fed down the first time it shoots up again so quickly that it requires a heavy flock of sheep to keep down the growth, and about the first week in July the land is usually ploughed and pressed and drilled with turnips, and after feeding the turnips with sheep the land is then capable of yielding a good crop of Lent corn.

There is another way in which we have seen it grown with very remarkable results in the southern and south-western counties. Where the horned Dorset and Somerset ewes are kept, either for out of lea afterwards it robs the soil of the nutriment required for

Where the horned Dorset and Somerset ewes are kept, either for stock or for making the early lambs for the London market during January and February, there is nothing equal to this grass. Some of the best lambs we have ever seen killed at Christmas have been made by feeding both ewes and lambs upon it, and without receiving any cake or pulse as is customary when fed on Sweder, turnips, &c. The plan is to sow the grass in the wheat, and as soon as the wheat is cut it grows with astonishing rapidity, and the succession is so quick that in ordinary seasons we have known it folded off by sheep three times in the interval between harvest. and Christmas. The horned ewes when fed in this way will yield such an abundance of milk that they are enabled to maintain their twin lambs better than by any other mode of feeding; and when we consider that the horned ewes are celebrated for rearing a large number of lambs, the growth of this grass becomes a matter of more than usual importance.

WORK ON THE HOME FARM.

Horse Labour.—For several weeks this has been most seriously delayed in almost every district throughout the kingdom, on account of the prevalence of very heavy storms and dark cloudy weather, which prevents any drying of the land, even in the absence of rain. In almost every county the arrears of tillage in the preparing and seeding of turnips are very great, and the work

has now been so long deferred that a short acreage of mangold on the home farm has been sown. The same remark applies with still greater force to the drilling of Swedes, for on the mixed soils and heavy lands the ground during the month of June, nearly up to the time we are writing, would not bear the horses, much less allow of their doing tillage work on the fallows. In many districts not more than half the usual acreage has been drilled for the Swede crop, and much of what has been done was only effected at short intervals, and has left the land in very bad condition. Even upon the driest land of the hill districts nothing cution. Even upon the driest land of the hill districts nothing like the usual quantity of root seeds have been sown. The horse-hoeing, so essential for the benefit of root crops, has not been done; the hand-hoeing and singling of the plants have been so much delayed from adverse weather that in all directions the roots are hidden by grass and weeds, which when the weather changes for the better will cost as much as the crop will be worth to clean them. The fallows, too, for wheat and other crops are in the most dealorship state heims grass with weeds and a second the most deplorable state, being green with weeds, and also couch grass in many instances; and as the horse labour can do no good upon the fallows now work must be found for them, as it is positively injurious to the animals whilst eating green fodder to be out of work. They should therefore be employed in carting manure to the field where it is likely to be wanted, and in order to prevent too much fermentation it should not be cast up into the heap, but be drawn up, tipped, and levelled, so that the horses may draw each load upon it. This will tread it down closely and keep it without much waste or injury until required for use. Some horses may also, when not required for carting the hay or drilling for the turnip crop, be employed in carting earth from the roads and roadsides to heap, there to decay in readiness for future use, and if cast up with a roof-like top to the heap it will nearly always be dry enough for ordinary use. Earth, too, may be removed from all parts of the home farm roads and premises, where it will contribute to the neatness of the farmery; the roads leading from field to field should also be kept in shape—low at the outsides and highest in the middle. All these matters relating to farm practice will yield materials which if properly taken care of will pay for the labour, because done on certain occasions when the horses are not engaged in urgent and more important work. A large portion of the hay in the early districts has been seriously large portion of the hay in the early districts has been seriously damaged. We had a season like the present about seventeen years ago, only not so backward; but those who had patience and waited until after the 21st of July secured the hay very well.

Hand Labour.—This will be required in connection with all the work to which we have referred. The live stock of the farm during such an ungenial season as we have hitherto experienced will require year careful management, as neally all the most productive.

such an ungenial season as we have interest the most productive quire very careful management, as nearly all the most productive pastures are trodden very much with the heavy stock, and dairy cows particularly, where close feeding prevails, will require supplementary food, either of green fodder or oil cake. The weaned calves and yearling heifers should lie at night in a dry healthy paddock, and yearling heiters should he at night in a dry healthy paddock, although they may be fed at daytime upon low-lying meadows, otherwise they will often be attacked with "quarter ill," the most fatal disease known amongst horned cattle. Sheep likewise will now require dry ground for night folding, and if they have some cake or cracked beans so much the better, as they will then be better enabled to bear the low night temperature peculiar to the past three months. We have known farmers who this year have suffered serious losses, the ewes having died from being turned out in exposed situations immediately after being shorn. Many of the large flocks on the hills in various counties are found in very low condition by reason of the shortness of food in the spring, and are in consequence less able to bear the heavy rains and cold nights. The harvest seems likely to be very late—in fact, later than has occurred since the year 1816. In that year it is related by a reporter in the Agricultural Gazetts that a gentleman in Surrey recollects that they cut but very little wheat, even in the forward soils of the county of Surrey, before the 29th of September, and stacked none of any consequence before the 11th of October. We can safely say that this is the latest season we have known during the past fifty-three years, during the whole of which time we have been engaged in farming and harvest operations. We must therefore advise the home farmer to anticipate this state of affairs, and be ready to make the most of the of the large flocks on the hills in various counties are found in pate this state of affairs, and be ready to make the most of the time when harrest does arrive, and endeavour to have all kinds of work as forward as possible.

POULTRY AND COLUMBARIAN SOCIETIES.

COLUMBARIAN societies are of old date. They certainly existed COLUMBARIAN societies are of old date. They certainly existed in the last century, and many of their foremost and most enthesiastic members were men of consequence and distinction in the State as well as scientific breeders of fancy Pigeons. The formation of such societies always seems to have had a twofold object—viz., firstly, to encourage the interesting pastime of breeding curious and beautiful varieties and subvarieties of Pigeons up to particular standards of ideal beauty, and the comparison among the members of the result of their efforts; and secondly, to guard all such comparisons or competitions from all trickery and dishonourable conduct, and consequently to band together those of

kindred tastes in honourable brotherhood to the exclusion of all objectionable characters.

Of late there has been a great revival of such societies. First on Of late there has been a great revival of such societies. First on the list comes the National Peristeronic Society, which has its head quarters in London, and annually displays to the world, at its show held in January at the Crystal Palace, probably the most splendid collection of Pigeons ever possessed by one society. This Show is not a competitive one, and we observed in the inaugural address of its President for the year that he expressed a hope, that though by its rules the Scorety might hold corrective above. address of its Fresident for the year that he expressed a hope, that though by its rules the Society might hold competitive shows, it might not in fact ever do so. We thoroughly agree with Mr. Hedley, a Society so largely representative of the Pigeon fanciers of the kingdom certainly adopts a more dignified line in excluding the possibility of any dispute among its members as to the respective merits of their birds. Such a show, too, as that which it now holds gives possessors of birds with some exceptional beauty, but perhaps also some counterbalancing defect, an opportunity of exhibiting them, birds which at the ordinary competitive shows a judge would at once scratch off his list as unfit to be prize-

exhibiting them, dired which at the diffusion of prizeminers on account of the said fault.

There are many other provincial Columbarian Societies formed
chiefly on the same model, such as those of Liverpool, Birmingham,
Oxford, Manchester, that for the county of Surrey, &c. For the
most part these Societies do hold some competitive shows, though
the prizes are merely nominal. Few, if any, poultry societies have
hitherto been constituted quite on the same principles. We
believe in the palmy days of the Sebright Bantam mania there was
a club of fanciers of the breed. In later days Leghorns and other
particular breeds have been advanced by clubs of their admirers,
and there is a Poultry Club for the general good of fanciers. The
latter was established not so much for the promotion of more
exhibitions of poultry, as for regulating the method and spirit in
which its members should exhibit them and for protecting them
from swindlers, who seemed on the point of ruining their amusement and bringing all connected with it into discredit. All such
societies, if managed on strict principles honestly and fearlessly
carried out, do much good by elevating the pursuit of "fancying" carried out, do much good by elevating the pursuit of "fancying

poultry and Pigeons.

We fear that should these lines catch the eyes of some who we tear that should these lines caten the eyes of some who are little acquainted with the pursuit, or perhaps of those who are more interested in other departments of our Journal than the poultry yard and pigeon loft, that the use of the very word "elevate" may appear strange, if not out of place. "Could so domestic, so innocent an amusement," they would say, "require to be elevated?" Unfortunately it does. There is no use in concealing the fact, or in talking of an innocent amusement, when some who engage in it import into it much which is not innocent in itself, and which to outsiders appears simply disgraceful. We have occasionally found it our duty to expose abuses, and have done so fearlessly, but to all petty squabbles and vulgar personalities these columns have been closed. We wish the same could be said of all papers devoted to similar subjects. It is because a parentir which cheeld be said of the same and the same an pursuit which should be honourable, and which we wish to promote, has had and is having the greatest damage done to it by unprincipled people and reckless controversy that we write these lines. There has been and there is still going on a regular contest between upright fanciers in the true sense of the word and an objectionable class of people who, by trimming, cheating, overshowing, and other discreditable practices, try to make gain out of poultry or pigeon showing. We do not for a moment say that among exhibitors there are many such characters. We know dozens of fanciers who are as honourable people as can be found; nay, some of them at present advocate and practise the extremest scrupulosity as to every kind of embellishment of their birds for shows; but it is for this very reason, that there are so many upright ladies and gentlemen whose amusement is often spoilt by a few rogues, that we write strongly, and eagerly look out for any means of saving "the fancy" from the tender mercies of the latter class. of saving "the fancy" from the tender mercies of the latter class. At one time their energies seemed directed to plucking hocks and dyeing feathers; and thanks to the faint-heartedness of the committees of some shows, who ought to have had more courage, these practices were encouraged by the prize money being in some cases paid to the most notorious cheat whose trickeries had been exposed. This, however, was in a measure defeated by a prompt alliance of the bulk of honourable fanciers. Now the contest assens entering on a new phase and one not a casily to contest seems entering on a new phase, and one not so easily to

Disappointed exhibitors or their friends—the latter most frequently, under nams de plume, professing entire impartiality in the matter—have taken recklessly to impute any and every bind of have taken recklessly to impute any and every kind of dishonourable conduct to more scrupulous and more successful dishonourable conduct to more scrupinous and more successful rivals. Some of the best known fanciers have of late been thus attacked without a shadow of reason. We regret that unprincipled assailants often receive encouragement from journals which are barely kept alive by sensation. The result is, that we hear fanciers on all sides inquiring how they are to be rid of such petty annoyances and controversies, and how they can get quit of a class of people to which they do not belong and with which they have nothing in common.

Our suggestion would certainly be to form societies among

themselves for comparison of their birds, and to withdraw from the ordinary public exhibitions. We hear that already many members of the Poultry Club are urging upon the Committee the desirability of holding a poultry show open to members only and with only honorary prizes. The idea strikes us as a good one; and if we mistake not, the lovers of poultry and Pigeons will ere long be reduced to hold their contests in this way unless they can devise some effectual means of protecting themselves against the rowdy class of exhibitors, who are now to a great extent suprowdy class of exhibitors, who are now to a great extent supported by the subscriptions which more worthy people give towards shows under the idea that they are promoting the improvement of the breeds of poultry. Money seems to be the root of this evil as well as of many others; and we believe that the majority of genuine fanciers would be quite content with the honour of prize cards and rosettes. A few special and more tangible prizes in the shape of cups might be awarded, as at present, to the best among several winners of first honours; but rewards in the shape of hard cash should be excluded. Some benefit would still accurate to the successful exhibitor from the inbenefit would still accrue to the successful exhibitor from the increased value of his prize stock, and this might well be considered to counterbalance the cost of carriage to and from the show. Such an attempt would of course be an experiment, but one which we should much like to see tried in a place where there would be a fair chance of the working expenses being covered by the money taken at the door. It certainly would tend to the elevation of the fancy, and we hope the Poultry Club or some other club of amateurs may ere long see its way to making it .- C.

HINTS FOR YOUNG AMATEURS .- No. 8. POUTERS .- Part 2.

NEXT I come, among the colours of Pouters not so highly cared for as high fancy birds, to Chequers. I grant at once that this is not nearly so beautiful a colour as Mealy. Chequer seems to be the natural and general colour of common dovehouse Pigeons where there has been no mixture of fancy sorts, as in old manorial dovevery out-of-the-way they must be now-a-days for no half-bred fancy birds to have got among their stock.

In this respect there is now a great difference both as regards poultry and Pigeons. Twenty years ago the fowls about farm houses were of the commonest kind, very gaunt interbred bad birds; or if any selection had been attempted it was in favour of Dorkings, the farmer's favourite being the Speckled Dorking. But now all is changed. In driving about the country, or when staying in different country, or when staying in different counties, I always notice the poultry, and if they be not strictly fancy breeds you see there has been an admixture. The size of the cocks marks Brahma blood, as also their gait; then half-bred Hamburghs abound everywhere. Here you see fair Spanish, there you see half-bred Game, and so on. So also with the Pigeons sunning themselves on roofs or flying around barns and stables. The various colours mark the admixture—half Tumblers and half-bred Dragoons, both very prolific sorts, are very general indeed. This admixture as to Pigeons is a sideway proof of the advance of the fancy, but has been a sort of injury to the old dovehouse breed, which was select, and in its line beautiful; whereas half or quarter Fantails and other half breeds are not beautiful.

But go back a few years, and at all farms there were dovehouse Pigeons of a pure type, and these were Chequer, a kind of slate colour of two shades darker and lighter, which gave the bird a sort of chequer-pattern-looking plumage. There are now among Antwerp Pigeons Red-chequer as well as Blue-chequer; but were of this blue chequer colour, now and then they threw the were of this blue chequer colour, now and then they threw the bright pretty blue with black bars, such as we see at shows in perfection in Pouters, and particularly Dragoons. The two colours are clearly allied. Then I have bred when a boy blue Pouters from Chequers, and the reverse. The Chequers are cheap, and so fit for the young amateur, and he may sometimes breed good Blues from them provided there be good blood in them. They, as a rule, are somewhat thick in girth, which is a fault, but they often have very large goods. have very large crops. A cock Chequer and hen Blue look very pretty. I remember a small tradesman who had such a pair, and kept them in a warehouse in which he frequently came; the hen particularly was tame to sauciness, and would perch on her master's arm or shoulder, soliciting a caress like a cat.

master's arm or shoulder, soliciting a caress like a cat.

In addition to Mealies and Chequers there are white birds with splashed plumage, here and there dark feathers, these the result of whites being crossed with other colours in order to improve their crops, for white Pouters have slenderness and grace naturally, but often lack size of crop. These mismarked birds are cheap, and simply as Pouter Pigeons are among the best. I have seen splendidly shaped birds so coloured; now and then only one feather, or three or four of the wrong colour. I knew a fancier who had such a bird with one feather dark, all the rest white. I need not say that the dark feather was absent at shows: need not say that the dark feather was absent at shows

There are inferior Mealies, called in Scotland Sandies—part mealy, part red. At the Crystal Palace Show for more than one season appeared a magnificent dun-coloured Pouter, to which no

judge could possibly refuse a prize if there was a class suitable puage could possibly refuse a prize it there was a class suitable for him to appear in. There are also, as to colours, what I have called "the weeds of the loft"—i.e., small undersized birds, but not seldom of exquisite colour. These may be bought and crossed with some large Mealy or Chequer or splashed birds.

Next a few general remarks as to the management of Pouters.

Remember no high-up ordinary box outside a house is suitable for

them. They would have to stoop to get in and out, and soon be spoiled as to form. Then they would grow very wild and fear the approach of man, and not show off their beauty. Some place on the ground floor is best for them—some outhouse or place built on purpose, so that being on the ground floor the owner can walk amongst them and pet them more readily. Good-sized tea chests with or without bars in front make good boxes for them. They should be 20 inches at least in height, and 2 feet square. They may be bigger with advantage, and partly divided so as to form two nesting places, and to keep the half-grown young birds from getting on the eggs with the old bird, and so teasing her and

spoiling the eggs.

Pouters are well known as being bad nurses of their young, which as a rule have after the first fortnight to be brought up by other Pigeons or by hand. If a fancier has room and keeps a number of frigions of by hand. It a fancier has foom and keeps a number of strong Antwerps or Dragoons or half-bred Runts, and can transfer his Pouter eggs to those birds who have laid at the same time, all trouble is of course over. The nurses will not know the difference. Changing the birds often does not answer; but if, as difference. Changing the birds often does not answer; but it, as is usually the case, a young fancier keeps Pouters only he can raise the young by hand when their parents begin to neglect them, feeding them on beans soaked in water, a little warm water being added at feeding time to make the beans just as warm as they would be if ejected from Pigeons' crops. Nurses kept with Pouters do, to my mind, quite spoil the appearance of the loft. Children soon learn to be very expert feeders of Pouters, their little lissom fingers being very suited to hold the beak and beans. After a little practice a fancier can feed his young stock very rapidly, being guided as to quantity by the fullness of the crop.

There is this great advantage of bringing up Pouters by hand, that they become tame from the first. There should be kept

near them some small-sized food in a shallow box or tray, which

near they occome tame from the first. Inere should be kept near them some small-sized food in a shallow box or tray, which they will learn to pick at when hungry, and so become early feeders of themselves. They are apt to become very lazy in this respect, and run open-winged to their feeder when they are old enough to feed themselves; however, they must never be starved, or they will become stunted in their growth. After feeding them dip their beaks in water, and they will soon learn to drink.

Lastly, I would say that no Pigeons give more pleasure than Pouters, they are so conceited, grotesque, and funny; also they are noble-looking birds, and quite different to all other Pigeons. All fanciers who have ever kept them have a tender place in their hearts towards them for life. If they can occasionally be let out to fly it is well, and they look so noble on the roof of a building or strutting about a courtyard. They walk into the kitchen for crumbs in the most confiding manner. If their owners keep a cat it must be broken-in not to touch the Pigeons. I have had cats which have walked among them and the birds not the least alarmed, and the cat never thought of killing them; the secret was they were brought up as kittens with them, and never therefore regarded them in the light of food. For the sedentary and stay-athone fancier there are no Pigeons to be compared to Pouters. They become intimate pets, and almost friends. A room in a house with a wired enclosure for air and expresse suits them. They become intimate pets, and almost friends. A room in a house with a wired enclosure for air and exercise suits them admirably. We are told that some of the poor prisoners in the Bastile kept Pigeons; they must have been, I should think, Ponters.—WILTSHIRE RECTOR.

VARIETIES.

MESSHS. E. WEBB & SONS' Museum of Seeds, Roots, Grasses, &c., at the Shrewsbury Meeting of the Shropshire and West Midland Agricultural Society was, we are informed, one of the greatest features of the Show yard, being entirely new, of great length, and beautifully fitted up. Roots of immense size were shown in excellent condition, having kept perfectly sound throughout the past severe winter, proving the great value of the strains. The representations of flowers, grasses, &c., upon the pilasters at the front of the stand were very fine, and the same may be said of a beautiful large drawing in water colours, which gives a view in perspective of Messrs. Webb's extensive seed farms at Kinver, which are between eleven and twelve hundred acres in extent. Excellent specimens of the true Prickly Comfrey were exhibited, Excellent specimens of the true Prickly Comfrey were exhibited, and Mangolds, Swedes, and Turnips, &c., as growing for seed, also an extensive and admirable display of Grasses and Clovers in an extensive and admirable display of Grasses and Clovers in growth. The specimens in grain and straw were superior, and vegetables excellent. The display of annuals and other flowers in bloom was a great attraction. Samples of grass, farm, vegetable, and flower seeds in upwards of a thousand bags were exhibited. There was also a rich display of silver cups, which with other prizes value upwards of £500, are presented by Messrs. Webb & Sons for competition at their great Root Show at Curzon Hall, Birmingham, in November next and at the principal meetings

of the year. Upwards of 25,000 specimens were exhibited on the stand, representing the produce of the various specialities in farm and garden culture as identified with the name of this eminent

In addition to the silver medal awarded by the Royal Agricultural Society to Messrs. James Carter & Co., as recorded on page 38, we learn that similar awards have been granted to Messrs. W. Paul & Son, Waltham Cross; Messrs. G. Paul & Son, Cheshunt; Messrs. W. Cutbush & Son, Highgate; and Messrs. Little & Ballantyne, Carlisle; in consideration of their services in decorating the embankment projecting into the exhibition grounds at the late Kilburn Show

- WE have received the prize list of the Hemel Hempstead Poultry and Pigeon Show. October 1st and 2nd. together with the rules and regulations for the incubator tournament, the chief prize being a gold medal, value ten guineas. Entries for the Poultry Show close on September 13th, and for the incubator contest on August 23rd. Rules, &c., can be obtained from the Rev. Herbert R. Peel, Abbot's Hill, Hemel Hempstead.

— THE first annual Exhibition of the Surrey Bee-keepers' Association was held at Guildford on the 17th inst. Owing to the bad season there was not a large display, but the company was numerous. The first prize for the best hive of honey was taken by Mr. William Heathern, of Godalming. Prizes for the best and most economical hive were taken as follows:—First, Mr. Herbert Figgie. Bredc, Sussex; second, Mr. J. Lee, Bagshot Surrey; third, Mr. S. J. Baldwin, Norwood, Surrey. There was a large and varied exhibition of the appliances used in apiculture, and some capital models of hives in full work.

— THE Maidstone Journal says, "The broods of young par-tridges have suffered fearfully by the excess of rain in Surrey and triages have surered rearrilly by the excess of rain in Surrey and Kent, and hundreds of young birds have been picked up dead from disease caused by the wet. Young wild rabbits are also found dead outside the woods and plantations. At present the game season does not augur well for sportsmen."

- MUCH damage has been done in various districts by the storm of wind and rain which prevailed during Saturday, Sunday, and Monday. In Staffordshire several trees were blown down, and many acres of meadow land were submerged, and hay is rotting and many acres of meadow land were submerged, and hay is rotting in the fields. In the neighbourhood of Bath the gale was very violent, and fruit trees, corn, and hay crops, and horticultural produce received much injury. In Oxfordshire the floods have been very high for the time of year, and great damage is done to the crops, especially to barley, which is a complete failure on the heavy lands. At Portadown, Ireland, the rain fell in torrents, and maintained a downpour of such volume that within twenty-four hours thousands of acres of wheat, corn protatoes and hay four hours thousands of acres of wheat, corn, potatoes, and hay were submerged. From many other, indeed most districts, we have gloomy tidings relative to the fodder crops particularly and farming prospects generally.

THE HOPS IN KENT.—Under most favourable circumstances the hop crop cannot now prove satisfactory. Cold nights, wet days, and high winds, superadded to a serious attack of verwet days, and high winus, supernauce to a section min, have well nigh crushed the hopes of the Kent planters. The crus prospects daily become worse and worse. The foliage is assuming a sickly yellow appearance, the leaves are now covered with insects, and the plant is injured with wet and cold. The grapes, Jones's and inferior goldings, are in a particularly critical state. From all parts of Kent comes the cry for hot weather, and if we do not have it soon the crop failure will be more disastrous than it has been for many years.

— MR. W. A. GIBBS, Gilwell Park, Chingwood, writing on saving hay in wet weather, states that he lent one of his hay dryers to Mr. Ashcombe, a practical farmer. He started it at 9 A.M., and in ten hours had dried and stacked the produce of ten acres, estimated at one and a half load per acre. This was unripe, rank, weedy grass, which had been mown about twelve days, and left on the swathe quite untouched. The hay dryer was wholly uncovered and heavy showers fell at frequent intervals upon the hay as it was brought in from the field, and whilst it was being nay as it was brought in from the field, and whilst it was being dried. The cost of saving this hay is as follows:—Engine and man as hired, £1 5s.; hay dryer and stoker, ditto, £1 10s.; coal for engine, 6 cwt. at 1s., 6s.: coke for dryer, 22 cwt. at 1s., £1 2s.; two men to feed and one to take away, at 3s. 6d., 10s. 6d.; extra man in field to pitch, 3s. 6d.; extra man in field reloading, 3s. 6d.; extra carting, 1s. per acre, 10s.; total £5 10s. 6d. 110s. for 10 acres; 11s. per acre.

BRITISH BEE-KEEPERS' ASSOCIATION'S ANNUAL EXHIBITION AT SOUTH KENSINGTON.

THE fifth Exhibition of this active Association, although the THE fifth Exhibition of this active Association, although the summer (?) has at present been so terribly unfavourable to the interests of the bee-keeper, is fully as varied and extensive as any that have preceded it, although the honey classes contain but few entries and fewer exhibits. The driving competition in the bee tent on Tuesday presented a novelty in the appearance of the Editor of the Alsatian Bee Journal, M. Demaler. He operated much as did his English confrères, but supported the edge of the inverted skep by his forehead. He did not come into the prize list, as, sin-gularly, his queen refused to rise. After all the bees had left she guiarry, his queen refused to rise. After all the bees had left she was found held captive by a wandering bee from one of the hives previously operated upon, which had clasped her body and so severely stung her, that, as she was torn off, the terrible though little dart was left behind in the body of the poor queen. The winner was Mr. J. Walton, who caught his queen in three and three-quarter minutes from the moment of leaving to fetch his skep, and finished the operation in six minutes forty seconds.

Mr. Abbott, jun., stood second (seven and a half minutes), and

Mr. S. Baldwin third.

The observatory hives (ten entries) contain some notable novel-ties. Mr. C. Abbott first; Mr. Freeman, with a hive already de-scribed in these columns, second; and Mr. C. T. Abbott third with a hive carrying a new and very good form of hinge. An extra prize was awarded to, but declined by, Mr. Cheshire for a new kind of observatory. The prize was declined on the ground that the hive was not staged at the time the rules required. Mr. Lyon shows a hive in which an effort is made to remove the glass at the time the combs are closed together, so that in fact the colony forms an observatory and a stock hive by turns. The idea is excellent, but

it is very faulty in details.

In frame hives Mr. J. M. Hooker's, the second of Kilburn, stands first. This capital hive has been described in a late issue, and as first. This capital hive has been described in a late issue, and as a more detailed account with an illustration of it will presently be given in these columns it may now be dismissed. Mr. Abbott, placed second, does not again show the bottle for hot water. The hive is large and complex, and its crate containing some excellent sections is far from convenient. Mr. Baldwin is third with a very neatly arranged twin hive, in which the side entrance with a very neatly arranged twin into, in which a very neat from the second stock is well managed, and can by a very neat reversion of a block be immediately obliterated. The Philareversion of a block be immediately obliterated. The Phila-delphia hive of Mr. Neighbour is highly commended. Most of the exhibits in this class bristle with the zinc queen-excluder. The use of this perforated metal is not without its disadvantages. The use of this perforated metal is not without its disadvantages. Making the body of the hive large enough and giving the queen there enough to do will generally save supers from suffering from her intrusion, even if they be placed immediately over the frames. An analysis of the remaining classes will be given in the next issue.

FEEDING BEES NECESSARY.

COMPLAINTS reach us from many places that "bees are not doing," that "hives are full of drones and gathering no honey," that "swarms are not building combs fast," that "brood is fast disappearing from the combs," that "white drones are being cast out and old black ones are being killed." All these things in such a season as the present one are the natural results of felt or anticipated starvation. They often happen when bees are insufficiently fed. It is difficult to convey a correct idea of the amount of food necessary to keen a strong hive in full action or sufficiently fed. It is difficult to convey a correct idea of the amount of food necessary to keep a strong hive in full action or prosperity in the months of June and July. Hives without stores then require much artificial feeding in rainy or cold weather. "How much?" is a question of great importance in apiculture. Many bee-keepers this year have been hoping against hope for the weather to take a favourable change, and have not fed their bees continuously up to the prosperous point. The other evening I met one of the active apiarians of this place, who told me that "it took half his wages to keep his swarms alive just now, and that each swarm required 2 lbs. of sugar a week to save it from wasting and death." This, be it remembered, is not keeping swarms up to the prosperous point solely by artificial feeding, it simply keeps 30,000 bees alive. Swarms in a thriving condition build combs rapidly and fill them with brood. How much honey or syrup is required by bees to enable them to secrete wax enough to fill an ordinary sized hive with combs? This question cannot to fill an ordinary sized hive with combs? This question cannot to mil an oramary sized live with comos? Inis question cannot be answered accurately, for in warm weather comb-building goes on much faster than in cold weather. Liebig says that it takes 20 lbs. of honey to produce 1 lb, of wax. This may be an overestimate; but if we reckon that every good full hive has 2 lbs. of wax in it, which cannot be obtained or secreted from less than wal in it, which cannot be obtained or secreted from less than 30 lbs, of honey or syrup, we shall be able to make a good guess how much feeding is necessary to a swarm hive in full tilt of progress in such honeyless weather as we have had during the last six weeks.

There comes next for consideration the question of broodrearing, which is all-important, and cannot go on without a great consumption of food. Every cake of brood is valuable and heavy consumption of food. Every cake of brood is valuable and heavy—built up at considerable expense to the hive. In times of poverty or straitened circumstances bees wisely decline to set eggs and rear brood. They will not starve themselves and thus do evil that good may come. There are thousands of hives now (middle of July) in this country straitened for want of food—ceasing to breed and thus becoming weaker. In every case a great check is given to and loss sustained by a hive when it stops breeding from want of food. The pinch of poverty may not be really felt, but if anticipated or feared breeding is stopped.

The other day (10th of July) I saw seven hives standing in a

cottager's garden and I stepped in to see them. They had multiplied from two stocks this year—two natural swarms from each tiplied from two stocks this year—two natural swarms from each stock, and a large virgin swarm from one of the first swarms had just been hived that day. There I had before me seven strong hives of bees, capable of doing much work, from two stocks in a most unfavourable season. The owner of them, Mr. Jack, is a most capable and successful bee-keeper. He is an excellent feeder, and has at comparatively little expense increased his hives from three to seven, and in value from £4 to £10. In favourable seasons for honey-gathering artificial feeding of course is not necessary. In such seasons bees gather honey enough to build combs, rear brood, feed themselves, and store some away for future use, either for themselves or their owners. What for future use, either for themselves or their owners. What industry is necessary on the part of bees to supply their own daily wants, furnish their houses, and feed their young! And this industry never fails them. At this advanced time of the year, with hives without stores and combs nearly empty of brood, feeding must not be forgotten. If the weather become favourable bees may gather honey enough yet, and recommence to breat; but if the weather continue cold and unfavourable, we earnestly or transfer to commence at once to feed their bees constantly and vigorously with a view to get their hires full of brood, and thus have plenty of young bees in them before winter. In the absence of better weather this is the only thing that can save them from extinction. "Feeding or death" has been the cry of the last few months, and those who have attended to it have been their own best friends and best bee-keepers.—

A. Pettigrew, Carluke, Lanarkshire.

PROTECTION AGAINST THE STINGS OF BEES.—Mr. M. M. Balbridge, an American bee-keeper, advocates, where such an aid is needed, a bee veil for protecting the face and neck; and for the hands—in case the bees are inclined to sting them, which is not often—"the very best protection is to wash them with a weak solution of honey and water, and let it dry upon them. When thus treated the most irascible bees will seldom attempt to sting them. Gloves of any kind are a nuisance, and should never be worn by a live bee-keeper."

OUR LETTER BOX.

JERSEY AND ALDERNEY CATTLE (B.).—The Jersey and Alderney breeds of cattle have a strong resemblance, but not so the Guernsey, for they are a distinct breed and well maintained in all their purity up to the present time. We have kept both sorts for more than forty years, and we constantly see them as they arrive from the islands.

LINCOLNSHIRE BEE-KEEPERS' ASSOCIATION (A Render).—This Association will hold its fourth annual Exhibition of honey, bees, hives, and apiarian manipulations in connection with the Long Sutton Agricultural Society's Show at Long Sutton on September 17th and 18th. Entries close September 8th. Hon. Sec., R. R. Godfrey, Esq., Grantham.

HIVE UNSATISFACTORY (W. J. W).—The dull wet honeyless season is the cause of your bees casting out drones and brood. Read Mr. Pettigrew's article on feeding bees in the present number, and act in accordance with the suggestions contained therein. JERSEY AND ALDERNEY CATTLE (B.) .- The Jersey and Alderney breeds

16th.—Dark oppressive morning, fine afternoon; rain after 8 P.M.

17th.—Cloudy and very close heavy day, misty rain at 4.45 P.M.; fine evening. 18th.—Fair but dull morning; fine warm pleasant afternoon with sunshine;

Fair but dull morning; ane warm pressant attention with season fine calm evening.

Misty dull morning; at times dark and very stormy-looking; heavy rain at 1 P.M. for about an hour; damp dull afternoon and evening. Heavy rain during early morning, cessing at 8.30 A.M.; fair till 2 P.M., showery afterwards; strong gale 3 to 5 P.M.; wet evening. Gale of wind and rain during night; slight rain nearly the whole day

22nd.—Cool but much more pleasant day; slightly showery; fine evening.
Continued damp and cold, the entire characteristics of the weather being strictly autumnal.—G. J. SYMONS.

COVENT GARDEN MARKET .- JULY 23.

WE have now gone through the bulk of the Strawberry crop, all reaching us together, and considering the weather in very good condition. A general decline has been experienced in all classes of fruit, the demand having considerably fallen off the last day or two.

From observations taken near London during forty-three years, the average day temperature of the week is 74.9°; and its night mean approximation of the week is 74.9°; and its night mean three soles.

THE SUMMER PRUNING OF FRUIT TREES.

UCH has recently been published on the fruit prospects of the present year, and generally speaking the reports are extremely gloomy, almost the only exception being the jubilant tone of Mr. Peach not only informs us that his fruit crops are satisfactory, but, what is important, he states what he considers has been the cause of his success. Possibly there may be some who

or other enjoyed an unusual share of good fortune. He may possibly have had some local advantages which, however, he may not have perceived at the time, but still it is well to remember that good fortune generally

will think that your correspondent has in some way

follows good management.

Next in importance to the unfortunate failure of fruit crops this year—a failure that cannot be prevented—is the prospective failure of the crops next year unless special means are adopted to avert the calamity. I do not plead guilty of being either a croaker or an alarmist, but I hold it a matter of prudence to do all in my power to avoid a possible danger, and one of the dangers that I apprehend is a fruit failure in 1880, making the fourth if not the fifth in succession, which is a very serious matter. It is far better to anticipate failure and endeavour to prevent it than to wait until it arrives and grieve over it; hence I do not consider my note of alarm at all premature, nor is the call to action made a moment too soon.

If I am convinced of the soundness of one point of practice in gardening more than another this year, it is that of summer-pruning fruit trees. Much has been said, and will doubtless be said again, against the practice referred to, and probably instances may be cited which appear to establish its inutility; but at least an equal number of instances can

be adduced of quite an opposite tendency.

I am not an advocate of an extreme course of summer pinching and pruning of all trees and under all circumstances. I do not adopt the practice of crippling the growth of young trees, and consequently am unable to rejoice with Mr. Peach on the conspicuous precocity of his young threeyear-olds. One of my tenets is, that a fruit tree should be allowed to attain a size capable of maturing the fruit without any great strain on the tree's resources before it is encouraged to produce a crowded crop. I go further, and say that if it will then bear, as in some seasons it certainly will, without any great amount of pruning, I can very contentedly let it alone. In point of fact where trees bear freely the fruit restricts their exuberance, and what we seek to effect artificially is produced naturally, and a balance is maintained between foliage and fruit. But there has been no balance lately; fruit trees have lost their equilibrium, there have been no weights in one portion of the scale, and the growth has become excessive and essentially unfruitful in its nature. This is not only so, but matters are growing worse every day. Why do fruit trees grow so luxuriantly? It is simply a struggle of branch with branch and leaf with leaf in a determined effort to obtain light. It is in the

nature of a tree to bear fruit, but it cannot become fruitful without the action of light on its foliage. I advocate summer pruning now so as to admit light to the foliage, instead of the tree spending its strength and wasting year after year in struggling for the light which it must have to render it fruitful.

We have been told of trees that are seldom or never pruned which produce heavy crops of fruit, whilst others which are pruned both in summer and winter are barren. Old orchard trees for instance, are often pointed out laden with fruit, while younger trees that have been regularly pruned are fruitless. Granted; but how long have the veterans been growing? One thing is certain, they have in many instances grown until they have become comparatively exhausted and can grow no longer, and consequently the light exerts its beneficial influence on the foliage at the tips of the shoots, and fruit spurs form there and nowhere else. But it may be pointed out that younger trees that are not pruned are also fruitful. Yes, they may be when they stand singly in rows by the side of garden walks, and in that case they are actually less crowded than if they were pruned in winter, unless-and this is the real point of importance—they had attention also during their period of It is the old stereotyped practice of pruning severely in winter and not pruning in summer, that destroys the productiveness of fruit trees. It is further urged that the "market growers" of fruit who seldom prune their trees, but yet plant them closely so as to form "woods" or "plantations of fruit," invariably have heavy crops. Do they? My notion is that such cultivators as Mr. Dancer, whom we often read about, only have heavy crops in favourable years when the sky is bright and the sun hot. Are trees thus grown crowded with fruit this year? If they are I will admit my views on the subject are wrong; but if they are not, I have a right to claim that the theory advanced is sound. My evidence that it is so is the condition of a great number of fruit trees at the present time. Mr. Peach's trees that have been closely pruned in summer appear to be laden with fruit. I know of some others which have been treated in much the same way as those of your correspondent that are similarly productive this year. "But the pruning has not done it," I can imagine someone Well, if the summer pruning has not contributed to the fruitfulness of the trees in question I should like to know what has; and I further want to know why other trees in the same garden that have grown more naturally by having had little or no pruning, have also little or no fruit? Some old nearly exhausted orchard trees have some fruit on them-trees that have naturally produced short growths and few leaves, but more vigorous half-grown trees are fruitless.

The last summer was dull and wet, and so also was the summer of 1877, and the present season so far has been worse than either. Fruit trees are consequently, as a rule, excessively luxuriant and unduly crowded with wood and foliage. The leaves are large and filmsy, and the wood succulent. If such trees produce blossom, it is by no means certain that fruit will follow. When the wood of fruit trees is hard, containing a minimum of pith, the foliage is

NO. 1609.-VOL. LXIL, OLD SERIES.

NO. 267-VOL XXXVII, NEW SERIES

generally somewhat small but stout in texture, and the blossom | other plants, or to attempt their cultivation under the shade appears to partake somewhat of the nature of the tree and is hard too. At any rate it appears to resist the effects of a brush off inclement weather better than that produced by crowded and exuberant trees. What is wanted to produce healthy fruit spurs and well-developed blossom is well-developed foliage around the spurs and at the base of the shoots. It is on that foliage that the sun must shine or light act. Light, wholesome, life-giving, and fruit-producing light, has too long been obscured by the clouds floating between the trees and the sun; let us not make the obscurity greater by permitting a crowd of foliage to obstruct its rays from the parts that can so well and so profitably utilise them.

There are thousands of so-called pyramid and bush fruit trees at this moment into the centres of which the light can find no entrance, and leaves and spurs are in semi-darkness. If such trees produce fruit it is by chance and not by culture. The remedy for crowded trees and imperfect spurs and foliage is the knife and pruning shears, not applied in winter after injury has been done, but in summer—now, when it may be prevented. Neither is the mere shortening of the current year's growths in all cases sufficient. It is important to see year's growths in an cases summent. It was appropriate if what may be termed the main or permanent branches are not too numerous; if they are, remove them at once, for there cannot be a better time for performing the operation. This only applies to trees that have not been too long neglected, for if darkness has already done its work, and the branches are leafless and spurless, the mere admission of light will not cause other spurs to form on the naked branches, hence it is not usually advisable to interfere much with the growth of old trees that have seldom if ever been pruned. To younger and much valued trees of all kinds summer pruning may be done

with great advantage, but for the work to be in the highest degree effective it must be done promptly.

The main branches being sufficiently thinly disposed, the young growths should be at once shortened. If three or four good leaves are left at the base of each shoot they will be sufficient for this purpose; the terminal growths, if strong, also being shortened, but not nearly so close. In a few weeks after the general pruning other growths will have issued and must be removed with the finger and thumb before they become strong enough to need the knife. The work will thus be done expeditiously, and crowding will be averted. These remarks apply equally to trees on walls. Nothing but weeds contribute so much to the untidiness of a garden as neglected wall trees, and nothing contributes more to the barrenness of the trees than too long deferred or clumsily performed summer Of course such trees as Peaches and Nectarines, which produce fruit chiefly and young wood, must not be spurred as indicated; but even these trees may with advantage "Lay in the young wood of Peaches" is an axiom, but of equal importance is some such injunction as this—"Cut out the old wood to make room for it." Much growth can be spared from Peach trees now, and it can be removed with far greater advantage now than in the winter. Winter pruning is too ranch indulged in, and summer pruning proportionally neg-lected. Reverse the practice and head the trees, and better crops of fruit will follow; and, what is of especial importance this year, commence the change at once. Begin now, for wood that is made after this period is not only of no value in itself, but has the direct and immediate effect of impairing the fruitfulness of other portions of the tree which it deprives of the fruit-producing elements—air and light.—A NORTHERN " GARDENER.

THE CULTIVATION OF SHOW AND FANCY PELARGONIUMS.

ALTHOUGH these varieties are so popular, and although the best varieties are easily procurable from the nurseries at a very cheap rate, still they are not so well or so largely cultivated as they deserve to be, and I believe this is chiefly due to the want experienced by cultivators of suitable houses. The best strucexperienced by cultivators of suitable houses. tures that I am acquainted with for the cultivation of these plants are low span-roofed houses running north and south, ventilated freely at both sides and at the top, and so arranged that the plants can all stand near to the glass. In such a house with fairly good treatment the growth will be remarkably free, vigorous, and short-jointed, and the bloom eminently satisfactory. To attempt to cultivate them in houses where they are a considerable distance from the glass and crowded among

of Vines, fruit trees, or climbers, will only result in disappointment, as the growth will be weak and long-jointed, the plants unsightly, and the blooms, if any, small and few in number

In speaking of their cultivation I will first refer to propagation; and although the general practice both in the nurseries and in private establishments is to insert the cuttings and propagate the stock required when the plants are cut down after blooming, that is not the best time for propagation if vigorous specimen plants are required. I think the chief reason why autumn propagation has become so general is that cuttings are then much more readily procurable. I have found that the best time is in April or in May, when the plants are making vigorous growth. Cuttings taken then and placed in a moderate bottom heat will quickly root and grow more strongly, and they will ultimately make more handsome specimens than those struck in the autumn.

As soon as the cuttings are well rooted they should be notted singly in small pots in a compost of two parts good turfy loam added to one part of well-decomposed manure (that from spent Mushroom beds I find very suitable), a little leaf mould, and some good sharp sand. In all future repottings I use the same compost, omitting the leaf mould. The pots should then be placed upon a shelf close to the glass in a moderately warm temperature. The plants must have regular attention in watering, and be sprinkled overhead with the syringe once a day. As soon as the pots become nearly filled with roots the plants must be shifted into pots two sizes larger, and all blooms must be picked off as soon as they appear. The plants should be stopped when they are from 4 to 5 inches in height, and when the side shoots have attained a similar length they should again be stopped. About the middle of June the plants should be placed in a cold frame, where they may remain through the summer, receiving regular attention in watering, stopping, and tying out the side shoots, which are very likely to break off in training.

If the plants are growing freely they will require a second shift during the summer into pots 2 inches larger, but care should be taken to have the pots well filled with roots before winter. During the winter the plants should occupy a cool, airy, and light house. They should be kept moderately dry at the roots, but not allowed to become dust dry. Soon after the middle of February they may receive their final potting, and then place them in a temperature of about 50°, ranging to 60° with sun heat. Here they will grow freely, and as soon as the roots reach the sides of the pots weak liquid manure should be supplied at least twice a week. Towards the middle of March the shoots should be stopped for the last time previous to blooming. If growth is vigorous a sprinkle overhead with the syringe early in the morning will encourage healthy growth. I would not advise syringing them in the evening, as if the water remains long upon the foliage it is apt to produce "spot" and destroy many of their best leaves. Care must be

taken to keep the plants near the glass, not too crowded, and to ventilate freely whenever possible.

Attention must also be paid to fumigating as soon as aphides appear. It is a good plan to fumigate twice in the evening, and again early the following morning as soon as the first blooms commence opening. It is well known that to fumigate when the plants are in full bloom would cause all the blooms to fall that were then open. During the time the plants are in flower they should as far as possible be kept in a cool and moderately dry temperature. As soon as flowering is over they should be removed to an open position out of doors where they will ripen the wood previous to pruning them, which should be done in two or three weeks after placing them out if the wood appears ripe and firm. From the time they are put out of doors till growth has commenced water should be sparingly supplied, but a sprinkle overhead with the syringe each morning after

pruning will greatly assist them.

As soon as the young growth is fairly started turn the plants out of their pots, shake the soil from the roots, cut any long straggling roots back, and repot the plants in fresh compost, employing pots as small as can be conveniently used. Grewth employing pots as small as can be conveniently used. Grewin should then be encouraged, so as to have the pots well filled with roots previous to November, when the plants may be removed to their winter quarters and receive the same treatment as in the previous winter. In training the plants for exhibition purposes a low convex shape is most effective, and a ring of wire fastened to laths some 3 inches from the outside edge of the pot will be found most useful for training to. For conservatory decoration a more upright bush shape is generally 1 preferable, when the wire is better dispensed with.

In the cultivation of the fancy varieties nearly the same treatment is required as that I have attempted to describe for the large-flowering varieties, but for the production of fine specimens they are much better grafted upon one of the strong and free-growing large-flowering varieties. Many of the best varieties of Fancies are so tender in constitution as to be liable to suddenly die off at any time, but more especially during the winter months. This danger is very much obviated by grafting, as well as by that means securing a generally more vigorous growth. The best time for grafting is in the month of June; and for stocks, cuttings of strong growers struck the previous autumn and kept in large 60's or in 48's, should be selected and cut down to within 3 inches of the soil, and then be "whip" or side grafted. The scions should be selected from healthy and moderately firm shoots, and cut back to about 1 inch in length. When grafted the plants must be at once placed in a close frame, where they may remain till they commence growing. They will require shading from bright sunshine, and the inside of the frame must be occasionally sprinkled with the syringe. In pruning back Fancy varieties after they have done blooming the wood should not be as hard and ripe as in large-flowering varieties, or they will not break freely. It is best to do what pruning is required as soon as they come out of the house where they were flowering, and then stand them in a cold frame till they break, sprinkling them overhead daily with the syringe.

For flowering in the months of February, March, and April, free varieties from among the large-flowering section should be selected and cuttings taken not later than April. When rooted pot singly in 60's and place them in a cold frame. When the pots are full of roots repot the plants into 6-inch pots, in which they may be allowed to bloom the first season. Return the plants to the frame till the roots reach the sides of the pot again, when the plants may be placed upon a bed of coal ashes out of doors in the full sun. They should now receive liberal supplies of liquid manure, and growth must be cerve inceral supplies of inquid manufe, and growth must be encouraged as much as possible. About the middle of September they should be taken indoors and placed upon a shelf in a greenhouse near the glass; from then till Christmas water sparingly, and maintain a freely ventilated moderately dry atmosphere in the house. Early in the new year they should be removed into a warmer house, and again be placed upon a shelf near the glass where there is a temperature of 50° to 55°, there they will soon commence to grow and should be assisted with weak liquid manure. As they come into

bloom remove the plants to the conservatory.

After flowering they should be taken to a cold frame for a fortnight to harden them off gradually, when if the weather permits they may be placed out of doors in the sun and kept rather dry to ripen the wood; they may be then cut back and treated the same as advised for the later-flowering plants. Care must be taken not to overpot them, an 8-inch pot is quite large enough.

The following varieties I have found very suitable for early flowering:—Alma, Clothilde, Gauntlet, Dr. Andry, William Bull, Kingston Beauty, Leviathan, Triomphe de St. Mande, Mrs. Lewis Lloyd, and Desdemona.—W. K. WOODCOCK, Gardener to F. T. Mappin, Esq., Thornbury, Sheffield.

[Read at the Sheffield and Hallamshire Gardeners' Society's Meeting.]

STRAWBERRIES.

Our of fifty varieties of Strawberries on trial in the Experimental Garden this season on a piece of strong Strawberry land, it may interest your readers to know that of the older varieties Sir Joseph Paxton has, taking all circumstances into consideration, attained, or rather maintained, the position of pre-eminence; it has set quite as well or better than all others, and the fruit is large, firm, and of good flavour. Keens' Seedling and Vicomtesse Hericart de Thury both set and fruited freely, but the former has neither the firmness nor flavour, and the latter has not the size of Sir Joseph Paxton. On the other hand, President set very badly. Amongst the newer varieties Helène Gloede has been very good, and is in all respects an excellent Strawberry, but later than Sir Joseph. President Delacour and Auguste Boisselot from Mr. Veitch, Foreman's Excelsior from Mr. Boothby of Louth, and Duncan (I think-an American variety), all frame well; and the great American, although not yet fully realising all that has been

said of it in size, is decidedly a first-class variety. It bears large, round, highly glazed scarlet fruit, with red flesh, and is luscious and full flavoured, borne on stout footstalks which hold the fruit well off the ground. Dr. Morère, a large variety much grown on the Continent, has also done well this dripping season.-T. LAXTON, Bedford,

TWELVE HARDY FLOWERS OF THE MONTH.

THOUGH not yet past their best, herbaceous borders now require constant attention in the way of trimming such plants as have flowered. This is often done in a rough and ready way by cutting them close to the ground; but as this tends to weaken the plants the better method is to trim off the flower stems, leaving any fresh foliage there may be, and withdrawing the stakes at the same time. Seed should also be gathered when ripe, and many plants are more easily propagated by sowing the seed now than by waiting till next spring. The

following twelve are good useful flowers:—

Malva moschata alba (the Musk-scented Mallow).—This is not commonly included in select lists of hardy herbaceousplants, yet it is very handsome and has a fine musky odour. The pink or rose-coloured form is a not uncommon native plant, and the one under consideration appears to be a garden variety. It grows from 2 to 3 feet in height, the leaves are dark green and much divided. The pure white flowers are a trifle less than 2 inches in diameter, and they are borne in terminal clusters. It is propagated by seed, which ripens freely. Like most of the Malvaceous plants its stems contain a strong but coarse fibre, and many experiments have been made to testa its commercial value.

Silene orientalis var. compacta (the Eastern Silene) .- A very ornamental species, bearing umbels 3 or 4 inches across of beautiful rose-coloured flowers. The leaves are opposite and of a light glaucous green, and the plant grows about a foot high. Being scarcely a true perennial, plants, especially in heavy soils, seldom live more than two or three years, but it produces seed very freely. There is a variety with flowers more fringed

and lighter in colour.

Spirea Aruncus (the Goat's-beard Spirea).—For growing singly in open places there are few herbaceous plants which present a more striking appearance than this, the foliage alonemaking it highly ornamental. In good deep soil it sometimes reaches a height of nearly 6 feet, forming at the same time a massive clump of drooping pinnated leaves. Its flowers are creamy white, small individually, but forming large compounds spikes. It forces moderately well in slight heat. A native of Siberia.

S. palmata.—Though not new it is only lately that this has become anything like a popular plant. Of less robust habit its never forms such a fine plant as the last, but its broad corymbs of crimson-purple flowers are very beautiful. The leaves, dark green in summer, become in autumn finely tinted with brown and yellow, and the upper part of the flower stems are dark. Like most of the Spireas it prefers a slightly shaded. somewhat moist situation and a rich open soil. Introduced

sometimes by root-cuttings.

Campanula pyramidalis (the Pyramidal Bellflower).—July.

is peculiarly the month of Campanulas, and from the number. of fine species now in bloom it is difficult to select one or two and say they are the best. This, however, deserves precedenceand say they are the user and, however, and the long period-both on account of its imposing appearance and the long period-dependent of the long period and the long period. during which it has been a favourite cultivated flower. It was probably the first exotic Bellflower ever grown in Britain. Gerarde, who published his "Herbal" in the end of the sixteenth century, knew and cultivated it, and it is not unlikely. that it was brought by him from Savoy, as he mentions having travelled through several continental countries. It was known by the name of the Chimney or Steeple Bellflower, the first of these names being derived, it is said, from the fact that plants of it grown in pots were placed before unused fireplaces during summer; the last from the stately steeple-like form of its magnificent spikes. As a border plant its flower stems vary in height from 3 to 6 feet according to the nature of the soil, and secondary stems are thrown out from these, forming a handsome pyramidal outline, the whole being covered with a profusion of blue bell-like flowers. The best plants are those raised from seed, but seedlings seldom bloom before the third season. Offshoots are produced somewhat sparingly in many soils, and the plants not unfrequently die off after flowering.

Grown in pots under glass it attains to a greater size in all its parts, and is more symmetrical in shape. There is a white variety, but it is not so suitable for border cultivation. A

native of Savoy and Central Europe.

C. carpatica (the Carpathian Bellflower).— Owing to its having been used as a bedding plant rather extensively a few years ago. this, in both its forms of blue and white, is well known. It reaches a maximum height of about 15 inches, and is a very profuse bloomer. The flowers are very large and open, and are borne in loose panicles on long footstalks. It is not particular as to soil, but it shows to best advantage on large reck beds. It is not well adapted for bedding, and is not often used as such now. Propagated readily either by division or seed.

Chelone barbata (the Bearded Chelone).—By botanists this is now accounted a Pentstemon, but as Chelone it has long been a favourite flower. It bears long lax racemes of bright scarlet flowers with white throats, the lower lip of the corolla being bearded with orange-yellow hairs. The flower stems grow 3 or 4 feet high, and being rather slender require early attention in staking. Very easily propagated by seed or division. Seed sown in early spring under glass will produce

plants to flower the same season. A native of Mexico.

Asphodelus luteus (the Golden Asphodel).—The Asphodels are a tribe of Lilyworts, though in some classifications they are made the type of a natural order. This species is one of the finest, and probably the one most frequently met with in gardens. It grows from 2 to 4 feet high, with long leafy stems surmounted by dense racemes of bright yellow flowers. It is a native of many of the countries bordering on the Mediterranean Sea, is found plentifully in Palestine, and seems to be the flower referred to by Pope in the lines-

By the streams that ever flow.
By the fragrant winds that blow
O'er the Elysian flowers;
By those happy souls that dwell
In yellow meads of Asphodel
Or amaranthine bowers."

There is a double-flowered variety, but it is not more ornamental than the single form. Propagated by division of the

thick fleshy roots.

Erigeron glabellus (the Smooth-leaved Fleabane).—A showy Aster-like plant, growing 18 inches or 2 feet high. The flowers are light blue with yellow discs, and the leaves are smooth, narrow, and clasp the stems. Propagated by seed and division. A native of North America.

E. purpureus (the Purplish Fleabane).—This is a rough-leaved species, with soft reddish-purple flowers. It grows rather taller

than the last, and propagates itself freely by seed, seedlings flowering the first season. Also a native of North America.

Rudbeckia Neumannii (Newman's Cone-flower). — This gigantic Composite, though somewhat coarse, is a very striking plant in a large border, growing as it does sometimes nearly 6 feet high. The leaves are rough, coarsely pinnate, and the flowers are large, 4 or 5 inches across, bright yellow with black conical discs, hence its name of the Cone-flower. Native of North America.

Tropæolum speciosum.-Though this is a climber and not usually grown among herbaceous plants, it is yet so beautiful that I cannot resist including it here. It has been in this country somewhat over thirty years, and is everywhere held to be one of the best hardy herbaceous climbers we have. When thoroughly established in congenial soil it reaches a height of sometimes nearly 20 feet. Its foliage much resembles that of the well-known greenhouse T. tricolorum, but is larger, and the flowers which are produced in thousands are a brilliant vermilion-scarlet. It is everybody's favourite, yet it is not everywhere that it succeeds. The essentials to its successful cultivation seem to be a deep rich soil moist but not wet, a wall with a south-westerly exposure, and perfect freedom from disturbance at the roots. That it thrives better in a humid climate is also attested by the fact that much of it is rarely met with on the east coast of Scotland, while in the west it is magnificent. Anywhere it requires two or three years after planting in which to establish itself before it will flower The flowers are succeeded by bright blue berries. R. D. TAYLOR, Knockdolian, Colmonell, N.B.

PEACHES AT THE RED ROSE VINERIES.

As these have previously been alluded to in your columns as all being Mr. Rivers' seedlings save Royal George, I regret that I have not drawn Mr. Ferguson's attention more particularly

to them. To very gross growth and no fire heat alone may be attributed the failure of some in setting their fruit; and though I regard Royal George as my testing standard, I ought also to remark that Magdala is my greatest success. Large Early Mignonne I am also much pleased with, and as I am now about to add fire heat I am not the least afraid of succeeding next spring with all the lot. As a good hardy variety for the north of England Early Alfred is worth notice, and Early Ascot has proved itself especially hardy. A few general notes I must reserve for less busy times.—J. WITHERSPOON.

CARNATIONS AND PICOTEES.—No. 7.

(Continued from page 2.)

CURRENT WORK.—In early situations the plants will now be fast approaching the flowering period; and if they are in good health the patient florist will soon reap his reward. Those who intend exhibiting ought to have some covering, such as a glass roof or tent, under which the plants may be placed whilst in bloom. If the situation is sheltered it will be well to let the ends and sides of the structure be open so as to cause a thorough circulation of air amongst the plants, which is necessary to prevent them from being drawn and consequently weakened in their young growth. Those who can afford it should have a house in which to flower the plants. This may be a skeleton frame, employing two 6-foot slides for forming a span roof: of course the length will just depend on the amount of slides used for the roof. A building of this width gives suffi-cient room for a full-sized stand of plants with a path, and three rows of pots down each side; on one side Carnations and on the other Picotees. My reasons for keeping the Camations and Picotees distinct from each other are two. One is that it appears incongruous to have the blooms of Carnations and Picotees mixed indiscriminately together; and the other is that there is always a risk of Carnations and Picotees being intercrossed, the result of which would be that the seed saved could produce nothing but mongrels.

Some varieties it is necessary to bloom on a card, otherwise the back petals in a full-grown bloom are liable to be curled; in which case it is nearly impossible to straighten them. Some of the worst are True Briton, s.B.; Marshal Ney, c.B.; Sarsh Payne, P. and P.B.; Squire Meynell, P.F.; Premier, P.F.; Illuminator, S.F., and Mary Ann, B.F. It will be found sufficient if the bloom is allowed to hang loosely with the card lying on the top of the back petals. It will greatly add to the enjoyment and pleasure of the grower if the whole of the flowers are carded, the plants being staged with the taller-growing varieties for the back rows, and the dwarf varieties in the front. If each bloom is carded and attached to the rod with a Carnation pin, and set in such a position as to meet the eye of the observer at a right angle when passing down the path, it will in my opinion be a great advantage. A Carnation pin is made of brass wire a little thicker than an ordinary pin; one end is pointed in a similar manner to the pin, the other forms a circle about an inch in diameter, which bears up the card and the bloom. The pointed end of the pins is pressed into the rods with a small pair of pliers, also at the same time giving it the angle suitable to meet the eye when standing in

the path.

All early blooms, if good, should be carefully hybridised, as the chances are much more in favour of getting a pod of wellripened seed from an early bloom. As an example, my earliest flower last year was John Delaforce, H.P.P.: just before it was too late I had a flower of Mrs. Summers opened. With this I hybridised the bloom of John Delaforce. The result was that I had upwards of forty seeds of the largest size, every one of which germinated. In no case had I any other pod so fine as the one mentioned, but then it was fully three weeks before I had any others on which I could operate. It will be well for the new beginner to practise dressing on the early blooms; for although there are some few people who object to it, yet I am so well satisfied with the improvement made in the flowers that I should be sorry indeed to see dressing done away with. In fact to growers in windy situations like mine it would frequently be an impossibility to exhibit non-dressed flowers fit to be seen. Until we raise varieties that do not require dressing, and as long as we grow the majority of flowers at present in cultivation, we shall be compelled to employ the dressing

I will endeavour as near as possible to describe the process of dressing; for although one practical lesson is worth all that can be written, yet still some little information can be gleaned

even from a written description. To commence, we will suppose that you have the dressing tools all ready as before described, the cards also, with the holes enlarged to the size before given, and having a number of soft paper collars made of any kind of paper sufficiently strong to bear up the cardboard collar. These soft collars should be 1½ to 2 inches in diameter, with a starred hole in the centre, and made so that the points of the star may bear or hold against the bottom of the pod without pressing on the pod so as to bear on the footstalks of the petals. All being ready, the first thing to do is with the steel tweezers to bend back the points of the calyx, splitting tight-podded varieties down somewhat, so as to give more play for laying out the petals; then with the ivory tweezers form the largest or ground petals into a circle, the next row diminishing, but placed alternately with the first row. Afterwards in full varieties another row of petals may be placed, leaving sufficient petals to form a crown, which petals should always be bright and good, as the dresser's art is to bring out or show the best coloured petals when forming the crown of the flower.
Full flowers should have a pyramidal appearance, whilst the thin flowers should be round with the petals slightly cupped. Some varieties will dress with a hole down the centre of the flower, as if a number of petals had been extracted. In this tower has been roughly dressed the card should be fixed and the finishing touches given. In all cases remove all self or run petals, or in Bizarres any which may be short of Flake or Bizarre, as it is a disqualification. In some flowers the stigmas are very strong and stiff and interfere with the dressing of the petals, in which case cut them off; also cut off the anthers of any variety which may carry the anthers in a cluster at the top of the flower. Always use the steel tweezers for extracting petals, and be careful in dressing the flowers not to split the

One or two pests will now begin to be troublesome amongst the plants, such as caterpillars and the Rose borer. The flowers, if the weather is dry, will in some situations be eaten by ear-wigs, which must be persistently hunted for and destroyed. A friend of mine who is sadly pestered with them has clean pipe heads placed on the tope of his rods, and they form good iraps.

Layering may now be commenced, layering only such plants as may be showing colour, so as to be certain that the flowers are in proper colour; those which may come run or selfs should be marked, so that if layered they can be kept separate from the others. The best compost I find for rooting the plants in when layered is turfy loam with a mixture of sand, if strong, and always a portion of burnt straw or powdered charcoal. To those who may be a distance from where pegs can be procured for pegging down the layers I can recommend a wire peg invented by Mr. Hartley of Leeds. Do not cart off the ends of the foliage, as is sometimes done. I always find the layers root quicker when the foliage is left in its natural state.

Plants in Beds .- Look out for vermin of all descriptions, particularly slugs and aphides, which destroy at once. Tie up the flower stems as they advance, and disbud the plants as soon as the buds are large enough; two buds to be left on weak growers, whilst three or four may remain on strong va-rieties. Give weak doses of liquid manure after the buds are formed, should the weather prove dry.

Scodlings .- Any which may have had the soil splashed into the foliage should be cleaned carefully. At the latter end of the month those who may intend growing them in the open may plant them out in the prepared beds, so as to insure their being well established before winter sets in.—G. RUDD.

CARROTS AND LETTUCES.

THE quickest, largest, and most shapely early Carrot with us is the Early Scarlet Horn; the next best is Early Nantes. These are sown broadcast amongst the Onions, and are cleared of the ground before the Onions require all the space. The latter are making a good growth this season; but unfortunately some of them are decaying, and the grabs of the Onion fly are likewise among them. However, as Onions are not thinned out there will be a sufficient number left for a crop unless the disease and grub prove more than usually destructive. The latter is very prevalent in gardens this season.

I can find no varieties of Lettuce to equal Hicks' Hardy

Cos and Neapolitan Cabbage for summer and autumn use. The

former I have in use throughout the year. In winter the plants are sheltered in frames, in early spring they are lifted from the open border and grown on in a late Peach house. This is also one of the best for standing the winter or coming on out of doors. I consider it the best Lettuce grown. R. P. BROTHERSTON.

BIRMINGHAM ROSE SHOW .- JULY 24TH AND 25TH.

AFTER the last Exhibition at Aston Park the Birmingham Rose AFTER the last Exhibition at Aston Park the Birmingham Rose Show which had merged in the Aston undertaking became defunct; but the manes of the departed glories of the Town Hall were not to be appeased, and, phœnix-like, the Show has taken a new and I trust a long lease of existence, and with its old moving spirits (amongst whom Mr. E. W. Badger being himself a host), has reappeared full of vigour in Bingley Hall, and its renewal all Rosegrowers will hail with delight. The Committee, acting upon the votes of those of the Rose community intending to take part in the Exhibition, wisely postponed the Show from the 17th inst. on account of the continued protracting effects of the weather and the proximity of the formidable gathering at Hereford, and full of hopes encouraged by the finer weather of last week and of of hopes encouraged by the finer weather of last week and of promise provoked by a very large number of entries, they naturally promise provoked by a very large number of entries, they naturally looked forward to a magnificent display; and bearing in mind the central position of Birmingham as the trysting point of north and south, their hopes were not unreasonable. But alas! something like sixty hours' rain between the previous Saturday and Tuesday completely shivered those expectations as well as the aspirations of scores of intending exhibitors. Notwithstanding the hostility of the elements at cutting time, a large and respectable show was, however, got together; and the exhibits from Hereford contributed not a little, it must be confessed, to this result, for without Hereford the Show would have been a floral disappointment. As it ford the Show would have been a floral disappointment. As it was spotted blooms were almost the rule, and the marvel is, In what manner does the magic soil of Herefordshire fortify and render less absorbent the petals, so as to enable the blooms to resist the perpetual moisture of 1879? for Messrs. Cranston's and Mr. Jowitt's flowers were comparatively clean to most others, but even these on some occasions would only have been second. Most of the large southern growers were present with a laudable and unselfish desire of furthering the revival of Birmingham; but it is questionable whether, if they had solely consulted their own interests, their boxes should not have been left at home. The north was hardly represented unless Nottinghamshire be included in that division; but neither Canon Hole's nor Mr. Frettingham's Roses from that county were fully developed, and it is evident that a Rose Show in August might meet with support. Mr. Prince, too, informed me that the Oxford Roses would not be at full for another fortnight.

The Show was held in the skating rink of Bingley Hall, which in very dull weather may have advantages in light and cheerfulness over the Town Hall, which on this occasion was not available; but fortunately Birmingham was for once in a way favoured with fine weather; and on Thursday, when staging was proceeding, it became evident that a material increase of light and temperature was quickly tending to open the eyes and fade the dresses of many floral beauties whose Siren-like education had so unfitted them for the direct rays of Phœbus. But the executive was equal to the occasion, for forti nihil difficile; and in a trice, was equal to the occasion, for forti nihit difficite; and in a trice, and before some public bodies would have carried on a preliminary discussion, Mr. Badger, with Mr. Vertegans as engineer, had extemporised a parody in whitewash of the all-familiar summer cloud, and almost before staging was completed the whole of the glass in the roof was externally whitened, the threatened danger being averted, and the colour and appearance of the blooms at once materially heightened and improved.

once materially heightened and improved.

In the class for seventy-two single trusses, open to nurserymen, the competition was principally between Measrs. Cranston, G. Paul & Son, and B. R. Cant; the former being first with plenty of colour, and including good blooms of Le Havre, Marie Rady, Annie Wood, Duchesse de Caylus, Annie Laxton, Avocat Duvivier, Gabriel Tournier, Marie Cointet, Pierre Notting, and Marquise de Castellane. Mr. B. R. Cant of Colchester was second; and Messrs. Paul & Son of the Old Nurseries, Cheshunt, third. The parties Castellane. Mr. B. R. Cant of Colchester was second; and Messrs. Paul & Son of the Old Nurseries, Cheshunt, third. The parties occupied also similar positions in the class for forty-eight varieties, three trusses, Mr. Cant was first. For the local prizes—open to nurserymen, residents of the counties of Warwick, Worcester, and Stafford—Messrs. Perkins & Son of the Park Nurseries, Coventry, showed very creditably indeed, and had they concentrated their strength in some of the open classes they might have been formidable competitors. They were first both for twenty-four and midable competitors. They were first both for twenty-four and twelve, single trusses, as well as for twelve varieties, three trusses.

In the amateurs' class for theiry-six varieties, single trusses. Mr. Jowitt of the Old Weir, Hereford, was first with fresh and bright flowers, his winning team consisting of Madame Charles Crapelet, Madame H. Jamain, Alfred Colomb, La France, Leopold I., Hippolyte Flandrin, Lord Herbert (good both in this and the succeeding class), Mdèle. Eugénie Verdier, Horace Vernet

Etienne Levet, Capitaine Christy, Dupuy-Jamain, Souvenir de la Reine d'Angleterre, Cant's Seedling No. 4 (promising), Baronne de Rothschild, Thomas Mills (very bright and clean), Marquise de Mortemart, Marie Rady, François Michelon, Sultan of Zanzibar, Comtesse de Serenye, Lord Macaulay, Star of Waltham, Marquise de Castellane, Madame Victor Verdier, Mons. E. Y. Teas, Beauty of Waltham, Pitord, Le Havre, Madame Nachury, Louis Van Houtte, Olivier Delhomme, Sir G. Wolseley, Dr. Andry, Duke of Wellington, and Exposition de Brie. In this class the Rev. Canon Hole of Caunton Manor, Newark, was second, his stand containing Madame Prosper Langier, Avocat Duvivier, Rtienne Levet, Duke of Edinburgh, and Annie Wood in good form. Mr. Jos. Davies of The Square, Wilton, was third. For the twenty-four varieties, single trusses, Mr. Jowitt was again first; J. H. Arkwright, Esq., of Hampton Court, Leominster, was second; and G. P. Hawtrey, Esq., Langley Place, Slough, third. Again for the twelve single trusses was Mr. Jowitt to the fore, Mr. Charles Davies of the Grammar School, Aynhoe, being a very good second, and the Rev. Canon Evans of Solihull third. In the local competitions for the counties of Warwick, Worcester, and Stafford, twenty-four varieties, Canon Evans was first, Mrs. Alston of Elmdon Hall second, and Mr. E. H. Fewkes of Birmingham third. For the twelve varieties Canon Evans was again first, Mr. Julius Sladden of Badsey, Evesham, second; and Mrs. Alston third. In the classes open to residents within four miles of Stephenson Place, Birmingham, the competition was restricted, Junt sum very respectable blooms were staged. Stephenson Place, Birmingham, the competition was restricted, but some very respectable blooms were staged.

In the open classes Messrs. G. Paul & Son were first for twelve new Roses not in commerce previous to 1876 with May Quennell (not so bright as I have seen it), Robert Marnock (rich velvety maroon), Marie Verdier, Magna Charta, Charles Darwin, Constantine Fretiakoff, A. K. Williams, Marquise de Murinais, Mdle. Gabrielle Luiset, John Bright, Madame Lambard, and Marie Laries. Bouthth most thing of Sabiah parameters allowed to the contract of Sabiah parameters. Gabrielle Luiset, John Bright, Madame Lambard, and Marie Louise Pernet, the most striking of which are noted elsewhere. Mr. Cant was second. For the best new Rose (six trusses) Mr. Cant was first with A. K. Williams, and Messrs. Paul & Son second with Robert Marnock. There was only a limited competition in the classes for Tea, Noisette, and China Roses, Mr. George Prince of Oxford being first for twelve varieties, Mr. Jowitt second, and the Rev. H. W. Watson, Berkswell Rectory, Coventry, third. The classes for twelve yellow, dark, rose-coloured, and white or blush Roses in four varieties, three trusses of each, were fairly contested, but the quality of the blooms, especially the light varieties, which were decidedly ragged, does not call for much comment. and the out the quality of the blooms, especially the light varieties, which were decidedly ragged, does not call for much comment, and the effect was unsatisfactory. Roses in pots were exhibited only in Class 26 (for thirty varieties) by Messrs. Paul & Son, and to whom the first prize was awarded. For the best bouquet for the hand entirely of Roses and Rose buds Messrs. Perkins were first, Messrs. Cranston second, and Mr. H. Frettingham of Beeston,

Notta, third.

Notts, third.

Amongst the Roses prominent at Birmingham for their powers of endurance and stability were those of the thick-petalled type represented by Etienne Levet, Marguerite Brassac, Le Havre, A. K. Williams, Horace Vernet, Duke of Edinburgh, Dupuy-Jamain, Sultan of Zanzibar, Dr. Andry, Beauty of Waltham, and Marie Finger. The following Roses also kept a well-marked position all through the Exhibition—viz., Thomas Mills (colour very bright and well maintained), Marie Rady and Mons. E. Y. Teas. Mr. Jowitt also showed excellent, indeed almost perfect, specimens of a Rosa rediviva in the shape of Lord Herbert, which was some years ago launched by Mr. G. Paul, but almost immediately in a very unparental manner, although no doubt conscientiously, very unparental manner, although no doubt conscientiously, abandoned by him.

Of the newer varieties Constantine Fretiakoff, somewhat in the way of Comtesse d'Oxford, but brighter and fuller, and not so con-Marguerite Brassac, sometimes undistinguishable from Charles Lefebvre, was admirably shown, and Mr. Jowitt's specimen which Lefebvre, was admirably shown, and Mr. Jowitt's specimen which was as near perfection as possible deservedly obtained for him the prize for the premier Rose in the Exhibition; it seems to me to be a fusion of Charles Lefebvre, Horace Vernet, and Fisher Holmes. A. K. Williams is another good dark Rose of substance, and if in size it carries all that is required it will have few equals. Jean Soupert is probably the best modern dark Rose, but perhaps the Sultan of Zanzibar would not admit it; both are very good. Avocat Duvivier was well shown in several stands, and in new Teas Madama Nabonnand of a distinct flesh tint approaching in Teas Madame Nabonnaud of a distinct flesh tint, approaching in colour La France, Anna Ollivier, and Comtesse Riza du Parc were also good. Comtesse Nadaillac and Marie Van Houtte were the best represented of the older varieties, Marechal Niel being almost conspicuous for his absence.

Decorative plants, which considerably enhanced the display, were contributed by Mr. R. H. Vertegans of Chad Valley Nurseries, Mr. Hewitt of Solihull, and Mr. Vice-President Tarks; and in the competition in Class 27 Mrs. Alston of Elmdon Hall was first with very fine specimens of stove and greenhouse plants, and Mr. C. E. Matthews of Edgbaston second. Messrs. W. Paul and Son of the Nurseries, Waltham Cross, sent six boxes of Roses not for competition, including some fine blooms of Duchess of Beddoxd (an improved Général Jacqueminot and of very fine form), May Quennell, Countess of Rosebery, and some promising unnamed seedlings. Mr. G. Davison of White Cross Nurseries, Hereford, also contributed some good blooms not for competition, and a stand of seedling Roses was exhibited by Mr. Arkwright. Messrs. Hewitt showed a stand of cut Delphiniums, consisting of seedlings and named sorts, amongst them some striking varieties. Mr. Edward Holmes of Withington Nurseries, Lichfield, had large baskets of Nertera depressa profusely berried, and (if edible) suggestive of jam for the Kentish fruit-growers. Mr. Holmes also showed a distinct and striking new Conifer—Juniperus virginiana alba spica—stated to be hardy.

giniana also spica—stated to be narry.

Fine weather also characterised the second day of the Show, and it is hoped that the unpropitious season will not bring such unsatisfactory results as to prevent a repetition of this pleasant gathering in 1880.—T. LAXTON, Bedford.

ORCHID CULTURE.

LATELY we were much struck, while inspecting several gardens where Orchids are particularly well grown, to find that at no two gardens or nurseries were these grown under exactly the same conditions. The underlying secret in the successful culture was the intelligent care evidently bestowed on the plants; for not only were the structures as different as could be in some instances, but the material employed and the mode of potting were very varied. This was particularly noticeable in the case of deciduous Calanthes. These were grown in flat pans suspended near the roof, in small pots, and in pots of a larger size. The soil also varied from a base of loam to one consisting of peat; some were in unmanured composts, others in composts rich in manure, yet where the care bestowed was evidently great the difference in the growth in the several instances was scarcely noticeable.

Odontoglossums furnish another case in point. They were found in robust health, flowering freely, and producing strong and many-flowered spikes potted in a compost mainly of sphagnum, in sphagnum and peat in equal proportions, in sphagnum one part to two parts of peat, and in a compost almost entirely peat. Potsherds and charcoal were present in the whole of these. Some growers were using pots in comparison with others small for the size of the plants, others again large. Some had the plants raised high above the pot standing upon a round cone of compost, others had the bulbs just above the rim of the pots, yet the results were equally good. The finest growths of Dendrobium Devonianum were produced from plants which in the one case had not been removed from their baskets for seven years, in the other the plants were shifted every season. And so we might go on enumerating instances to prove that success in the culture of Orchids depends very greatly on the amount of care lavished on them.—R. P.

THE OLD YELLOW ROSE.

In your issue of the 3rd July you answered some inquiries relating to the Old Yellow Rose, and gave a quotation from Parkinson's "Paradisus" describing it. Perhaps in the interests of your subscribers of antiquarian turn you will permit me to quote a passage from a letter of Sir H. Wotton, in which a still earlier reference is made to a double yellow Rose, which I take to be the old Rose in question. Sir H. Wotton, whose name will be familiar to most of your readers through the pen of Izaak Walton, was in 1622–23 our Ambassador at the Court of Venice. His letter of this date is addressed thence to the edition, 1685, pp. 317, 318). After reporting to the Earl that he had sent to His Majesty King James I. some of the best Melon seeds of all kinds, "with very particular instruction in the culture of that plant," he proceeds—"By the present bearer the culture of that plant, he proceeds—By the present bearer I do direct unto your lordship through the hands either of my nephew or Mr. Nicholas Pey (as either of them shall be readiest at London), for some beginning in this kind of service, the stem of a double yellow Rose of no ordinary nature, for it flowereth every month (unless change of the clime do change the property) from May till almost Christmas. There hath been such care in the manner of the conveyance, as if at the receiving it be presently put into the earth, I hope it will prosper.

Parkinson says the yellow Rose was first brought into England from Constantinople; and in view of the intercourse between Venice and Constantinople at this period it is only natural to suppose that the florists of Venice alluded to in this letter obtained their supply from the same source.

Whilst referring to the early history of the Rose in Eragland

it may interest some of your readers to note the following it may interest some of your readers to note the following specific allusions to its cultivation. A.D. 1521, See Nicolas's "Privy Purse of Elizabeth of York." 8vo., 1830, page 216. A.D. 1558, See "Le Livre des Singularitéa," par. 9, Philomneste, Dijon, 8vo., 1841, page 253, where the following passage occurs—"The Rose was imported from the Isle of Zante, 28th June, 1552." A.D. 1580-1585, See Tusser's "Five Hundred Points of Good Husbandry," Edit. Mavor, 1812, pp. 21, 88, 121, which establishes the point that Roses were common in England at this period.—FREDERICK HALL.

FORCING VINES IN DULL WEATHER.

I no not like, as a rule, to differ from your correspondent Wm. Taylor, but there can be no greater mistake than to teach the necessity of high temperature for Grapes in sunless and dull weather. I have Muscat Hamburghs beautifully set and colouring finely now, though there has been no fire heat whatever in the houses from the 1st of May till the 19th of July, when for three days on account of excessive cold and moisture fire heat was put on for the first time since April 28th. My average night temperature has rarely exceeded 50°, and in the same house I have both Ferns and stove plants as Dracænas, Coleuses, Allamandas, Stephanotises, Crotons, &c. I only allow the Vines to occupy in this house the east side of a double span house. The border is inside, but with arches through which the roots of the Vines can pass into an outside prepared border made of turf, broken bones, and good farmyard manure. The soil is light. The Vines, only four in number, were first grown in pots and fruited in pots in 1877, planted that autumn, and now in 1879 have each of them two or three canes which take the full length of the rafters—18 feet. The sorts are Muscat of Alexandria, Muscat Hamburgh, Dr. Hogg, and the ordinary Black Hamburgh. The Vines are regularly syringed, especially when in bloom, and I never find the least difficulty as to setting. The last and more backward crop of the four is oddly enough the Black Hamburgh, but I think almost entirely because it was over-fruited when a pot plant. The bunches of Muscat Hamburgh are particularly fine and are colouring beautifully and evenly; I may say the same of Dr. Hogg. There are fourteen bunches of Muscat Hamburghs, and those at the upper part of the house where the heat rises are at least a fort-night in advance of those of the lower. I find no difficulty in the setting of the Muscat of Alexandria, though, as I wished to get three strong canes I have not left many bunches, but for an experiment I am allowing a bunch at the top of the house from wood of this year's growth to bear fruit to see whether it will ripen this winter.

The house is a double span, but it also has a hip to the south and the glass to the north, and the back wall to the north is only 6 feet 6 inches high. The glass is all large—i.e., either 20 by 16 inches or 24 by 20 inches, set the wide way of 20 inches. My object being to gain every ray of light, I never shade, only occasionally put on whitewash with paste and milk if the weather should be too scorching, but such has not been our fate this year. Every plant in the house stands level with the glass on wood stages made of strips of 1-inch deal 3 inches wide. All the hot-water pipes for winter use are

under these stages, but none touch the ground.

Mr. Taylor protests against extreme pruning; I only know that with me, if I did not keep the pruning scissors constantly going to admit light and air, especially in wet sunless weather, I should not get a quarter of the crop of fruit which I have at present, which, as I ventured to state in your last issue, is in some cases extraordinary. Luckily after a pouring wet day on Sunday the 20th, when 0.75 inch of rain fell, followed by a cold drizzly wet day on the 21st and a blustery but drying-up

cold drizzly wet day on the 21st and a blustery but drying-up day on Tuesday 22nd, we have had (and I am writing this Friday evening the 25th) three very fine days with bright sun after eleven, and followed by cold clear nights.

In all my experience of Strawberries I have never seen so great a promise of fruit. We only began to pick on the 28rd, but if only by any fortunate chance the present weather continues we shall be picking by the hundredweight. The greatest transit of numbers are devibed. crops in point of numbers are Garibaldi, Newtown Seedling, President, Lucas, Sir J. Paxton and Traveller; but out of twentyfive sorts I cannot record a single failure, and many Strawberries of James Veitch and President, though not perfectly ripe or fully grown, weighed from 1\(\frac{1}{2}\) oz., to 1\(\frac{1}{2}\) oz., in three dishes picked on the 24th. The beds are never forked, the soil is light loam, but the plants are mulched in winter with good farmrard manure and planted 2 feet apart, three plants being put into each clump in a triangular form 6 inches apart. Some of these only planted last September have good crops now, whilst those planted in the autumn of 1877 are in extraordinary bearing. The plants are kept free of runners all the autumn, and all the runners are removed after the blossoms are set. Straw chopped through an ordinary chaff cutter is strewn all over the beds and into the crowns of the plants, and when the fruit is well ripening herring nets are thrown over all the plants to protect them from birds.

Since writing the above I weighed two Strawberries picked on the 26th of James Veitch; one was 2 ozs., the other 12 oz., and

a President also 1½ oz.—C. P. PEACH.

DIANTHUS HEDDEWIGII DIADEMATUS AS A FLORISTS' FLOWER.

I HAVE some fine specimens of the double Dianthus blooming at present, with flowers of good form and substance, and making a brilliant show. Beside them are beds of double red and striped Carnations, Antirrhinums, and Pansies; and looking at and comparing their relative beauties induces me to ask, Why is not the double Dianthus also included in the usual lists of florists' flowers, or why is it not more extensively cultivated? A comparison of either of those named which are so included would be altogether in favour of the Dianthus. In colour, beauty, and usefulness it is superior. Why is it not included in the schedules for which prizes are given? If it was we should have still finer varieties than those brilliant single gems Crimson Balle, Eastern Queen, or the still finer Laciniatus splendens, which some short time since were deservedly such objects of praise and admiration. The question here arises, What are the characteristics of a florists flower when considering its claims to rank as such? I take them to be-1, that beauty, shape, and form must make them desirable; 2, to be easily capable of perpetuation and propagation; 3, the capacity of producing new varieties; and 4, to be in such demand and to be so suitable for garden or conservatory decoration as to be objects of value to growers and the trade.

Permit me to urge the claims of the Dianthus under each of these heads in a few brief observations. I have principally in view the double variety, but the brilliant single ones already named should be in every collection—indeed some prefer them, while they have the additional recommendation there is a certainty of their coming true from seed. 1, I have already referred to their beauty in contrast with other florists' flowers, and have yet to learn any hardy outdoor flower, perhaps excepting flamed and feathered Tulips, with colours more brilliant; and that they are desirable for bedding or lines anyone who has seen their rich glow does not require to be convinced. As, however, the heads of bloom are heavier than Carnations, and the stalks not so well able to bear their weight, carnations, and the stake not so well able to bear their weight, it is in every case necessary they should be carefully staked and tied to be effective. The pleasure, gratification—in fact the success or failure, especially in such weather as this, often depends upon such a comparatively small matter as neat staking and tieing. It would be utterly impossible to admire the finest flower coated over with clay thrown up by a heavy shower, which showers unfortunately are now the rule, not the excep-tion as in former summers. This remark applies, I find, very generally to bedders that never needed such attention before.

2. Propagation. This can be effected by seed and layers; and though I have not tried, I have no doubt also by cuttings and pipings. If you want to perpetuate a good strain as you would any other florists' flower, top-dress or give liquid manure during the flowering stage, and side shoots in abundance will be formed. These can be shifted off and planted. If some sandy soil has been put carefully around them they will probably be rooted into it. I have a 4-feet window box gay with their brilliant blooms at present, and with plenty of young side shoots fit for planting, and without further attention than some liquid manure at intervals, which added much also to the size of the blooms. It must always be remembered that, like all the other Dianthus family, if you do not have those shoots the first or second year you may the third—I have kept no plants longer—so that a very good variety need not be lost. From the perfect doubles you obtain no seed; so that this system of propagation becomes most convenient. The semidoubles produce seed which, if a g od strain, should be pre-served; but care must be taken, as the pods open in an hour's hot sun.

3, This brings me to the third recommendation of these plants, the power of producing new varieties; as it is only from seed those can be had. Then I would say. While you should preserve a good strain when you get it, sow a mixed packet occasionally from a respectable firm, with the hope of getting something new. The greater the number of your varie-

getting sometiming new. The greater the number of your varieties the better the chance of a really good hybrid.

4, To be in commercial demand. Whatever the demand has been hitherto, I am persuaded if a fraction of the readers of the Journal gave this Dianthus a trial, and were as well pleased with it as I am sure they would be, the culture would be as extended as its great merits deserve, while I hope I have shown it to be in new yor deficient in the characteristics of a florists. it to be in no way deficient in the characteristics of a florista' flower.—W. J. M., Clonnel.

FRUIT PROSPECTS.

JUDGING from the reports of the fruit crops in the Journal, "failures," we are sorry to notice, is the general cry. The loss of the Apple prospect is the most serious; but we sincerely hope for more favourable reports from some of our southern growers. We have had as yet no summer—no sunshine to help us in our difficulties. We had here on June 26th a very heavy hailstorm which lasted two hours. Our Lettuces, Beans, Celery, &c., are terribly cut, and the bedding plants and fruit trees were left almost leafless.

Of the fruit crop happily I can give a more favourable report than many of your correspondents. The Pear trees are carrying an average crop. The following varieties are carrying heavy crops:—Jargonelle, Beurré Hardy, Brown Beurré, Louise Bonne of Jersey, Seckle, Dunmore, Gansel's Bergamot, Winter Nelis, Joséphine de Malines, I might add that the above-named varieties are all grown as espaliers. Of Apples I cannot give a good account, as the pyramids are a complete failure, excepting Lord Suffield, Golden Pippin, and Cox's Orange Pippin; these are looking well. The standard trees are carrying half a crop. Plums are abundant—Victoria, Green Gage, and Coe's Golden Drop are very heavy crops. Peaches and Nectarines we do not grow outdoors. Our Apricots are a failure, although they bloomed well. Bush fruit such as Currants and Gooseberries are plentiful, also Raspberries and Strawberries; but late Black Prince Strawberries. standard and other trees; but if this wet and cold weather continues long we may still expect great disappointments. We observe after the past severe winter that slugs are more troublesome than ever, as well as aphides and caterpillars. In most of the gardens round this neighbourhood the Goose-berry trees are leafless owing to those destructive caterpillars. We found that soot dusted over the trees dislodges the pest, but I do not recommend it to be used, as it disfigures the fruit; but a cleaner and more effective remedy is quicklime and dry sand in equal parts mixed together and dusted over the bushes. The catespillars will fall the moment the mixture touches them. - JOHN LLOYD JONES, The Mount, Congleton, Cheshire.

NOTES AND GLEANINGS.

WE have received from the Royal Horticultural Society a list of the Fellows elected from January to June of the present year. The number in January was eighteen; in February twenty-five; in March twenty-one; in April twenty-four; in May fifteen, and in June twenty-three. Total 126.

- AMIDST the general outcry of damaged fruit and other crops, the result of this unusually wet season, it is pleasant to find something that appears to be an exception to the general rule of failure. This exception is certainly afforded by ORNA-MENTAL TREES, particularly the Conifers and their allies, for rarely are they seen to better advantage than at present. Here in the customary scorching July with the consequent attendant sered and exhausted foliage, we still see the Elm, Oak, Lime, Ash, and innumerable other trees bright with fresh reen foliage that in some instances rival the vernal tints. green foliage that in some instances and Arbor-Vitæs this Uncommonly fine are the Golden Yews and Arbor-Vitæs this season, the colour deep and good, and the growth free. The beautiful Retinosporas are also in excellent condition, and even in some situations where they usually succeed but indifferently they appear as well as could be desired.
- On the ROCKERY IN THE ROYAL HORTICULTURAL SOCIETY'S GARDEN at Chiswick several interesting little plants are flowering, which are well adapted for similar positions in gardens generally. Of these the dwarf Campanulas are especially noticeable, particularly such as C. garganica, C. car-

patica alba, C. turbinata, C. muralis, and C. fragilis. A pretty plant for a shady nook is Orchis foliosa, with its large dark green glossy leaves and tall spikes of pale purple flowers; and equally good for clothing a bare and conspicuous corner of the rockery is the attractive Thymus rotundifolius, of which the small reddish purple flowers are so numerous as to form a charming little floral carpet. Stenactis speciosa is a beautiful member of the order Compositse. It grows from 1 foot to 18 inches high, and bears a great abundance of flowers during the summer months. The outer ligulate florets are of a pleasing and distinct lavender blue tint, the centre florets being yellow. This is a Californian species, and first appeared in this country about 1831.

"AT Messrs. Veitch's Nurseries, Chelsea," writes a visitor, "is a houseful of the finest varieties of TUBEROUS BEGONIAS, which are now very gay. Some salmon-coloured seedlings are very effective. Brilliant, Le Géant, and Monarch are the finest of the named varieties. A number of Abutilons are also in bloom. Boule d'Or will prove a capital companion to Boule de Neige, from which it is distinguished merely in the colour of the flower. These, with A. Darwinii tessellatum, are the three best varieties up to the present time."

- DR. DENNY regrets that an unavoidable circumstance prevented arrangements being made for the members of the PELARGONIUM SOCIETY dining together at Swanley on the 30th inst. as we announced by his request in last week's issue of the Journal. We are also requested to state that the intimation which has been circulated that "the members of the Floral and Fruit Committees of the Royal Horticultural Society will dine together at the Lullingstone Castle Hotel, Swanley, on Friday, August 1st, and would be pleased to find that some of their horticultural friends would join them," is made without any authority whatever, no such arrangement having been sanctioned by either of the Committees, or by any act of the Council of the Royal Horticultural Society.

- No plants in Battersea Park have been more attractive during the past three weeks than FUNKIAS. The finest of them is F. subcordata. A marginal row of this species near the charming tropical nook is splendid, and equally attractive also are plants dotted here and there on the sides of grassy mounds. Some of the plants are 3 feet in diameter and have about thirty flower spikes, each bearing about as many flowers. The cool wet summer has evidently suited these plants, which we have never seen so fine before.

- In the large VINERY at Chiswick there is a fine crop of Grapes now swelling rapidly, and the general condition of the Vines is all that could be desired considering the disadvantageous season we have experienced. The growth is vigorous and firm, the foliage healthy and clean, and the bunches although not large are of a very useful size, and the berries appear to be swelling evenly. The laterals were also free from the defect we have noticed in so many instances—viz., the loss or non-production of leaves from their base, for here the foliage is good down to the spur, and the lower buds are plump and promising.

— If a period of bright sunny weather should now set in-of which we have had a few uncertain signs, SHADING will become necessary for Cucumbers, Melons, Vines, &c., owing to the tender and succulent condition of the foliage. Without the tender and succulent condition of the foliage. this precaution scorching and irremediable flagging will prove disastrous to the foliage. Another point also deserving attention is the mulching of borders generally, for the roots of Vines and plants are very near the surface, and drought would now be exceptionally injurious to them.

OUR correspondent "J. R. S. C." writes as follows: "In regard to the correction in the article on 'COWPER AS A GARDENER,' I wish to state that I fully believe I wrote 'Weston, as I am well acquainted with the poet's history; it was probably a misapprehension on the compositor's part."—[It was.]

In consequence of the inclemency of the weather the DEVIZES HORTICULTURAL SOCIETY'S SHOW is postponed until Tuesday and Wednesday, August 5th and 6th.

WE have received a PLAN OF THE KING'S ACRE NUE-SERIES, HEREFORD, which are to be let on lease. These nurseries, established in 1785, and carried on for the last thirty years by the present proprietor, Mr. Cranston and co-partners (who are retiring from business), are famed for Rose culture. They possess the advantages of a favourable climate and a rich soil, and are in excellent condition. The grounds are situated within two and a half miles of the city of Hereford. The quantity of land now under cultivation in these nurseries for Roses exceeds 30 acres, and there are ten propagating and other hothouses devoted entirely to their culture. Thirty acres are devoted to fruit trees and Coniferæ, and forest trees and evergreens are largely grown. A seed farm has recently been added, which adjoins the nurseries, and consists of about 43 acres of first-class land. The glass houses are all well and substantially built, and are in excellent preservation, many of them having been only recently erected, and the buildings and offices are admirably arranged. The extent of the nurseries and lands is as follows:—The King's Acre Nurseries, house, solidings, cottages, and land, 67 acres, 3 roods, 16 perches; offices, stables, and nursery, 2 roods. Crab-Tree Field Nursery, 5 acres, 3 roods. Baskerville Cottages, gardens, meadow, and Cross and Hand Nursery, 4 acres, 1 rood, 35 perches. Seed farm and buildings, 43 acres, 2 roods, 35 perches. Seed Ware-house and Premises, Broad Street, Hereford.

- THE Committee of the Bulb and Seed Merchants' Society at Haarlem has been commissioned by the General Meeting of July 21st, 1879, to give notice that the EXPORTATION OF BULBS will this year take place later than usual. The unfavourable season and the rainy weather have caused great delay in the labour and the drying of the bulbs: it is therefore in the purchasers' interest to allow to the suppliers the necessary time for the delivery of the bulbs in a dry condition.
- MR. JOHN BARRY, late gardener to Josa De Canto, Esq., St. Michael's, Azores, has succeeded Mr. Shaw as gardener at Kirklington Hall, Carlisle.
- AN instance was recently recorded of FRUIT TREES on a south wall having been INJURED either by the severity of the winter or the inclemency of the spring, while other trees on east and west aspects were comparatively healthy. A striking example of the nature indicated came under our notice the other day at Garbrand Hall, Ewell, the residence of Mrs. Torr. A great length of the boundary wall of the garden faces the south; the wall then turns rather suddenly, and the aspect is a south-easterly one. On this, the south-east aspect, the Peach and Nectarine trees are as clean and healthy as can be desired; but on the south aspect the whole of the trees are not injured merely, but actually dead. It is a deplorable and complete wreck, which Mr. Child, who is a sound and intelligent gardener, finds a difficulty in accounting for. The wall will now be covered with other trees than Peaches: it is very suitable for diagonal cordon Pears, which would have a pleasing effect, and would then produce superior fruits. A note on some of the attractive features of the garden must be deferred.
- IN Mr. W. Bull's nursery at Chelsea the very handsome LILIUM AURATUM CRUENTUM is now flowering. This is a distinct and beautiful variety of L. auratum, and is one of Mr. Bull's recent importations. The flowers have the form of the species, but are remarkably distinct in colour: down the centre of each division of the perianth is a stripe of deep crimson, and numerous spots of a darker hue, the body colour and margin being white. This is a valuable acquisition.
- A COBRESPONDENT informs us that the first Rose Show of the SHEOPSHIRE HORTICULTURAL SOCIETY was held in Shrewsbury on the 23rd inst., and proved "not only a good exhibition but a financial success."
- —THE present season suits the beautiful ESCHSCHOLTZIA MANDARIN admirably, and if the plant flowered as freely and brilliantly every season as it is now doing at Chiswick too much could scarcely be said in its favour. Very bright and hot weather is evidently adverse to the well-being of this plant, which by-the-by we may remark is a variety of E. crocea that was sent out by Messrs. Carter & Co. in 1877, and it was certificated at one of the meetings of the Royal Horticultural Society. It is well adapted for grouping in masses, as the externe rich orange colour of the expanded flowers is then very effective. The flowers in a young state are also showy, for the under side of the petals and the buds are of a fine scarlet hue.
- —— ACID REACTION OF FLOWERS.—It was stated, as the result of observation, by MM. Fremy and Clöez, that the juices of all red and rose-red flowers showed an acid reaction, whereas the juices of blue flowers were always neutral, or even weakly alkaline. The subject has been studied afresh by Herr Vogel, who examined one hundred species—viz., thirty-nine blue, forty-four red, six violet, eight yellow, and three white flowers. The experiments (described to the Munich Academy) confirm the view that it is not warrantable to attribute the red colour-

ing of flowers to action of acids or acid salts on blue colouring matter, or to attribute the latter to the influence of alkalies on red colouring matter, though doubtless there is a certain relationship between certain red and blue plant colours. It further appears that the opinion that plant juices generally, and even the majority of flower juices, have an acid reaction is pretty correct; among one hundred flowers there were only twelve which did not react acidly. On the other hand, the rule above referred to is not found to apply universally, for among thirty-eight blue flowers twenty-eight showed a decidedly acid reaction, though the degree of the acidity was less than in red flowers.—(Nature.)

— A CORRESPONDENT writes—THE BOWLING GREEN that I am connected with has given the members an immense amount of trouble this season owing to the enormous quantity of worms that have made their appearance; and although large quantities are being extracted they still continue to increase, and at times have rendered the green quite unfit for bowling. I should be glad if some of your readers could suggest some means by which the worm nuisance could be exterminated from our green.

— A BEAUTIFUL bulbous plant for the border is TRITELEIA MURRAYANA, and it forms an excellent companion for T. longipes. The height of the plant is about a foot, and the pale purple or lilac flowers are borne in large umbels, which are produced very freely, and are very durable. A rich light soil seems to suit the plant admirably.

—— THE double white variety of LYCHNIS DIOICA is very useful both as a border plant and for yielding a supply of neat blooms for cutting. The plant also succeeds well in a pot, and we recently saw an instance of its adaptability to this purpose in Mr. John Riches' nursery, Lower Tooting.

CHOICE GARDEN ORCHIDS.—No. 6.

ETYM.—Named by Dr. Lindley after William Cattley, Esq., of Barnet, a great encourager of botany, a celebrated orchid-

ologist, and his personal friend.

A large genus of Orchids, which are special favourites with the cultivators of this order, both on account of their large flowers and also from the exquisite colours they display. They are pseudobulbous epiphytes, bearing one, two, and sometimes three coriaceous leaves. The flowers are borne upon terminal racemes, which are produced from the axils of the leaf or leaves. Sepals and petals fleshy, spreading, the latter mostly largest; labellum or lip cucullate, enclosing the column, three-lobed; column clavate, semiterete, articulated with the lip. The genus differs from Lælia in having four fleshy pollen masses instead of eight.

CULTURE.—The smaller-growing species thrive admirably on blocks of wood suspended from the roof, but the larger ones become starved when treated in this manner, and should therefore be grown in pots. For this purpose use good fibrous peat which has been well cleared of all the fine gritty soil, adding a small portion of living sphagnum moss and a little sharp silver sand; drain the pots thoroughly, and in potting set the plants upon the top of the soil, which should be elevated into a little cone above the rim of the pot in order that the water may rapidly pass away. Cattleyas do not require a very high temperature. The majority of the species may be successfully grown under the shade of Vines in a cool grapery. During the growing season they enjoy a liberal supply of water at their roots, and a genial moisture should be maintained in the atmosphere. By all means, however, avoid the too prevalent error of producing this by syringing, for these plants do not like syringing; or rather the artificial system of cultivation which we adopt by placing them in pots allows the water from the syringe to lie in the large imbricating sheaths which envelope the young growths, and always injures them partially, whilst in many instances it causes their total destruction. The smaller species and varieties growing upon blocks are not subject to this fatality; their pseudobulbs not being erect, the water runs aways quickly, as it would were they growing upon branches of trees in their native habitats. The pseudobulbs being matured, water must be partially withheld, and less moisture kept in the atmosphere in order to give the plants a season of rest. We do not advocate the withholding of water entirely, as excessive drought causes the pseudobulbs and leaves to shrivel; this throws the plant into bad health, and we usually moderate drying will prevent the latent buds from starting into |

In the matter of cleaning and the destruction of insect pests growth, and enable the plants to bloom more freely; for buds which start prematurely into growth not only finish very weakly but rob the pseudobulbs from which they spring of the power to produce the flowers which they should in due temperature and atmosphere are kept in a congenial state, but season.

experience amongst Orchids that they will come, and we never yet saw a collection absolutely free from them. Cattleyas are mostly natives of Brazil, New Grenada, and Central America, the whole genus being entirely confined to the western hemisphere. Temperature.—Summer, 70° to 80° by day, 65° to 70° by night; winter, 65° to 70° by day, about 60° night.

C. Acklandiæ, Lindl. (fig. 9). Bot. Mag., t. 5039).—Pseudobulbs slender, furrowed, somewhat oblique at the spex and

about 6 inches in length, bearing two ovate, submarginate, coriaceous, small dark green leaves. Flowers in pairs, large, varying considerably in the intensity of their markings in different plants; sepals and petals (normally) rich chocolate brown, transversely barred with streaks of yellow; lip large, three-lobed, the middle lobe largest, fiddle-chaped and spread-ing; colour deep rich purplish rose, the side lobes are rotund, small, and unable to enclose the column. It blooms during the menths of May, June, and July, sometimes flowering twice in the year. Native of forests in the neighbourhood of Bahia. 1839.

C. bicolor, Lindl. (fig. 10). (Bot. Mag., t. 4909).—Pseudobulbs stem-like, very slender, deeply furrowed, and upwards of a foot in height. Leaves in pairs, spreading, oblong lanceolate, obtuse. coriaceous, carinate, deep green on the upper side, paler below, Scape terminal, erect, sheathing at the base, five to ten-flowered.

Flowers 3 to 4 inches or more in diameter; sepals oblong lanceolate, somewhat falcate, acute; petals a little larger, broadly spathulate, the whole being of a uniform coppery-green colour; lip oblong-cuneate, slightly reflexed, the apex broad and bilobed; colour deep rosy purple or magenta, with a white margin; side lobes absent, leaving the large column quite exposed. It blooms during the summer months, lasting long in perfection. Native of Brazil. 1838.

C. Schilleriana, Rchb. fil.—This beautiful species and its variety Regnellii are dwarf plants, resembling somewhat a robust-growing form of C. Acklandise; but, though at first sight bearing some affinity with the last-named species, the large side lobes which envelope the column and which in C. Acklandise are so small that this organ is left quite exposed, will at once form a distinguishing character. Pseudobulbs clavate, 3 to 6 inches long, deeply furrowed, supporting from one to three leaves; two, however, is the most usual number, these are oblong-obtuse, alightly bi-lobed at the apex, coriaceous in texture, and dark green. Scape short, erect, two to four-flowered, measur-

ing 3 to 4 inches in diameter. Sepals oblong-ligulate, with many margins, dark green outside, the front being of a dark coppery hue with green margin, and irregularly spotted with dull purple; petals marked in the same manner, but narrower; lip large, three-lobed; side lobes white tinged with rose, cucullate, spreading outwards at the points, where they are richly marked with bright crimson; middle lobe broad and flat, very narrow at the base, where it is yellow, front portion bright crimson, reticulate with lines of a deeper hue, margin white, prettily and finely toothed; colour white tinged with crimson at the apex, and pressing close on the base of the

middle lobe of the lip. It should be grown upon a block of wood. Blooms during the summer months. Native of Brazil. 1859.

C. Schilleriana, var. Regnellii, Rehb. fil. (Warn. Select Orchid, t. 22). Syn., Cattleya Regnellii, Hort.; C. Schilleriana purpurea, Hort.—In general habit there is very little indeed to distinguish this from the species. The flowers, however, vary considerably, and it has also the peculiarity of flowering twice in the year. Sepals and petals somewhat oblong, becoming spathulate towards the apex; ground colour deep olive green, transversely marked with large oblong spots of rosy purple; lip three-lobed; side lobes cucullate, spreading outwards, white tinged with purple, inside deep amethyst; middle lobe narrow at the base, where it is yellow, marked with five parallel lines; front portion deep amethyst, with white margin and dentate edge; column pressed close upon the lip, rosy purple at the apex. It blooms in July, and again in October. Brazil. 1859.

SYRINGING VINES-RED SPIDER.

It appears from the remarks of "SINGLE-HANDED," on page 43, that he is afraid that if syringing is dispensed with good Grapes with a heavy coat of bloom will cease to exist. I think not. I had the pleasure of seeing some vineries a short time ago where the syringe is never used after the Grapes are set, and red spider is unknown. As to using the syringe after the fruit is coloured without destroying the bloom, the merest tyro in Grape-growing will at once see the impossibility of the feat, no matter what amount of "dodging" is resorted to.

of the feat, no matter what amount of "dodging" is resorted to.

Whatever may have been "SINGLE-HANDED's" experience
of the application of sulphur to the hot-water pipes or flues, it
can be readily proved that it is impossible for red spider or
any other insect to live in its presence. That he succeeds with
his treatment I shall not deny, but to attempt to upset a practice
which has received the support of most Grape-growers in Great
Britain is a step in the wrong direction.—Peter Ferguson.

DID "SINGLE-HANDED" use sulphur before or after the appearance of spider? If he is in this district and will visit my place I will undertake to convince him that syringing Vines is bad practice, and that the timely use of sulphur is good practice. From Mr. William Thomson's treatise on the Vine I received my instructions, and it is only fair for me to state that I attribute much of my success to what I read there. I have mildew all around me, but with well-drained borders and fire heat I have not the slightest dread of it visiting me.—J. WITHERSPOON.

ANTS, SPIDERS, AND ROSES.

On Rose trees, though the foliage is now fine (clean and large), insects have been abundant as well on the dwarfs as on the standards; also caterpillars (common green), and the one which so resembles the stem of the Rose, besides the usual grubs and maggots. Ants are decided enemies of Roses. Some years ago they attacked several of my trees, specially persecuting a La France. It was long before we could free the tree, even by repeated syringings of quassia water. It was a standard tree. We tied nauseous things round the stem. Finally La France recovered, and lives to endorse all that was said by the raiser some weeks since in the Journal of her unique delicate beauty and incomparable character for fragrance and constancy. No Rose is more admirable in habit of growth than La France, and none I think is so free-flower-Like her relations the Tea tribe, she too attains her highest perfection and fullest size in the autumn. to the ants. This year the ants attacked Boule de Neige, eating the buds completely out before they were discovered in them. Spiders I still believe, and a very experienced gardener of great opportunities of observation confirms my opinion, are injurious to Roses, specially, he says, to wall Roses; but I find them on standard trees also, where they will glue up the finest leaves with their tenacious threads. A very vivid green spider does this. The wall spiders are generally brown or black.

Amongst wall Boses Gloire de Dijon has been and is still superb. The wet and sunless atmosphere must have suited it here, the blooms being very large, round, and perfect, the texture of the petals rich and firm, and the whole flower worthy of Canon Hole's eulogium on the Rose he would choose, could he choose but one.

Maréchal Niel, sadly shattered by the terrible winter, and depressed by the continued ungenial weather, has hardly rallied. The blooms are not nearly so abundant nor so well perfected as usual. Climbing Devoniensis, though it also suffered severely, has retained more vigour (these Roses are side by side on the same aspect), and though the flowers are not so profuse as in other years they are scarcely less large. It is a noble Rose, in my eyes the most beautiful of all white Roses, having size, substance, fragrance, and delicacy of form both in bud and bloom. besides being long-lasting in and out of doors. The weather appears to become colder, the 7th inst. excepted, when there was a summer glow in the few hours of rare sunshine. Since then dense thunder clouds have discharged their heavy deluging contents; nor have these rains been followed by the drying winds which, though trying to the tender foliage of the Roses, were useful to the ground, now hardly workable by hand or hoe, and weeds grow strongly where order should prevail.—A. M. B.

CATERPILLARS.

THE larvæ of the sawfly (Nematus grossulariæ), known commonly by the name of the Gooseberry caterpillar, have played sad havoc amongst the Gooseberry trees in the neighbourhood this year. A swarm of locusts could not have stripped the leaves off cleaner than they have done, and of course the crop of fruit is ruined. On my return from Scotland I found my trees much infested with the caterpillars, so I immediately applied soot, which effectually destroyed them; the constant rains soon washed the trees clean again, so that those which were not too far gone are now bearing a good crop of fruit. In other years I have always applied lime finely powdered, it is milder than soot; but when once these pests get well established, and in such a season as the present,

mild antidotes are not to be depended upon.

The way I apply these remedies is this: First, I give the tree a sharp rap, this has the effect of dislodging a large number of the caterpillars; I then shake some soot or lime all around the stem and centre of the bush, especially amongst the young and succulent shoots, for there the caterpillars are generally the most numerous. In a couple of days I look over the trees, again giving a sharp rap as before, and dusting with more lime if necessary. This I have never known to fail, and as I have usually grown Gooseberries by the ton the advice may be worth having. Those who contented themselves by mourning over the destruction the caterpillars were making but did nothing, and those who relied on antiquated nostrums or attempted to pick them off by hand (except in very small gardens), have lost their entire crop, and the trees are injured for another year. Nor is this all; they have inflicted a great loss on their neighbours, for the caterpillars have descended the trees and gone through the pupa stage, which lasts only a very short time (a fortnight or three weeks), and now the perfect insects are flying from bush to bush laying their eggs by thousands. The other day I noticed an extraordinary number of these sawflies (small creatures with yellow abdomens), busy at work laying their eggs, and on turning over the young shoots of the Currant trees I found almost every leaf had the ribs on the under side covered with a chainwork of eggs, so that in less than a fortnight, if nothing be done to check them, the second visitation is likely to be worse than the first.

All who have gardens should look out at once and apply lime or soot if the ravages of these pests are to be checked and the crop of fruit saved. Do not put the soot on too thickly or it will burn the leaves.—F. BOYES.

NOTEWORTHY VEGETABLES.

RUBY POTATO.—Amongst over seventy varieties of Potatoes planted at the same time on one piece of ground Ruby has come earliest to maturity. As its name indicates it is very pretty in colour, and although classed as a kidney in catalogues it might be taken for a round variety. Considering it to be American it is very fair in quality as well as in crop, and wherever a quantity of very early Potatoes are wanted this variety deserves to be grown.

VEITCH'S RED GLOBE TURNIP.—This is by far the best Turnip with which I am acquainted. In shape it is a perfect model, and the quality of it surpasses all others. It is red or purple on the top and white beneath. Its great and valuable peculiarity, however, is the tender and juicy character it re-

tains throughout all kinds of weather; even when heat Apples and Pears have been entirely dissipated. This last is and drought is making others stringy and flavourless before a great loss, being the third failure in succession.—F. BOYES. they are full size this one retains its tender sweetness to the

CARTER'S NEW GREEN-FRINGED LETTUCE.—Were it for nothing else this new Lettuce is well worth growing on account of its beauty, but it has other qualities requisite in a good Lettuce to recommend it. It belongs to the Cabbage section, being dwarf, spreading at first, and ultimately folding into a good head. Every one of the leaves are as much fringed round the edge as the best Curled Endive, and when a number of plants are seen growing on the top of a Celery ridge, as we have them, their effect is very pretty, many remarking they would do as edges to a flower border.—A KITCHEN GARDENER.

LUDLOW ROSE SHOW.

The third anniversary of this well-conducted spirited little Rose Show took place on Tuesday the 22nd inst., and favoured by fine weather drew together a good attendance of exhibitors and the public, and may be pronounced a very creditable success. As usual the Hereford contingent represented almost the entire Krhibition, and it need hardly be stated Messrs. Cranston & Co. among nurserymen and Mr. Jowitt among amateurs carried off every first prize the Society offered. Messrs. F. Dickson & Co. of Chester unfortunately by an oversight lost the second prize in the forty-eight varieties open to nurserymen. A duplicate of that deheate and capricious Hybrid Perpetual Marquise de Mortemar, admirably shown, courting the doom which singly it would equally have helped to avert. THE third anniversary of this well-conducted spirited little equally have helped to avert.

equally have helped to avert.

In Messrs. Cranston's fine collection of forty-eight varieties, single trusses, Hybrid Perpetuals, Etienne Levet, Louis Van Houtte, Marquise de Castellane, Elie Morel (a superb bloom), Beauty of Waltham, Auguste Neumann (very dark), Charles Lefebvre, Marie Baumann (glorious), Duke of Edinburgh, La France, Hippolyte Jamain', (very fine), and a seedling of Mr. Cant's, which Mr. Jowith has this year shown so well in almost all his winning collections and thinks very highly of. This new variety met at last with the distinction it deserves by being individualised at the late Birmingham Rose Show by the name of one of the neighbours and patrons of the raiser, as General Evelyn Wood; at the late Birmingham Rose Show by the name of one of the neighbours and patrons of the raiser, as General Evelyn Wood; and indeed for compactness of shape, usefulness of colour (a clear though not bright lake), and reliableness through such a tricky season as we have been passing, it may honestly be voted an acquisition. Mr. J. H. Arkwright took Messrs. Cranston's second prize for twenty-four varieties, single blooms, and Miss Bulmer the remaining second prizes with blooms well staged and large in size, but somewhat deficient in colour.

Among a few of the local nurserymen and amateurs there was

Among a few of the local nurserymen and amateurs there was room for some slight improvement as regards the blooms they exhibited and their want of style in staging, and this no doubt will take place, as the Exhibition throughout is liberally and efficiently conducted. The suggestion may here be thrown out whether the addition to the prize list of some more remunerative whether the audition to the prize list of some more remunerative prizes to the large Rose nurserymen, who do not now appear at Ludlow, might not be advantageous to the Exhibition, and at the same time become remunerative by the greater attractions such high-class competitors usually bring with them, especially if the scene of Queen Rosa's court was changed to the historic banqueting hall, a charming spot for the occasion, in Ludlow Castle.—
THE HEREFORDSHIRE INCUMBENT.

GARDENS IN 1879.

"NEVER!" This was in answer to a question whether I ever remembered such a season as the present, and I fancy most of your readers would have made the same reply. I pity all who have gardens, and especially those who have been striving to keep them in order: such a thing has been almost impossible. Such a year as the present is one to be remembered, not only on account of the almost incessant rains, but the great absence

Gardeners have had very much to complain of. First there was a winter of unusual severity and a most trying time for planting; indeed those who were not very early had no time to plant at all, and judging from this district I should say the land was never in proper condition to plant anything until late in the spring. Next we had a very cold and backward spring, and following this them has been no summer, but continuous wet and very cold nights. The consequences are that Peas and other vegetables have suffered severely from the sings. The Potatoes are very late, with every prospect of disease. Gooseberries and Currants have suffered much from the enterpillars. It has been almost impossible to gather the Strawberries, though there is a fair crop, but slug-eaten and tasteless; and worst of all, our hopes of an abundant crop of

REVIEW OF BOOK.

The Orchard House. By T. RIVERS. London: Longmans, Green, & Co.

No better testimony of the value of this work, which is devoted to the cultivation of fruit trees under glass, could be adduced than the fact that it has reached its sixteenth edition. The volume is substantially the work of the great master of the art of fruit culture the late Mr. T. Rivers, and has been edited, arranged, and enlarged by the present head of the Sawbridge-worth Nurseries, Mr. T. Francis Rivers. The work is essentially practical and its teachings are reliable, for it does not suggest what may be done in the cultivation of fruit under glass, but records what has been actually accomplished. An instance of the productiveness of an orchard house 100 feet by 24 is tabulated as follows :---

Forty pyramid Peach and Nectarine trees, 8 to		
10 feet high, each two dozen	=	960
Twenty-eight ditto 8 feet, each one dozen	=	336
Sixty-seven half-standards, 4 to 6 feet, each one doz.	=	804
Twenty ditto large, each 2 dozen	==	600
	=	540
Twelve ditto small, each one dozen	=	144
Six standard trees, Peaches, planted)		
out, occupying the space of four each six dozen.	=	432
pyramid trees in pots		
		2816

Or nearly four thousand fruit.

As is fairly observed, the space occupied by the productive, house referred to is only that "of a moderate-sized Strawberry bed."

The culture of fruit trees under glass is no longer an experiment. We are told in the preface of the volume that

"The first of the series of orchard houses from which the practical rules have been prepared was built in 1850. After some years the trees became too large for the small original houses, and larger houses were built. Many of the trees have been twenty-five years in pots, and are still full of fruit and vigour. As the conditions of nve years in pots, and are still full of fruit and vigour. As they have never ceased to bear fruit year by year the conditions of climate and culture must be eminently favourable to the health and longevity of the tree. The long and severe winter of 1878 and 1879 that we have just endured has left my orchard-house trees unexathed. I am afraid that on walls the same immunity will not be enjoyed. The winter will, I am sure, have injured the growth of many Peach and Nectarine trees, and will prove that culture under glass in some form or other must be the only means of ensuring a constant supply of these delicious fruits. In the cold and wet districts of England it is quite hopeless to attempt their cultivation without protection."

How and in what manner that supply can be produced is admirably told in this useful and popular volume. Plain instructions on the erection and cost of cheap and useful houses are given, and the cultural details are clear and explicit. Illustrations of the different styles of houses and trees are scattered through the pages, and render the volume unique of its kind and complete. The cultivation of fruit in the manner described is proved to be profitable. The practice is also a pleasurable one, as is reflected in the closing lines of the book, which we cite-

"I appear in the foregoing pages to have employed a great number of words in the endeavour to make plain this simple, agreeable, and novel mode of cultivating fruit trees. Judging from my own feelings its advantages and pleasures are manifold. Each bud, leaf, and blossom is brought close under the eye of the cultivator. All the minute and beautiful operations of Nature can be closely watched in a genial climate. The silvery covering of the Peach's blossom bud—the beauty of its fully developed flowers (how fresh and happy they always look!)—the anthere shedding their pollen—the germs gently swelling—the downy, ruddy, luscious-looking coat of its charming fruit, are all calculated to give pleasure to the healthful observed, wind, for the lated to give pleasure to the healthful cheerful mind; for the varied works of Nature's laboratory are brought near to the eye, near to the mind, near to the heart, which is instinctively lifted in thankfulness to the Giver of all such good and beautiful things."

NOTES ON VILLA AND SUBURBAN GARDENING.

DURING the cold and wet weather which has characterised the greater part of the present month most bedding plants have suffered severely. Pelargoniums have produced very few flowers but an abundance of coarse foliage, while the Alternantheras and such plants now so much employed in carpet bedding are devoid of colour On the other hand Calceolarias and some of the varieties of Pansies and Violas are thriving admirably, and supply shades of colour that are very desirable during the present duli present dull season. The season for effective display can now only be of very short duration even if the weather becomes bright and warm; therefore all beds and borders should have prompt and careful attention, keeping the grass evenly mown, the edges neatly trimmed, and the beds frequently hoed.

Ress.—Although in most places these were very late in coming

into bloom the foliage and quality of the flowers have indeed been very fine, and never do we remember the darker flowers so striking A few of the light Roses have been disfigured by the wet weather, but the effect of the excess of moisture is very visible in the healthy foliage as well as in the substance and development of the blooms. Their season of flowering is much longer than usual, and unless we have some extremely hot weather there will be good blooms for some time yet. Budding may now be per-formed as rapidly as possible; the stocks are now in good condi-tion for the operation. Carefully select buds that are plump and tion for the operation. Carefully select buds that are plump and firm and of moderate size. Cut away the leaf and remove the thorns; then with a sharp knife tak out the bud, separating the wood from the bark without injuri g the bud itself: then open the bark on the stock by drawing the point of the knife down the centre of the shoot where it is intended to insert the bud, and make a cross cut at the top where the other begins, raise the corners of the bark sufficiently to allow the bud to be fixed neatly in, and then bind with a piece of worsted or neat bass. It will require to remain in this state for five or six weeks, when the ligature may be loosened.

STRAWBERRIES.—Strawberry plants on some soils last much longer than on others, but as a rule two to four years is as long as they should remain without being renewed. The late showery weather has been very favourable to the growth of runners, and the earlier new plantations are made the more prospect there is of a good crop next year. Strawberries delight in a well and deeply dug piece of ground. Plant them in rows 2 feet apart and 18 inches between the plants. The runners are best carefully lifted with a trowel, and if the weather is dry they should be well watered until established; and if this is done at once they may be expected to bear a good crop of fruit next summer.

POTATOES.—Since the heavy rains of the 19th, 20th, and 21st inst. the Potato disease has become visible in many gardens among the early crops. It is surprising how the disease spread during the above days in the neighbourhood of London. Our advice to those who have Potato crops similarly affected is to lift STRAWBERRIES.—Strawberry plants on some soils last much

advice to those who have Potato crops similarly affected is to lift them and plant the ground with Brocooli or winter Kale. The Potatoes will not be anything the worse for lifting even if the skins are not fairly set, and the chances are the greater part of the crop will be saved, whereas if they are left in the ground the disease will affect the whole of the tubers, and the winter crop of greens will be delayed also.

Hedges of all kinds should now be neatly trimmed. Laurel and

all large-leaf plants are best cut with a knife, but Privet, Holly, and Thorn are quickest done with a pair of garden shears. We cut our hedges up to a sloping point instead of retaining a flat top, as we have an opinion that hedges so treated are kept thicker in the bottom.

WORK FOR THE WEEK.

FRUIT HOUSES.

Orchard House. -The fruit trees in this structure Orchard House. — The fruit trees in this structure—such as Apricots, Peaches, Nectarines, Pears, and Plums, will be rapidly swelling their fruit, and water should be supplied abundantly whether the trees are planted out or in pots. Benew the top-dressing of trees in pots as may be necessary, and water with liquid manure occasionally, taking care not to employ it too strong, being guided in its application by the crops the trees are carrying and their vigour. A moist genial atmosphere must be maintained so as to assist the swelling-off of the fruit; and as a means of keeping insects in check syringe the trees freely and means of keeping insects in check syringe the trees freely and close the ventilators between five and six o'clock each evening, except when the weather is warm, when they may remain parexcept when the weather is warm, when they may remain pertially open. Stop or cut back strong growths as may be necessary, in order to admit light and air freely to the fruit and for the purpose of solidifying the growths. Fig trees in pots should still have the young shoots stopped as may be found necessary, affording plentiful supplies of water whilst the fruit is swelling, being careful to avoid any check to the trees, which is almost certain to cause the dropping of the fruit. Syringing will be necessary to keep red spider down, and should be continued until the fruit is ripening, when it must be discontinued or the fruit will be keep red spider down, and should be continued until the fruit is ripening, when it must be discontinued or the fruit will be damaged. Except in very favourable seasons a second crop of ripe Figs is not to be depended upon in a cold house, but trees that are in good health and have had the shoots carefully stopped will afford a second crop little if at all inferior to the first if the trees are removed as soon as the first crop is gathered to a light airy house where they can have the benefit of artificial heat. Grapes in this structure, whether in pots or planted out, will require to have the fruit carefully thinned, cutting out the small

seedless berries and those too thickly placed, so as to prevent the berries from being wedged. The laterals should be kept closely berries from being wedged. The laterals should be kept closely pinched to one joint, especially when trained over the pathway, so that the trees beneath may not be unduly shaded, but the Vines in pots may be allowed to carry as much foliage as can be exposed to light. Cherry trees in pots should, so soon as the fruit is gathered, be removed to a sheltered sunny spot outdoors, to harden the wood and ripen the buds for the following season. If at all infested with insects such as black applies, red spider, den at an intersect with insects such as black applies, red spider, &c, the trees should be thoroughly cleaned by the application of an insecticide and repeated syringings, so as to retain the foliage in a healthy condition as long as possible. The trees must not be allowed to suffer through insufficient supplies of water, the pots

being placed on a good bed of ashes.

Vines.—To insure late Grapes keeping well they need to be early and thoroughly ripened. The latest crops ought now to be colouring. Gros Guillaume and Gros Colman take a longer time in ripening than some others. The two former with Lady Downes, ripening than some others. The two former with Lady Downes, Alicante, Mrs. Pince, Trebbiano, &c., require as high a temperature as the Muscat of Alexardria to finish the fruit off properly—viz., a night temperature of 70° to 75°. Both Muscats and Lady Downes', especially the latter, should have abundance of air, with a night temperature of 70°. Inside borders must not be neglected in watering; those outside in most localities have been sufficiently drenched with rain for the season. Though we advise the extension system, it is not desirable to allow the laterals to get crowded or matted together before pinching them, as it gives a severe check, often resulting in shanking; therefore keep the growths well in hand so as to admit light to have access to every leaf. The excessive rains will have a tendency to keep early Vines with their roots outside growing on to present which leaf. The excessive rains will have a tendency to keep early Vines with their roots outside growing on, to prevent which persist in pinching off all lateral growths as produced, and if means are at command for throwing off the wet employ them so as to induce early maturity and rest. Young Vines should be kept in full growth by the maintenance of a humid atmosphere and a night temperature of 70°, closing early in the afternoon. In order to preserve black Grapes at this season as long as possible it is essential that the Vines have very good foliage in order to prevent the sun from taking the colour out of them, or if the foliage be thin a light shading will be necessary. Examine the bunches occasionally for shanked or decayed berries, and keep the house dry, airy, and as cool as possible.

bunches occasionally for snanked or decayed berries, and keep the house dry, siry, and as cool as possible.

Peaches and Nectarines.—Every attention must be given to trees in the late succession houses as regards syringing to keep the foliage free from red spider, and in watering the inside borders. The shoots must be kept regularly tied-in, and to assist the colouring and ripening of the fruits they should be exposed as much as possible to the influence of the sun and air by removing or shortenpossible to the influence of the sun and air by removing or shorten-ing some of the foliage where too thickly placed. Where the fruit is on the under side of the trellis the shoots may be untied and regulated so as to bring them with the apex to the light, support-ing them in position by laths placed across the trellis. A piece of hexagon netting placed below the trees when the syringing is dis-continued will save any fruit from being bruised should they drop off. In the latest houses give careful attention to syringing, also to watering the inside borders, tying in the shoots regularly, and keeping them rather thin. When the fruit is swelling after stoning close the houses somewhat early in the afternoon, ventilating a little before nightfall.

Cherry House.—The trees should now be as fully exposed to air as the house will admit, which is the best means of arresting premature growth, to which the Cherry when forced year after year successively is liable. The leaves from their hard texture year successively is liable. The leaves from their hard texture are not very inviting to black aphides, but if they appear syringe or dress with tobacco water, and for red spider give an occasional washing with the syringe or engine. The border must not be allowed to become parchingly dry, but must have a copious supply of water, and if the trees are weak add a little guano. Trees in pots must be regularly watered and syringed to maintain the foliage in a healthy state as long as possible. Cucumbers.—These have been more crooked and stunted generally than we remember for a long time, due no doubt to the cold, wet, dull weather. In fine weather fire heat may eafely be dispensed with, but in such dull and wet weather as we have at

pensed with, but in such dull and wet weather as we have at present experienced fire heat will need to be afforded to maintain present experienced are nest win need to be anorded to maintain a suitable temperature. Strive to preserve a healthy root-action by a bottom heat of about 80°, keeping the plants well supplied with water, and occasionally with liquid manure. Let the plants be regularly looked over once a week, removing the exhausted growths to make way for young bearing wood. Syringe moderately at closing time, doing so as early in the afternoon as the brightness of the sun will admit, the ventilators being closed for a couple of hours; then admit a little air for a short time to allow the rank steam or moisture to escape, having the foliage fairly dry before nightfall, especially if fires are dispensed with. The plants for autumn fruiting should be planted out without further delay, planting them moderately firm on hillocks or ridges. In pits and frames former instructions will need to be still followed, removing old and overgroups foliage and county believed. removing old and overgrown foliage and growth, pinching out the growing points above the fruits as soon as practicable.

PLOWER GARDEN.

Flower gardens ought now to be at their best, but owing to the incessant rains during the greater part of July they are in most instances in a miserable plight. Violas, Verbenas, Lobelias, and Calcolarias have made splendid growth: all that is wanted is bright weather, as there is but little bloom on bedding plants. Pelargoniums have produced much foliage, and where the plants retargoniums have produced much foliage, and where the plants are at all thickly placed they become drawn, producing very little bloom. To check this tendency to over-luxuriance many of the large old leaves should be picked off, and where the growths have become drawn and thick the more sappy may with advantage be thinned out. The shoots thinned out may be inserted in sandy soil fully exposed to the sun. The season has not only been unfavourable for the Zonal Pelargoniums, but the Tricolor and soil inly exposed to the sun. The season has not only been unfavourable for the Zonal Pelargoniums, but the Tricolor and Bronze varieties have not made such headway as might have been expected, owing no doubt to the ground being so cold. The propagation of the variegated Pelargoniums is put off until a late period of the season, as many do not like to commence cutting the beds directly they begin to fill and look well; indeed it is not desirable to make gaps and spoil the appearance, as is too often done at a much later period. Where there is a reserve garden we advise the propagation of the variegated section to be proceeded with as soon as possible, and when these are in follow with the green varieties, for they strike much more readily and winter much better. Even Verbenas, Heliotropes, Cupheas, &c., will strike now in a cold frame, whereas later on they require a hothed, neither affording such stocky plants nor wintering so malely as the earlier-struck plants.

Carpet Beds.—These are taking the "shine" out of every other description of bedding, especially as many of the plants now employed for the purpose are hardy. Make a point of looking over the beds for the purpose of pinching and pegging twice a week, so as to keep the lines, &c., distinct, as no beds pay so well for attention as these. Subtropical gardens are not always practicable, as from the largeness of the foliage, as well as in some instances stateliness of growth they require sheltered arous, and

for attention as these. Subtropical gardens are not always practicable, as from the largeness of the foliage, as well as in some instances stateliness of growth, they require sheltered spots, and where such exist no more effective display can be produced than is afforded by these plants. Protect from wind and storms all tall growers by timely stakings. Dahlias and Hollyhocks should be tied as they progress in growth, thinning out the side shoots of the former where too crowded, as an open head will afford much finer blooms. Clematis and Tropseolums should be trained early but avoid too much stiffness, which certainly spoils the mach niner blooms. Clemans and Tropecolums should be trained early, but avoid too much stiffness, which certainly spoils the effect in all but the most formal arrangements. Continue to tie and support the various border flowers as they advance in growth and require that attention, removing dead flowers and seed pods from such as are going out of bloom. Pipings of Pinks may still be inserted; any that are rooted may be planted out. Carnations and Piontees should be at one lawared against and in your planted. be inserted; any that are rooted may be planted out. Carnations and Picotees should be at once layered, sowing seed in pans placed in cold frames. Cloves strike freely from pipings inserted in sandy soil covered with a handlight on a north border or shaded from sun. Roess have had a hard time, but are improving, and they should have every encouragement. Rhododendrons should have the seed vessels removed, also Azaleas. Lawns never looked better than this season, and the foliage of deciduous trees in the seed of the season. is grand. Conifers are making splendid growth. Weeds are very abundant. Hand-weeding is a tedious, but in a wet season the only sure, mode of having walks, beds, and borders in order. Ragged edgings are equally objectionable, and should be frequently trimmed with the edging shears.

PLANT HOUSES.

Orchids.—The temperature of the East India house may range from 75° to 85° by day, with an average night temperature of 65°; the Cattleya house about 5° less. Continue the same general treatment for the occupants of the East India house, dispensing almost entirely with shading on the Cattleya house, shading only amost entirely with shading on the Cattleya house, shading only when the sun is very bright, as to leave it off entirely may have disastrous consequences. Early-flowering plants will in many cases require to be removed to a cooler house, their growths being completed where the heat and moisture is less and a larger supply of air can be admitted. Dendrobium nobile, D. Cambridgeanum, and many others should be placed where they can receive all the light and sun to ripen their new growths. Cattleyas making their growths should receive every encouragement, it being a good plan to place a lump of peat underneath the growth so soon as they to place a lump of peat underneath the growth so soon as they are sufficiently advanced, which induces an earlier production of roots and in a measure protects them from insects. Calanthe vestita and C. Veitchi should not be shaded any longer, but be liberally supplied with water for some time yet. Woodliee are very destructive to the young roots of Orchids, therefore watch carefully for them. If there be any thrips, which are often troublesoms at this season, fumigate frequently, washing the foliage with soft seap, about 3 ozs. to a gallon of water, sponging afterwards with clear soft water. The Odontoglossums have had a fine time this season, as there is not much difficulty in maintaining coolness and moisture, which suits these plants admirably.

TRADE CATALOGUE RECEIVED.

Messrs. T. H. P. Dennis & Co., Anchor Works, Chelmsford.-

TO CORRESPONDENTS.

BOOKS (Manus Hall).—Perhaps "Earley on the Mushroom," published by Bradbury, price 1s., will suit you.

EMIGRATION (J. H.) .- We are not acquainted with the Company to which you refer, nor of the advantages which the country named offers for emigrants. In a matter of so much importance we advise you to act with due caution and consideration, obtaining, if possible, the advice of someone who has had experience of the territory that has been brought to your notice, and of the working of the system suggested.

TEA ROSES TO FLOWER AT CHRISTMAS (Master George).—If the plants require more pot room it should be given at once, merely removing the losse soil and crocks and affording pots 2 to 3 inches larger in diameter. Place the pots on sahes, allowing the plants plenty of space and keeping them well supplied with water, and when the pots are filled with roots water occasionally with liquid manure. Remove all flowers up to the early part of September, when any straggling growths should be cut in, and in October place the plants in a light airy house.

BLOOM ON GRAPES (Idem).—It is being formed from the time the stoning is completed until the Grapes are thoroughly coloured, hence the most experienced Grape cultivators do not syringe the Vines after the swelling. Some do not syringe after the berries are set.

Some do not syringe arrer the cerries are set.

Rose (Mrs. Henderson).—The description answers to Dundee Rambler, white tinged with pink, but it is not Tea-scented, which would point to its being Ruga, a beautiful and fragrant Rose of a pale fiesh colour. The Ayrahira Roses have been originated from Rosa arvensis, or creeping single white Rose of our woods and hedges, which being crossed with some of the hybrid kinds has acquired much additional vigour, as all hybrid Roses almost always do whether the impregnation be artificial or accidental. They are marked by very strong growth and free-blooming qualities.

They are marked by very strong growth and free-blooming qualities.

DESTRONING WEEDS ON WALKS (Idem).—We do not know what is the price of vitriol, but you may ascertain the lowest price by inquiring of a wholesale druggist. For destroying weeds in walks, &c., dissolve I fb. of powdered aresnic in 3 gallons of cold water, boil and keep stirring; then add 7 gallons of cold water and 2 fbs. of crushed soda, and stir the whole well whilst boiling. Apply to the walks in dry weather, taking care to keep it from the grass or Box edgings. The above will be sufficient for 25 sq. yards.

rom the grass or Box edgings. The above will be sufficient for 25 sq. yards. Roses For BEDS (Bury).—You could not have six better dark Roses than Senateur Vaisse, Charles Lefebvre, Duke of Edinburgh, Prince Camille de Rohan, Madame Victor Verdier, and Fisher Holmes, Alfred Colomb being a grand bedder. Six rose-colour varieties are Marquise de Castellane, Mons. Noman, Anna Alexieff, La France, Lyonnaise, and Marte Louise Pernet. Those may not have the perfume desired, but are best for the purpose. Some highly soented Roses are Marie Théresa, rose colour; Rosy Morn, peach shaded salmon-rose colour; Queen Riesanor, pink; Oxonian, rose; Souvenir de Louis Van Houtte, crimson changing to violet; Marchioness of Exeter, rose, fiushed cherry red; Mdlle. Marguerite D'Ombrain, satiny rose; May Quennell, carmine shaded crimson; Madame Vidot, pale fiesh; Madame Engène Appert, rosy pink; Madame Ferdinand Jamin, rose carmine; Charles Baltet, carmine red; Baronne Louise Uxkull, rose; and Bessie Johnson, blush white. We should prefer them on the seedling Briar preferably to on their own roots, as on the latter they do not succeed well except in very favourable situations, and are more vigorous and floriferous on the seedling Briar. The old Cabbage Rose or Provence may be had of any of the principal nurserymen; also the common or old Moss Rose, which is very handsome, the common Provence or Cabbage Rose being very sweet.

MOVING CURRANTS, &c. (Four-years Subarriber).—You cannot move

MOVING CURRANTS, &c. (Four-years Subscriber).—You cannot move any decidnous trees or shrubs now, you must wait till the leaf falls. Your employer must have been misinformed.

employer must have been misinformed.

GRAPES DECATING (J. Mark).—This is no doubt due to the cold, wet
and sunless weather of the season, the evil effects of which have not in your
case been obviated by sufficient fire heat. The berries bear no trace of
injury from scissors or other instrument. Possibly the agreeable change in
the weather we are now experiencing will produce a corresponding improvement in your Yines.

injury from scissors or other instrument. Possibly the agreeable change in the weather we are now experiencing will produce a corresponding improvement in your Vines.

PEAT (H. R. H.).—There are two distinct kinds of peat, both consisting mainly of vegetable matter more or less decayed. One kind of peat is firm, and contains a natural admixture of sand, the other being more light and mossy in its nature. The former is used for Azaleas, Heaths, and hardwooded plants generally that require soil of this nature, the other being employed for Orchids. Peat and soil of all kinds are advertised in our olumns. In ordering you have only to state whether you require Azalea or Orchid peat, and the right kind will be sent.

SHOW PELARGONIUMS (D. E., Yort).—The present is a very good time for purchasing plants, provided you do not object to have plants that have just ceased blooming, and which are consequently not particularly attractive. It is worth remembering, however, that such plants on being cut down will supply you with some useful cuttings, and you will consequently be able to increase your stock of the varieties sooner than if you deferred the purchase of plants until the spring.

THINKING SEAKALE (A. B. C.).—If the growths are numerous lose no time in thinning them, when those left will form finer crowns and yield much better produce. Four or five fine heads of "Kale" are much more creditable to the grower and astinfactory to the consumer than a dozen that are thin and puny. It is impossible to produce fine heads in spring by any system of management if the growth in summer is permitted to be, as is too often the case, much crowded.

H.EMANTHUS KALBREYERI (Inquirer).—It was named after Mr. W. Kalbereyer, one of Mesery. We deferred the plant in Southerers.

often the case, much crowded.

HEMANTHUS KALBESTERI (Inquirer).—It was named after Mr. W. Kalbreyer, one of Mesers. Veitch's collectors, who discovered the plant in South Africa. This brilliant species is correctly described in Mesers. Veitch's catalogue as producing a splendid flower head fully 8 inches in diameter, and consisting of a somewhat dense and remarkably striking umbel of upwards of a hundred flowers of the brightest vermilion red. The filaments are of the same brilliant colour as the perianth segments, and terminate in small oblong deep vellow anthers.

same brilliant colour as the perianth segments, and terminate in small oblong deep yellow anthers.

Sowing Kidners Brans (A Young Gardener).—Beans sown now can scarcely be expected to produce a crop without protection in the antumn, yet if the winter happens to be deferred in anything like the proportion that the summer has been, the plants may yield a few useful dishes. You should sow them, however, in a position in which they can be sheltered in late autumn. If you can place over them any spare frame lights you will be able to gather several dishes that are certain to be appreciated, because at that time the crops in the open will have ceased bearing, and only the communer kinds of vegetables will be in season.

96

SEA SAND FOR POTTING (R. T.) .- This sand is well suited for plunging SEA BAND FOR POTTING (R. 7.).—Ins sain a well since for plunging the pets in, and we have also known instances where it has been safely and even beneficially employed after being well washed for mixing with soil used in potting various plants. Of course nothing can surpass white silver sand for all ordinary purposes, but where that cannot be readily obtained and sea sand is plentiful we should not hesitate to employ it after adepting the precaution of washing it.

SUMMER-PINCHING FRUIT TREES (J. Wilson).—We not only advise summer pinching, but summer pruning too, when the trees are unduly crowded. In consequence of the absence of fruit in too many instances, and also the absence of frost in spring and sun in summer, fruit trees, like forest trees, have grown with unusual vigour this year, and summer pinching and pruning become the more necessary. Read what "NORTHERN GARDENER" has said on this subject in another column, and when you see his remarks you will probably prune your trees.

CCLOGYNE OCEILLATA (J. B. D.).—This is a dwarf free-flowering Orchid with white sepals 1½ inch in length, the sides of the throat and lip being marked with canary yellow. It is very pretty and quite worthy of being added to your collection.

USEFUL ABUTILONS (Idem).—It is not easy to select what you term "three useful and distinct Abutilons" from so many that are good, but the following will perhaps suit you:—Boule de Neige, white; Boule d'Or, yellow, and Rossefforn, rose; yet distinct from them all and attractive is A. Darwinii tessellatum.

"NATURE DIONEA" (W. R.).—The plant you sent is Drosera rotundi-folia, the common Sundew, and one of the notorious carnivorous plants. It is moderately abundant through the British Islands in marshy and boggy strations. It has some commercial value, as it is grown for sale by the majority of large nurserymen. Of late years there has been a good demand for it, not only on account of its peculiar properties, as the little plant is very pretty when covered with the numerous dewdrop-like exudations from the points of the hairs which clothe the blade and petiole of the leaves.

SEWAGE TANK (J. E.),—You do not require to use anything to fix the ammonia. Water at 50° is capable of absorbing 670 times its volume of ammonia.

TULIP BULB (C. U., Nerwich).—The formation of a bulb on the stem Tulip just above the soil is not unusual. A bulb is an underground bud, and in the specimen you have sent us it has been produced just above the soil instead of beneath it. We cannot account for the cause with certainty, but it may be attributable to the wet season, which has induced inordinate growth in all plants.

STOVE PLANTS FOR HANGING BASKETS (J. D.).—The Æschynanthuses are all fine plants for baskets, Æ. grandiflorus being the best. Agalmyla stamines is also suitable, and Cococypselum discolor, the latter bearing pretty purple berries during winter. The finest of all basket plants for the summer are Achimenes, and for flowering in winter Epiphyllums, the plants being grown in pots and placed in the baskets after the Achimenes are

PIPES FOR HEATING A PIT (H. K. L.).—A 2-inch pipe all round would be sufficient to exclude frost. A larger size of pipe would be better on account of retaining the heat longer, but when highly heated it would give out too much heat, and it will be necessary to have valves on the pipes in the pit to shut off the hot water when not required.

ROOTS OF THE YEW (Richard Fleder).—We do not anticipate any evil results from the roots of the Yew being in the water of the well, but in a case like that the safest and most judicious course would be to have the water analysed by an experienced chemist or analyst.

water analysed by an experienced chemist or analyst.

VARIOUS (Edith).—Water containing scap and soda will improve instead of injure your Myrtle. The green and yellow stains on the verandah can be removed by the application of a strong solution of common sait. According to the daily papers of the 14th inst. a few real Violets were employed at the Prince Imperial's funeral. If this was correct, the fact of flowers being obtainable in the middle of July was no doubt due to the unusually late season, which has prolonged the flowering period.

TEA PLAKTING (J. Green).—We have no knowledge as to the state of the Tea trade in India, and we are sorry we have no opportunity of recommending you to a situation in any of the gardens there.

in the state they are.

NAMES OF PLANTS (Forkshire).—The yellow flower is Hemerocallis flava, the other Lilium Martagon. (Foung Gardener).—1, Spires Aruncus; 2, Nepeta teucrifolia; 3, Hamerocallis flava; 4, H. fulva; 5, Philadelphus vulgaris; 6, Gladiolus communis. (W. D. H.).—Erythree latifolia. (W. W. A.).—1, Viburnum Opulus; 2, Droesra rotundifolia; 3, Cenonyce cocofera. (M. B.).

—The leaf is that of a Megassa, and does not belong to the flower, which is an Ornithogalum of some kind. (Constant Reader).—12, Pinus Lowiana; 18, P. cephalonica; 14 appears to be Quercus glabra; 15, Ables Douglasii; 16, A. Smithiana; 17, is a Juniperus; 18, Populus tremula. (T. S.).—Habenaria bifolia. (W. D. H.).—Santolina incana. (S. A. C.).—1, Chrysanthemum coronarium; 2, Jasminum gractie; 3, specimen not sufficient; 4, Monarda didyma; 5, Lycium europeeum; 6, Cotonesster rigida. (George Murray).—The specimen with large leaves is Magnolia tripetala, the other is Polygonum Sieboldii. (Tosidi).—Pteles trifoliata, North America. (Mac).—The shrub is Rhamnus frangula, and the Eleccharis is multicanils. (M. M.).—Begonia dioloca. (K. T.).—Diplacus glutinosus. (R. F. Wheeler). 1, Sedum carneum. We cannot determine the specific names of the others without flowers.

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

THE ROT, COATHE, OR BANE IN SHEEP.

This disease, according to the majority of both veterinary professors and practical farmers, is in their opinion an affection of the liver, and is commonly called rot; but coathe is the term

used to designate it in Devonshire and Dorset; and hane in Somerset. Formerly, and in the early part of the present century, sheep were more frequently affected by this disease than they have been during the last twenty or thirty years; this is owing in a great measure to the disease and its causes being better understood and provided against by the flock-masters. The lands and pastures, too, upon which sheep are fed have been extensively drained in each of those counties where the animals have been known formerly to suffer most. The testimony of some of the most practical men and largest flock-masters concur in their evidence that autumn is the season when the disease is contracted, and we may point out moist warm weather in autumn, Prevalence of misty rain and heavy night fogs, and rain falling at a high temperature causing a rapid growth of herbage, are generally admitted to be amongst the first causes of the disease; also when the sheep are feeding upon grass the produce of clay lands and boggy lowlands, where the superfluous water cannot easily escape, and more particularly upon pastures receiving the waste and drainage from higher situations, and that have been flooded, the water having subsided and left the stems and roots of the herbage in a moist and sodden state.

We find it recorded that the most fatal years in which rot prevailed were 1809, 1824, and in 1830; and it is stated that although the annual loss from sheep rot had been estimated at one million of fatal cases, yet the loss was more than doubled in each of these years. We can testify, not only from numerous instances which occurred, but from our experience, to the great losses sustained from the rot in 1830, for we purchased one hundred Dorest horned ewes which turned out to be unsound. We sued the breeder for compensation, and we were awarded a sum of money by the arbitrator to requite us for some of the loss which we had sustained from the ewes being unsound; nor was our purchase an isolated case, for large numbers of animals in our district were affected also. No attempt was made to defend the case, as the flock from which our purchase was selected had proved unsound also, nor could anything be alleged against us of the animals having contracted the rot after being in our possession, for they were with the greatest care fed upon sound healthy land and with liberal supplies of nutritions food. As soon as we had reason to believe that the ewes were unsound we resorted to cracked beans as food for them in addition to the customary food of roots and hay; and although the livers of the ewes proved to be infested with the fluke parasites, yet they did not die off as they often do in such cases, but suckled their lambs very well. The lambs made a fair price in the market, but not so with the mothers, for they could not be fattened with the best of food; and although they originally cost 30s. each, which at that time was a full price for good stock of the Dorset horned breed, yet the greatest part of them only made from 18s. to 15s. each when sold in the month of May, after being fed at heavy cost and with great care and attention. We attribute our absence from loss of ewes by death to the circumstance of feeding with beans and other nutritious food. We can also refer to numerous instances in which when the sheep were known to be unsound and contained fluxes in the liver, yet from receiving a generous diet they have been kept alive, and in some cases where the disease had only just commenced been known to fatten and become fit for slaughter.

Our object in noticing this subject at the present time is in consequence of the peculiar season which we have been passing through for some months past, in which heavy flooding rains have prevailed during the spring and summer up to the time at which we are writing. We think it advisable to call the attention of the home farmer to the strong probability of sheep suffering from this disease during the next autumn unless caution is used by adopting all the known methods of prevention. There is, however, no cure of the coathe or bane, because with all the care that we have used or seen recommended for use it can only be pallietive, for when once the flukes have taken possession and established themselves in the animal's liver it is sure to prove fatal sooner or later.

It is of great consequence, too, that the home farmer should

know the fluke when seen in the liver, because when sheep are killed for use at the nobleman's or gentleman's house and it is detected means must be immediately adopted to prevent further injury, and if possible to protect and save any animals which may not be affected. We, therefore, give some illustrations of this parasite known as the liver fluke (Distoma hepaticum), taken from liver, the bile ducts being perfectly filled with them (fig. 11).

The specimens were placed on glass and carefully traced, so that the sizes are strictly preserved, and the anstony—external and in-ternal, as far as it can be seen by the unassisted eye —is faithfully represented. Our second illustration (fig. 12), which has been copied, with a few alterations, from Rymer Jones on "The Animal Kingdom" represents these various parts as they are seen after minute dissections—not in one view as here depicted, but laboriously traced out by the aid of needles and mag-

nifying glasses.

The origin and propagation of the "fluke" is so important that we shall

Fig. 11.—Flukes from the gall-ducts. The ramifications of the digestive tube are seen filled with bile.

here allude to it, and the existence of a large number of living beings within the organisms of other creatures is so commonly recognised that no wonder is expressed or felt at the circumstance; nevertheless the fact is sufficiently remarkable to have

Fig. 12.

Frake dissected; the inferior sucker and one side of the digestive tube removed.

- Mouth, or anterior sucker

wused the attention of physiologists in all times. aulty of explaining the presence of parasites in certain parts of the body has been considered almost insurmountable, and hence the theory of "spontaneous generation" was for a long time a favourite refuge of speculative observers. But the theory is utterly crushed by the weight of the single fact that the entoroa for the most part possess reproductive organs, often developed to an extraordinary degree, as will be noticed in fig. 12 especially. If the parasites were formed from any of the organic particles of the animal they inhabit such organs would be entirely useless, and that they should so exist is contrary to the analogy of Nature. The introduction of the entozoa from without may be fairly assumed in all instances; indeed, the farther the researches of physiologists extend the more decided becomes the conviction that the germs exist exterior to the body of the animal they are hereafter to inhabit. This theoretical view of the subject receives strong confirmation from our practice as flock-masters, and from strong confirmation from our practice as nock-masters, and from the fact that the animals only suffer from the fluke under circumstances which are well known and defined—that is, when they have been feeding upon herbage growing in moist and boggy situations, but more particularly in humid and misty weather. It is fair to infer that it is under these conditions only that the entozoa exist and are perfected, and that they cannot and do not exist upon the pasturage of high and dry soils. Our practical observation and management of sheep, however, enable us to say that although the animals may take the entozoa into the stomach in the act of feeding they will not necessarily breed the flukes in We know that when we have fed our animals on pasturage known as dangerous and unsound for sheep, and which we have done for many years in succession, yet we have entirely escaped from the usual losses consequent upon such feeding by a system of careful management and daily detail of changes of food and pasturage, which we propose to consider and give fully in our next and concluding article.

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour.—This is now greatly required upon the home farm, and has lately, on account of the extremely wet and unseasonable weather, been almost useless, except at unimportant work, for the sake of keeping the horses in health and working condition. As soon as we can get a few fine days the work condition. As soon as we can get a few line days the work should be extended by making longer days and giving extra food to enable them to accomplish what may be required of them—in fact, by making longer days is the only way to make up for the loss of time which now, with some intervals, has extended over three months. A less acreage of mangold than usual has been drilled, and the same may be said of Swedes. The loss of a large breadth of these roots upon the home farm will be severely felt in the next winter and spring, because under certain systems of stocking the home farm the animals must be fed at a greater expense than usual for purchased food, or a large reduction of the stock must be made by sale of some of the animals. There is, however, still time in the southern and eastern counties, and in some of the home counties as they are termed round the metropolic upon the description of the counties. polis, upon the dry soils to drill the Scotch Yellow Hybrid turnips, together with Grey Stone turnips, which to a certain extent will supply the place of Swedes. A fair crop may be obtained should the weather become drier within a few days. At the time we write the land is so wet on the fallows that the horses cannot write the land is so wet on the fallows that the horses cannot enter the fields, the only chance being to plough and sow after the hay crop or some of the fodder crops, such as vetches, and sow the turnips the same day as the land is ploughed. In such a season as we are experiencing this is the only way to drill with a fair prospect of obtaining a crop of roots. We must not, however, forget that the quick-growing varieties of cabbage may still be planted, such as the Enfield Market or Imperial; and the tall rape or colessed may also be sown if required for cutting as fodder for dairy cattle in the early part of winter, or for folding

off with sheep upon the land.

It appears that the harvest of the cereal crops will be delayed so far beyond the usual time that it will be quite speculative as to obtaining good winter food by sowing stubble turnips; but they may, if kept until the spring and allowed to run up into greens, furnish useful food in the month of March, and in the absence of Swedes or mangold it may be worth attention. We have sometimes managed in this way, and have sown mangold seed afterwards. It would not, however, do to sow Swede seed after the wards. It would not, however, no to sow sweds seed and the sore turnips that have been fed off, as they usually die when drilled after turnips, on account of the decaying portions of the roots causing an unhealthy growth of Swedes, and where the land is at all deficient in chalk or lime they will become club-rooted. Should the season continue as at present there will be no healthy growth of roots, the weeds having injured them. In 1860 it was the same -root crops did not flourish first or last during the whole season, —root crops did not nourse here to rest during the whole season, but the mangold suffered more than the Swedes and turnips in that year, owing to the low temperature. We, however, purchased our store sheep and bullocks at a low price in the autumn of that year in consequence.

Hand Labour.—This is unfortunately being done without advantage at present. Hoeing among the mangold and Swede crops does not kill the weeds, and turning the hay does little

beyond exposing it more to the succeeding rains. Very little hay of either arable or pasture produce has been stacked up to the time we are writing. Much has been entirely spoiled as fodder, should the weather eventually prove ever so fine for stacking it. Dairy cows have been doing badly where they have not received supplementary food, such as vetches, clover, or border grass, as the meadow land is in many instances so trodden by the stock as to make the food very unpalatable. In other cases, even on the best vale grass land in various counties, the fatting bullocks or sheep have not made the progress that could be desired or that they usually do, although they may have received a fair allowance of oil cake, the grass being watery and deficient in nutrition. The yearling off heifers intended for the dairy should now have a well-bred yearling off bull to run with them until the end of August,

or until they have all been served; they will then drop their calves at the best time of year, about the end of April or early part of May. They should, however, be taken to high and dry part of May. They should, however, be taken to high and dry pastures for lying at night if possible, or otherwise they should have some oil cake or cracked beans to keep them healthy in such an untoward season as is now prevailing. The ewes, too, will now require attention. The horned ewes kept for stock or for breeding early lambs will have now nearly all offered to the ram, and will bring their lambs in good time. The down ewes, too, where they are required to lamb early, should have the rams turned in with them directly if the lambs should be required for the Easter markets. To breed these early lambs the Dorset and Somerset downs answer the best purpose, for many of these flocks originally came as a cross from the horned stock of these counties, and this circumstance is much in favour of their offering early to the ram. circumstance is much in favour of their offering early to the ram, and more so than the Hampshire downs, whether reared in Hants, Wilts, or Berks, and the same must be said of the Sussex downs,

THE HIGH PRICE OF MEAT AND ITS REMEDY.

CONSUMERS of meat on the one hand complain of high prices while producers on the other are deploring the low value of their animals as obtained in the markets. Both these sections complain justly, for both suffer, those who benefit being the salesmen and middlemen. On this question, which is an important one, we have justly, for both suffer, those who benefit being the salesmen and middlemen. On this question, which is an important one, we have received a letter from Mr. Peter Naylor of Basingstoke, which has been published in the Agricultural Gazette, and from which we cite the following:—"The high price at which meat has been sold for a long time past has been no compensation to farmers for the low prices of other produce. They have been robbed of their profit by middlemen, while the high prices obtainable here have attracted the foreigner to our markets. It is too late now to stop the influx of American meat. An enormous increase may be expected from the steps already taken in that direction. English farmers might distance connections in the superior quality of farmers might distance competitors in the superior quality of their meat; but, to their shame be it said, English butchers are found to aid the foreigner, not by placing their meat side by side in fair competition, and selling each at market value, but by passing off American meat as British at the highest price.

"What is the remedy for this state of things? My answer is, that British graviers must 'take the bull by the horns,' and wrench the horne meet trud from the horne of three new incoversion of

the home meat trade from the hands of those now in possession of it. Let them abolish the butchers, and with them the dealers in fat stock. Let the law of supply and demand alone regulate the price of meat in future, free from the 'operations' of the middle-

"Nothing less than a complete revolution in the home meat trade should be aimed at. Notwithstanding the opposition to be expected from various quarters interested in the maintenance of expected from various quarters interested in the maintenance of things as they are, a sound opinion is current that this can be done if landowners and tenant farmers will individually and collectively act with promptness and decision. Whatever may be said to the contrary, the interests of producers and consumers are in the long run identical, and in none more so than on this meat question. The co-operation of the consumers may be relied on, for at present their prejudices are strongly in favour of the home article, but the initiative rests with the agriculturists, whose special care it should be that the home meat trade is not manipulated to their own disadvantage.

POULTRY FARMING.—No. 4.

POULTRY FARMING.—No. 4.

The next subject to be considered for the keeping and breeding of poultry on a large scale is the distribution of the stock over the ground and its housing. Both of these points are of the utmost importance, for if the former be neglected the birds will infallibly have epidemics from tainted soil, if the latter from vitiated air. However large be the area over which the stock is spread it must be separated. All experience proves that fowls will not thrive if congregated together in large numbers, and unless proper barriers are made it is impossible to keep different flocks apart. When they are young and during the summer months, especially if there be plenty of wood and the various houses are not visible from each other, different lots will live separately and keep to themselves each in the house allotted to them, and over the ground about it; but directly the leaves fall and autumn weather arrives about it; but directly the leaves fall and autumn weather arrives about it; but directly the leaves fall and autumn weather arrives they become gregarious and all huddle into one or two abodes, probably those nearest the habitation of their attendant. In the day, too, they bask about in immense flocks and taint particular pieces of land. For this reason they must be duly separated. Of course, some amateurs may have so many broad acres of park or forest land that each lot of their fowls can be placed at really considerable distance from all others. Even then there is danger of their getting together in winter, for they will then follow the sound of crowing long distances. We are not, however, now writing for rich amateurs, but for those whose object is profit from their birds, and with whom economy of time and trouble is a point, for much time is taken up in travelling round to distant

To begin with, we should divide the ground into runs of about

an acre; these should be divided with fences 6 feet high, and closed at least 2 feet from the ground. This is requisite for two reasons—firstly, because through a wire or lattice fence cocks, and reasons—firstly, because through a wire or lattice fence cocks, and sometimes even hens, will fight and injure themselves and others; and secondly, because birds are much more contented it they cannot see beyond their runs. If confined merely by open wirework so that they can see tempting surroundings, more especially if they can see their neighbours more free than themselves, they continually tramp up and down in a way which reminds us of the Polar bear in the Regent's Park.

There are various ways in which the fencing may be made. We have seen it of wattle hurdles 8 feet high, the poles between them being 6 feet high, to which light wire-netting was attached above the hurdling. We do not consider this at all a satisfactory barrier; for to begin with, the wattles must be double, spart at the bottom, and leaning against each other towards the top, or they will be useless for preventing fights, and, moreover, they very soon wear out. Where there is every chance of the runs being long re-quired we should make the divisions of rough deal 2 or 8 feet quired we should make the divisions of rough deal 2 of 8 feet high, and the upper part of light wire netting at about 4d. a yard, 3 feet wide. Where, however, there is any intention of moving the divisions frequently we would make them of 6 feet wire, fastened to fir poles at from 6 to 8 feet apart, and tie against the lower 2 feet of the wire heath, rushes, straw, or coarse sacking. Such a fence may even serve as a permanent one if a laurel hedge be thickly planted on each side and well trimmed as it grows. In three or four years it will become a sufficiently close barrier as the temporary screen wears out. We have seen in a French book minute instructions for making a permanent living fence which we will translate:—"The partitions should be 2 yards high. To construct them in this way get some freshly pruned boughs of poplar, willow, or any other tree which grows from slips. Mark out the runs by making trenches 9 inches deep wherein to plant the bottom of the fence, and in these dig holes at all the anglest of the yards at least 18 inches deep for the corner stakes, which should be 2½ yards high—i.e., 2 yards out of the ground and 18 inches in it. These corner stakes should be cut from the stoutest branches, and should be at least the size of an arm. At intervals of a yard all along the trenches holes must be made to receive somewhat slighter stakes. To begin with, put in the corner stakes and ram down the earth round them, then with the poles of the middle and smaller size make a trellis. This when poies of the middle and smaller size make a trellis. Into when the trenches have been filled-up with earth, and when some horizontal bands of water willows have been again twisted in it, becomes quite impenetrable. About four of these cross bands are required to make it quite firm. If all the wood have been planted from both but it bracks out in surjust time and former an imperiability. fresh cut it breaks out in spring time, and forms an imperishable fence which ever becomes thicker. It should then be clipped every year, as it grows too tall or straggling. To ensure success all must be planted very freshly cut and before it hardens. Perhaps the best time for it is the month of March." We do not pretend to have tried this kind of fence, but the directions for making it sound practical, and we can fancy that in many places making it sound practical, and we can rancy that it many passes it might be constructed at a small cost. In whatever way the runs be divided out we should make them as we have said, of about an acre each. The number of fowls that may be allotted to each depends upon circumstances, such as their age and size, into which question we will go under the heading of "General Management." Management.

The next point to be considered is the housing of the birds. For the number which we shall advise to be kept in each enclosure a house will suffice 12 feet long by 8 feet wide, with a span roof, the ridge 10 feet high, the caves 6 feet. We do not closure a house will sumce 12 feet long by 8 feet wide, who span roof, the ridge 10 feet high, the eaves 6 feet. We do not attempt to give minute directions for the construction of houses, for we have not even had them made with strict regard to economy, which is of course necessary where profit is the aim of the establishment. Much must depend on the locality and the materials there cheapest. Of course if any of the runs are bounded by a wall on one side expense is saved by making the house lean-to, in wall on one side expense is saved by making the house lean-to, in which case they might well be narrower and proportionstely longer. Where peaty soil abounds huts may be cheaply made of it; they should have an opening to the south never closed, for the ordinary methods of ventilation are not easy. Ventilation should be the first care in the construction of houses. The perches should be low, and at a level above them on all sides of the houses save the north should may wentilated of the perchase. the houses save the north should run ventilators of wire netting near to the eaves. So much harm is done by foul air that were near to the eaves. So much harm is done by foul air that were we ourselves about to attempt keeping poultry in large numbers we should be inclined to have sheds for roosting instead of houses—i.e., houses with three sides, but entirely open towards the south; at any rate, all through the summer we should have the doors left open all night. For roofing we prefer thatch as warmest in winter and coolest in summer; it may be well made with heath in lieu of straw where it abounds. In addition to the roosting house there should in every run be a smaller rough shed, such as will afford a dusty dry piece of ground all the year round such as will afford a dusty dry piece of ground all the year round and shelter during storms; for fowls always seem to have an objection to taking refuge in their roosting houses, probably because the floors are generally harder and more level than they like, and the retreat is too dark. In a concluding article we

hope to give our idea as to the breeds most suited for the various requirements of a large establishment, and as to general management.—C.

VARIETIES.

ALTHOUGH a vast quantity of hay and fodder have been wholly ruined by the late drenching rains, yet a valuable residue was comparatively uninjured when the brighter days set in, and much has since been secured. The ground, however, being cold and wet the grass, &c., withers slowly, and the work of haymaking even now the rain has ceased is somewhat tedious and expensive. The meadows, too, have been considerably weakened in consequence of the cutting having been so long deferred, as nothing is so-exhaustive to plants of all kinds, including the grasses, as the strain they sustain by the formation and ripening of seeds, and more than the usual dressings of manures and fertilisers will probably be necessary for maintaining the meadows in what farmers term good heart and condition.

WE have received the prize list of the Hemel Hempstead Poultry and Pigeon Show (October 1st and 2nd) together with the rules and regulations for the incubator tournament, the chief prize being a gold medal value ten guineas. Entries for the poultry show close on September 13th, and for the incubator contest on August 23rd. Rules, &c., can be obtained from the Rev. Herbert R. Peel, Abbot's Hill, Hemel Hempstead.

ANOTHER new weather theory has been promulgated. An observer who has closely studied the weather for twenty-An observer who has closely structed the weather for twenty-seven years states that there are successive triennial periods of dry and wet weather. The summers of 1871, 1872, and 1873 are pointed out as wet; 1874, 1875, and 1876 as dry; and 1877, 1878, and 1879 as wet again, so that the next dry period is due in 1880. What may be termed the antipodean theory—(namely, that the character of the seasons at the antipodes is reproduced in England in the summers succeeding) has utterly broken down; for while last summer in New Zealand was one of the hottest and driest on record, this summer in England is the wettest and coldest that has been known for many years.

BRITISH BEE-KEEPERS' ASSOCIATION'S ANNUAL EXHIBITION AT SOUTH KENSINGTON.

SECOND NOTICE.

To those who are looking forward hopefully to the day when the moveable-comb principle may be generally adopted by the cottager, Class 3 is much more interesting than that last commented upon, since here, instead of finding costly hives as much beyond the comprehension as the pocket of the labouring classes, the price is limited to 10s. 6d., including cover, floor board, and facilities for storing surplus honey, while the exhibitor must be repared to guarantee to supply any number of hives like to exhibit and at the price affixed. The Judges awarded first to Messrs. Green & Son for the "Cottagers' Myrtle Hive." This carries sectional supers, and the adapter is both good in arrangement and make. Mr. R. Steele took second honours. Here the secment and make. Mr. R. Steele took second nonours. Here the sections can be placed laterally. Mr. Holland stood third with a hive both good and cheap; as was also that of Mr. C. T. Abbott, highly commended, while his brother's, though well supered, is too small. Mr. R. McGregor shows a doubled-walled hive with capital weather-boarded super cover. The workmanship and materials are alike good; and without the paint, of which three coats at least seem to have been given, would be a marvel of cheapness. Bearing in mind the guarantee previously referred to we should have placed this hive in the prize list. Mr. Lyon in this class showed a hive worthy of attention bearing this inscription—"Cheap bar-framed hive for cottagers' use, made with no tools but a pocket knife and kammer. Honey may be taken from the frames farthest from the hammer. Honey may be taken from the frames farmest from the entrance, or supers may be worked on the top, the roof being deep enough for them. Cost: one lobster box, 4d.; one milk box, 3d.; sheet iron, 30 inches by 24 inches, 6d.; 5 feet pine for frames, 5d.; total, 1s. 6d." The frames, twelve in number, are placed in the lobster box (which is 18 inches long, 12 inches wide, and 9 inches deep) with their ears extended over its upper edge; the milk box is inverted over these to hold the sections or supers. should such be used; the iron sheet goes over all to keep weathertight. The boxes aforesaid are seasoned and very strongly made, and would be good after use and exposure that would reduce many of the so-called cheap hives of some makers to utter wreck.

many of the so-called cheap hives of some makers to utter wreck. The hint can only be taken advantage of by those who have some little mechanical tact, but to such it is, we think, of great value. Class 4, for best straw hive for depriving purposes, cost not to exceed by. Messrs. G. Neighbour deservedly won with a good tightly-made skep, having two holes in crown, upon which is placed a crate of sections, itself having a new and neat method of fixing its boxes. Upon the hive three slats are fastened; between two of these and against the third the crate is slidden, when it stands in correct position over the holes in the hive crown. The common skeps shown by Mr. Griffin are beautifully made and

very cheap.

Class 5 (supers) contained no novelty worthy of remark, while chass 5 (supers) contained no noverty working or remain, while almost all are but feeble copies of American patterns; and in the crates, although dummies were shown by some, nothing worthy of comparison with parallel wedges appeared. Messrs. Steele, Baldwin, and Neighbour stood first, second, and third; Mr.

Holland highly commended.

Class 6 (Ligurians) were only a good average, Mr. Abbott and
Messrs. Neighbour & Son, first and second, were the only exhibitors. Messrs. Neighbour & Son, first and second, were the only exhibitors. Class 7 (foreign bees, not Italian), Messrs. Neighbour first and Mr. J. P. Jackson second, with Cyprian bees, by far the most noteworthy in the Exhibition. They are of good size and wonderfully handsome, the yellow being bright and solid. The mesanotum and metanotum are respectively partially and completely yellow, as are also four of the abdominal rings; legs deep jetty black, pubescence light and sharply defined, with the abdomen yellow beneath. We are informed by the exhibitor that these bees are of extremely mild temper. Class 8 (pure Hnglish bees), three exhibits; first Messrs. Neighbour, second Mr. S. Baldwin. A patient search with a hand magnifier was not rewarded by finding a single pure black bee in the collection. The advantage of this class is not very apparent. The English honey classes, eleven in number, now invite attention; but unhappily the catalogue contained many entries, which made in hope had been abandoned in despair, and vacancies upon the hope had been abandoned in despair, and vacancies upon the tables were rather the rule than the exception. Results surprising for the season in a few cases were shown, Mr. S. Thorne

prising for the season in a few cases were shown, Mr. S. Thorne taking first with 40 lbs, from one stock, and coming also to the front with sections of good quality and regular surface. The Italian honey exhibited was bad in colour and indifferently shown. One side of the quadrant devoted to the Exhibition was in large part occupied by the collection of apicultural appliances of Messrs. Abbott first, Neighbour second, and Rusbridge, the last being also least in quantity but admirable in weeklevaking. being also least in quantity but admirable in workmanship. In extractors, Class 24, Mr. Cowan, first, shows a very ingenious improvement, which automatically reverses the combs after one side has been cleared of honey. This is one of the bright ideas of the season which marks a step in the development of the extractor, the season which marks a step in the development of the extractor, and will soon appear, we think, in some of the big apiaries across the ocean. Messrs. Everett of Ohio, U.S., came second with a very highly decorated machine, and Mr. Cowan third (he has always been strong in extractors) with a crank rod movement extremely simple and effective. In Class 25, for the finest sample of pure beeswax, we think it unfortunate that a prize should have fallen to specimens publicly known not to have been produced by the exhibitors' own bees. Does not the letter of the schedule here require emendation? In Class 26, for any new invention calculated in the opinion of the Judges to advance the culture of bees, two commendations only were given, one to the copper bees, two commendations only were given, one to the copper bottle for heating supers, which we regard on more grounds than one as worse than useless, and the other to Mr. Cowan's ventione as worse than useless, and the other to Mr. Cowan's rentilating frame for wintering bees, which, however good, is too scientifically conceived to commend itself to the average beekeeper. Mr. J. Hunter, jun., exhibited alone in Class 27, but deservedly was awarded silver medal for his ninety microscopic slides illustrating the anatomy of the honey bee.

In the display of British bee flora Miss Ellen Rorke took first

prize with a neatly exhibited collection of dried blooms, all excellently displayed; Mr. R. B. Godfrey stood second, closely pressing the winner; Mr. Whealler third with a good collection in a fresh state.

Class 30, for the best smoker, Mr. R. Steele won with novices; but we think Messrs. Neighbours' and Mr. A. J. King's exhibits were both greatly its superior. In Class 32 Mr. F. Cheshire was awarded silver medal for a beautiful series of large drawings, having an area of 150 feet, which he had executed mostly under the microscope; Mr. R. R. Godfrey commended.

The members of the Committee gave instruction in the bee tent during the manipulations; while Mr. Newman of Chicago, Editor of the American "Bee-keepers' Magazine," and who is now in England as a delegated representative of the Bee Associations of America, addressed a good gathering on the aspects of bee culture among our transatlantic cousins. Bishop Tozer presided in the absence of the Baroness Burdett Coutts at the annual general meeting, and threw out some good suggestions in reference to the distribution of cheap tractates amongst the poorer villagers to the distribution of cheap tractates amongst the poorer villagers where bees are or might be kept. Upon this point, and the means for assisting the producer in disposing of his honey, an animated and friendly discussion followed. On Thursday the Countess Brownlow distributed with much grace and geniality the prizes in medals, certificates, and money, all of which had been either duly engraved, written, or packeted by the hour appointed. The proceedings were terminated by an enthusiastic vote of thanks to the most excellent Hon. Sec., Rev. H. R. Peel, and to the Baroness for her kindness in presiding. Baroness for her kindness in presiding.

SWARMING VERSUS NON-SWARMING.

THERE can be no doubt that to permit a moderate amount of swarming is good management for bees. In my own case I a ways like to get one good swarm per annum out of each of my

hives; and of late years, being generally at home at swarming time, I prefer to let them go off in the natural way. I consider a natural swarm one of the special interests and delights of spring time, which I would not forego on any account. Moreover, Nature is the best guide where she can have her way in her own proper time, and it has been often observed that there is a greater spirit and diligence among bees after swarming than at any other time. Nevertheless, there are many persons who keep bees at a great disadvantage owing to necessary absence from home, or such fulness of occupation as must needs prevent them from watching their bees with sufficient closeness of attention. Hence watching their bees with sumcient closeness of attention. Tence they lose many swarms every year, and fail to obtain the honey harvests which they might reasonably expect, great disappointment being oftentimes the only harvest which they do reap. Therefore it is a perpetually recurring question, "How may such persons best manage their bees so as to risk the least possible loss of swarms and to gain the utmost harvest of honey?"

There seems but one of two things to choose for this endnamely, either to prevent swarming altogether so far as is possible, or to make the bees swarm by artificial means at suitable times, limiting the swarms to one from each pair of hives. The latter can usually be done even in the case of straw skeps by driving a swarm out of any strong stock and putting it at once in the other stock's place. If this be done under favourable circumstances (including fulness of population and suitable weather) but few bees will be left in the old stock. When denuded of its population to the utmost the old stock should be made to take the place of another strong stock at a time of day when most of the bees are abroad, which latter must be shifted to a new stand the bees are abroad, which latter must be shifted to a new stand as far off as may be. It is evident that the driven stock will have to raise a new queen, and in the course of a fortnight there will be a probability of a second swarm. As soon as strong piping is heard by two or three of the young queens this too should be driven and put in place of the parent stock after getting rid, as in the former case, of the entire adult population. This twice-driven hire, with its stock of young queens in various stages of development, of which there are sure to be several left, is now in a position to be utilised with good effect. For repeating the process above detailed it will be in a most favourable condition to receive the outlying or home-streaming population of any other strong stock which may be shifted from its place, supposing there to be more hives in the apiary out of which swarms are to be driven as before described. It is true there is a chance of a cast issuing when the young queens come to maturity; but the pro-babilities are against it, because in this case the bees will have been in too disturbed a state to be very watchful over the first young queen that issues from her cell, who will in nine cases out of ten "polish off" her rivals before she is interfered with. Any or ten poiss on ner avais before she is interfered with. Any intelligent bee-keeper who carefully studies the foregoing instructions will be in a position to manage his apiary with the least possible risk of losing his swarms. When swarms are thus made let them be placed in roomy hives, and ekes and supers given ad libitum, with free and easy access from the stock in each case to both super and eke. Then the bee-keeper can go about his business without undue anxiety.

In the case of bar-framed bives the thing is still easier. All

In the case of bar-framed hives the thing is still easier. that is required is to take out the queen on some convenient day with one or more bar-frames of brood comb, putting them into a new similar hive, which is also to be placed where the old stock stood, removing this to another stance. Here the parent hive alone is disturbed. Of course as before a "cast" must be expected, but it will reduce the chance of such issue to a minimum if the frames be examined in due time after strong piping has been heard, and all royal cells be cut away, leaving but one closed or fully matured cell as a guard against accident. After removing the full combs of brood let empty bar-frames be substituted in their place with workers guide comb or wax-comb foundation

attached.

To prevent swarming altogether is perhaps an impossibility. In years like the present, or in ordinary rainy seasons, bees will swarm even from partially filled hives, so that the risk of losing a swarm must always remain in the category of chances; still it a swarm must always remain in the category of chances; still it can be reduced to the least possible point, and in many years the use of proper precautions will generally succeed in averting swarming. There is of course one treatment which may be expected absolutely to succeed in preventing the issue of a swarm other than that which may be called a "hunger swarm." It is simply to examine a hive week by week, and to cut out every royal cell which may happen to contain royal brood. This, however, cannot always be done, nor without serious inconvenience in cases where supers have been set upon a hive, although up to in cases where supers have been set upon a live, atthough up to such time this suggestion should not be neglected; it will therefore be advisable to adopt other methods to baffle the bees instinct. Such methods will include the supply of abundant room as soon as the great honey harvest is commencing—1, by means of nadirs, ekes, and supers, or by lateral expansion of the hive; 2, by removing frames and supers when full of honey, and substituting other empty ones as fast as required.

But besides these obvious methods with which every practised hear heaver is familiar. I would suggest a third as follows, which

bee-keeper is familiar, I would suggest a third as follows, which

has well answered in our apiary. It combines both methods just described. Before royal cells are set, or if set after extracting them all, transfer to large supers three or four alternate frames of brood, replacing them with frames containing guide-comb or full-sized foundation comb. Similar combs can also be placed or full-sized foundation comb. Similar combs can also be placed in the supers. The honey stored in the transferred combs after the brood has been hatched out will be as good as any for extraction by the slinger, otherwise these combs may be used for the strengthening of the parent stock at the close of the season by replacement, or of any other which may require food. By this means not only will the increased space in the parent stock, and the stimulus given to fresh comb-making with the high sides of the bear attention from quent reging but the the hive, divert the bees' attention from queen-rearing, but the certain occupation of the super by a large detachment of workers will both relieve the overcrowd below and induce the bees to take immediate and permanent possession of the super, all which circumstances will certainly tend greatly to postpone size die any idea the bees may have formed of swarming. The process obviously enough can be repeated with a little variation more than once in the course of the summer.—B. & W.

OUR LETTER BOX.

TALKING PARROTS (P. Clutterbuck).—Grey Parrots of both sexes talk freely. One of the best talking birds we ever heard was a hen, the sex of which we can vouch for from the fact of it having laid many eggs during captivity. The bird belonged to the proprietor of a china warehouse in the midland counties.

APIARY .- 1, From the centre of one bar to the centre of the next should APIARY.—1, From the centre of one bar to the centre of the next should be 1½ inch in the stock hive. It is usual to allow a trifle more, say from a ½-inch to ½-inch in the supers; but bees are very capricious in the distance they adopt in supers. 2, By all means cut away all empty droscomb in transferring bees and comb from a straw hive. There will be added quite enough of this by the bees in filling in vacancies. 3, The "black bees" are found in many hives, and are not distinct in kind. They are probably old bees, which have escaped the perils of many a forage and have worn away their hairs. 4, Mignomette and borage might bloom before late autumn closes and yield some feed, but we doubt the utility of sowing it so late as this. Nor indeed do we, not being market gardener or seed growers, trouble ourselves to supply pabulum for our bees, which cannot be supplied by amateurs in sufficient quantities to pay. 5, There is no objection to the perforated zinc as used ordinarily when feeding.

From observations taken near London during forty-three years, the average day temperature of the week is 74.9°; and its night temperature 50.4°.

CULTURE OF ALLAMANDAS.

HESE plants are flowering exceptionally well considering the sunless season, although the growths are somewhat longer than usual before the flowers appear. If the stove temperature had been kept to its average height through the two or three months past, with scarcely any air, the growth would have been long and weak, with no substance to produce first-rate flowers. However, these conditions having been modified to suit the season, plants generally are doing well. While they endure a large amount of sunshine, they are much benefited when in flower by a slight shade during the hottest part of the

Allamandas are not only ornamental but useful for a variety of purposes, either grown as climbers up the roof of a stove, or for the decoration of the conservatory during the latter part of the summer. For the purposes named the plants produce a fine effect when well grown, and to accomplish this end they should be treated liberally. These plants are of strong growth and delight in heat and moisture, especially if the blooming period is to last over a long space of time. Allamandas are capable of producing flowers of large size and substance for eight months out of the twelve; they are easy to grow, and do not require so long a season of rest as many people suppose, and give them. Seven or eight weeks' rest is sufficient for them from the time water is first withheld. Neither is bottom heat necessary in any stage. They succeed well either in pots or planted out. We would recommend large pots in preference to planting-out, as water can then be given and withheld at will, and the soil partially removed and renewed at the proper season.

Propagation is effected by means of cuttings from the young shoots taken off close to the wood of the previous year; they should be inserted in small pots singly and placed in a Melon house, and must be shaded from the sun. They are not particular as to soil in this early stage. We employ light turfy loam with a dash of sand in the centre of the pot for the base of the cuttings to rest on. They neither need bellglasses nor propagating frames, and are in no way particular about bottom heat. We may here say that the lovely species A. grandiflora is best managed by being grafted on any of the stronger species, such as Schottii or Wardleyana. In grafting it is important that the wood be ripe, both of the stock and the spray that is to be employed for the scion. They can be inarched similarly to Vines by placing the two portions of the young wood together. We consider the first-named system to be the best. In performing the operation, supposing the stock is in a 3 or 4-inch pot it should be shortened well back to within 3 or 4 inches of the soil; any of the ordinary modes of grafting employed for Roses, young fruit trees, &c., will answer well. The piece employed for the scion should contain two or three buds, and after carefully fitting the two together they must be made secure with worsted, where the union is to take place and he then well rubbed.

No. 9:8.-Vol. XXXVII., NEW SERIES.

over with clay or grafting wax. This being done they must be placed in the propagating frame, where they can be carefully attended to until growth has commenced and the union is complete. When root-action is becoming vigorous they should be transferred into larger pots. This species grows much slower than any of the others, but its flowers

are produced very freely.

Allamanda nobilis, A. Schottii, and the old A. cathartica are all worth growing where a collection is the object. A. grandiflora and A. Wardleyana are the two most worthy of a place of any with which we are acquainted. We should certainly recommend that beautiful hybrid of Mr. Wardle's, which is named after him Wardleyana, and very frequently seen under the name of "Hendersonii." It will produce nearly double the number of flowers that A. Schottii will; the flowers are as large or larger in size with as much substance. and the brown markings are more prominent in the throat or tube than in its parent Schottii, while it possesses the light markings of its other parent cathartica. The treatment that applies to one species or variety will suit the others equally well, except grandiflora, which requires more careful cultivation. Allamanda Wardleyana is our favourite; it needs no special care in propagating, except that it is best attended to as early in the season as possible. This is important, and the young plants must be grown on rapidly. We might here say that the Allamanda can be grown too strongly and rebustly the first or second season; if this is the case the cultivator may not save time. To guard against this the wood must have light, sunshine, and air when developing its growth rapidly to solidify the wood. Another important item is that very firm potting is required. This is not quite so necessary in the very earliest stages, but the last potting in the first season should be firm; the plant will then rest, and when cut back and again started in January or February it will grow freely. On the other hand, if not firm and ripe when pruned it often dies back.

The young plants when well rooted in 3-inch pots must be transferred into 6-inch pots, using this time loam, sand, a seventh of manure, and a little leaf soil, which will assist them to start freely into growth. After this potting the compost we find most suitable is rich fibry loam, a seventh of manure, and sufficient coarse sand to make the whole porous. The young plants will extend rapidly, and can be shifted into 12-inch pots the first season. The system above is the best when the cuttings are struck late; if rooted early, as advised, the leading shoot when about 1 foot in length should have the point taken out and two shoots allowed to grow instead of one. No better place to train them can be found than under the roof of a stove, in an upright position. By the end of the season the two shoots will be strong; they should be well ripened and receive a good rest. Our mode of resting is to withbold water when the wood is ripe until the foliage flags. Very little water is given afterwards, only sufficient to keep the wood plump.

Whether intended to be trained and employed as a stove

the two together they must be made secure with worsted, where the union is to take place and be then well rubbed removed from the roof a short time before the plants are

NO. 1610.—VOL. LXII., OLD SERIES.

required for exhibition and be placed upon a trellis. The cultivator in pruning must be guided by the condition of the wood and the distance the shoots can be laid to the right and left of the pot. If thoroughly matured a yard on each side can be left. The ball of the plant if very dry should be partially shaken out and steeped in tepid water. After being thoroughly soaked and the water well drained from the soil the plant can be placed in a pot either the same size or larger, the latter will be the best, using the compost recommended, and the soil must be rammed firmly into the pot.

Allamandas can be potted as soon as pruned back, but we prefer leaving them a time to rest after the final pruning. No attempt is made to wait until the plant breaks into growth before the operation is carried out. We have tried both plans and find little or no difference. Very little water is needed at the root until root-action and leaf growth have well commenced. If the wood at the pruning time was well ripened bloom will be produced when the young shoots are about 18 inches in length. The second season a good quantity of bloom will be produced. The plants will continue branching and flowering until late in the season, when rest to a large extent has to be forced on them. With two batches of plants, one started early and the other late, Allamanda blooms may be had all the

If desirable to extend the plant two shoots, one on either side should again be left at pruning time a yard or more long and trained horizontally as before, the other shoots should be pruned back to one or two eyes like Vines on the spur system. Plants can in this way be extended until they fill the whole side of a house. The syringe is sometimes necessary if the small yellow thrips makes its appearance in the points of the shoots, which if allowed to remain soon does much damage. Nothing is better than the syringe to keep down this insect, it does not like water. With plenty of moisture in the atmosphere and the plants growing rapidly there is little fear of its attacks. In our mode of treatment the syringe is seldom used-never after the first flowers make their appearance.

The Allamanda while growing requires liberal applications of water, and is much benefited with liquid manure when the pots are full of roots. It is something wonderful what a large amount of growth the plants can support with limited root room, provided they are liberally supplied with water and their wants attended to in other respects.

We strongly condemn that constant growing and non-pruning system that we occasionally meet with. Under this weakening and exhausting system what size and substance have the flowers? and in what quantity are they produced in comparison with those that rest and produce their large flowers of great substance in due season?—Wm. BARDNEY.

[We have seen the plants grown by Mr. Bardney, and never saw any blooming more freely nor producing finer flowers. —E⊅s.Ť

VINES—FERMENTING MATERIALS.

THE winter of 1878 and 1879 will long be remembered by gardeners practising early forcing. Prolonged cold sunless weather through spring to the present time seriously retarded forcing operations. Vines started in November did not break until January, or else grew very tardily and weakly. There are those who surmise that a severe winter is certain to be followed by hot weather and bountiful harvests of fruit and grain; but this is not a rule, and we find that the would-be weatherwise folks are silent if the results are contrary to the predictions, for we have evidence that a severe winter may be followed by a cold sunless spring and summer.

Some insist that fermenting materials are of no value on outside borders, as the heat generated does not pass downwards but upwards, and is of no use in warming the soil. If any evidence were needed to controvert these statements we can have none stronger than that afforded by the roots of the Vines, as in removing the fermenting material the roots will be found growing actively in it, thus showing that they have been attracted upwards. Those who advocate the non-covering of Vine borders with fermenting material foresee no frost, cold rains, and snow, which affect the roots so injuriously in unprotected borders. Stored-up sap in thoroughly ripened wood will sustain growth until the roots are in action, but how are they to be active in a border at a temperature of 40° whilst

the bunches develope, the set will be good, the swelling free, and the finish perfect! It may be as well to state that no growth takes place in the Vine at a lower mean temperature than 50°, at which after a good rest both roots and head become active, so that in mild winters a covering of some dry pro-tective material if applied before the border is drenched with rain is sufficient to retain heat at a temperature exceeding 50° We may safely conclude that activity of buds and roots is simultaneous.

We may insert a Vine cutting or eye in moist soil, and if it be placed in bottom heat with the atmosphere too cold for leaf-development yet roots will be emitted; or coil a piece of Vine stem in a pot, and simultaneously with leaf-growth roots will be emitted if both soil and air are the same temperature. The stored-up sap in thoroughly ripened wood supports both leaf and root growth. It is the same in all cases whether of the herbaceous plant, bulb, or ligneous plant—thoroughly ripened growth is the foundation of vigorous growth. In lifting Vines that have been planted a number of years the roots are often found to be fibreless and unhealthy, but if they are replanted nearer the surface in fresh compost they will start freely, and by the stimulation of fermenting materials placed on the border the Vines become furnished with active roots in such quantity as to sustain a vigorous growth. Keep a Strawberry plant dry at the roots when at rest, and it will not force nearly so well as one kept cool and moist. A Peach border kept dry in winter will cause the trees to cast the buds, and a Vine border allowed to become dry will assuredly destroy every The tender rootlets also perish in a cold wet young root. border, and the break in either case is irregular—the growth slow and weak, especially if the roots are in a cold outside border and are not stimulated into activity by warmth from some source. I do not insist on bottom heat being necessary for Vines, but I do submit that in the early forcing of any plant it is a highly advantageous aid, inasmuch as it induces root-action proportionate to the leaf-growth. I can well remember when Vines, as a rule, were grown with the roots exclusively in outside borders, not one Vine in a hundred being planted inside. There were Vines in almost every pinery, the Vines being started in a minimum temperature of 60° to 60° the borders in every instance being thickly protected with litter. It was common in those days to have Vines trained to the roof of a house with the roots outside and Peach trees beneath the Vines in the house, the latter having the roots inside, and not unfrequently Fig trees were planted against the back wall. It is only fair to state that good useful fruit was so grown, and many plants as well. Bottom heat was employed then as now for most plants required early, though Pines were said to be grown successfully by Mills without bottom heat, which appears to have been only transitory, as no one would think of growing Pines without bottom heat of some kind any more than they would have thought of starting Vines in January without first placing on the border a good thickness of fermenting materials. Next came the fancy for inside borders with arched front walls to allow the roots to pass into the outside border, the Vines being planted inside; and in this case it is notorious that the roots are more plentiful in the outer than the inner border; they choose the cold and wet preferably to the warm and dry-remarkable fact. The fact is, inside borders serve no practical end unless kept thoroughly moist, especially when the Vines are in free growth and in search of moisture, the roots pass through the arches. The case is similar to the rods of Vines deep in outside borders, the insufficient supply of water near the surface causing them to descend in quest of it.

It may further be urged that chambered borders with hotwater pipes for affording bottom heat prove conclusively by their failure that applying heat to the roots of Vines is injurious. I admit they have few advocates and fewer adopters; indeed I know of more than one instance where the heat is not employed with results much more satisfactory than when the borders were kept warmed by the hot-water-pipes, yet in no instance were the borders protected on the surface so as to prevent the chill resulting from cold rains, snow, and frost, nor was tepid water employed to maintain due moisture. Absurd as it may appear such was the practice, worse ten times than only affording a covering of protective material at the surface against frost. I only know one border heated by pipes underneath where the Vines succeed; the Vines being planted inside, the branches are in a mean temperature of 65° to 70°? Roots, it would appear, are of no consequence. Only afford heat and moisture to the branches, the eyes will swell, the leaves unfold, of long litter placed over it in October, and renewed in December, the inside border being well supplied with water and liquid manune alternately as may be required. Results may be diverse when the same means are employed, only there are two ways of employing them—viv. right and wrong

retive when the same means are employed, they have a set two ways of employing them—viz., right and wrong.

Pot Vines were recently raised and grown in bottom heat, now the practice is almost if not quite abandoned, quite as strong and equally well ripened canes being obtained without it; but I do not admit this as evidence of the futility of covering outside borders of early vineries, for the roots then enjoy the same temperature as the canes, and the activity of both is equal, but I consider no one would be so bold as to force Vines in pots with the latter plunged outside and the canes introduced through holes in the wall, affording the canes a summer temperature whilst the roots are amidst the cold and wet of winter. Mr. Rivers adopts a more rational plan and places the pots on the hot-water pipes, and all growers wishing for good results would at least have the pots inside the house, and if practicable start the plants in beat afforded by fermenting materials. The roots like to run in decomposing matter which contains plenty of food in a form that the roots can readily absorb and the foliage assimilate. Those advocating the non-covering of Vine borders with a thick covering of protective or fermenting materials, will be unable to tell us that this season's experience has proved the soundness of their views and practice,—G. Abbery.

OLD-FASHIONED FLOWERS.

YES! we have actually fashions in our gardens, and very tyrannical, expensive, and monotonous some of them are. Carpet bedding, for instance, is in fashion now, and I cannot but regret that so much space is given up to it and plants of the ordinary bedding type in gardens. Let me be consistent and acknowledge having frequently written in favour of the bedding-out system, and warmly defended it too; nor am I about to decry it, but rather to ask that it be kept within due bounds, and that a fair proportion of space be reserved specially for those old favourites of our boyhood that have come to be known under the designation of "old-fashioned flowers" by those garden radicals who can see no beauty apart from what the Premier has termed "hard and scentless mutations of art." "Flower gardens," writes the same authority, "should be sweet and luxuriant. Give me Cabbage Roses, Sweet Peas, and Wallflowers, bushes of Honeysuckle, and bowers of Sweet Peas and Sweet Briar, and Jasmine clustering over walls; Gillyflowers, banks of Violets, Mignonette, Roses, and Carnations, the Lily, the Heliotrope, and the Stock."

It cannot be denied that expression is here given to a general feeling that such flowers should be found in every garden; nor in order to have them need we discard our charming beds of spring flowers, so soft-tinted and fresh, or the fuller riper beauty of the more brilliant summer flowers. No plant or bed of a few brief weeks' duration, however beautiful it may be, can ever rank in our esteem with the favourite of years, the sturdy old perennial that has grown to be as dear to us as an old friend.

Most of us cultivate too many plants, collection rather than selection is our aim; but then the difficulty is to know which to choose where all are beautiful. "My husband always has twice as many plants as he has room for," said a friend to me not long ago. "Ah, ah!" laughed the culprit, "I never can refuse a good thing, and you know we like at any rate to keep up with our neighbours." A very common, but nevertheless mistaken, notion is this of keeping abreast of our neighbours by cramming our garden with twice as many plants as it is capable of well containing. Much more praiseworthy is the spirit of rivalry when devoted to the culture of a few really choice plants, and much greater the pleasure they afford than a crowded assemblage of starvelings, however choice they

may be.

Often have your readers been advised to devote a border specially to old-fashioned flowers. I for one must plead guilty to having done so, yet now I must acknowledge that long formal borders are in themselves objectionable. Beautiful plants are the only thing attractive about them; why, therefore, cannot we group our plants in the thousand and one nooks, corners, and beds that may be contrived for them? How charming the effect, how pleasant the surprise, of an extraordinary fine specimen of some familiar old favourite meeting the eye unexpectedly in some secluded nook, or challenging observation boldly upon some prominent slope or open position among shrubs!

To enumerate a long list is not the object of this paper, yet I may mention a few old favourites that ought to be cultivated by everybody and as a sort of nucleus to which might be added many choice varieties of Phlox, Pyrethrum, Pentstemon, Pæonies, and Carnations. Of those which occur to me as being as familiar as a garden itself there are Daphne Cneorum, Solomon's Seal, Dielytra spectabilis, Fuchsia Riccartoni, Andromeda Catesbæi, Gentiana acaulis, Arundo conspicus, Pampas Grass, Stipa pennata, Briza maxima, Loosestrife in two or three varieties, Spiræa japonica, S. palmata, Gunnera scabra, Bocconia cordata, Yucca recurva, Y. gloriosa, Acanthus latifolius, old China Monthly Rose, Cabbage Rose, common Moss Rose, Gloire de Dijon Rose, Erica carnea, E. mediterranea, Rosemary, Lavender, and the old white Pink, so delicious in its perfume as to load the surrounding air with its sweetness. Let me add one regret. I used to grow magnificent specimens of Lavender from 1 to 2 yards in diameter, of a handsome globular form, in three or four years from the cuttings, in not very rich soil overlying masses of limestone; but among the ferruginous sandstone of Sussex it displays none of this desirable vigour or beauty of contour.—EDWARD LUCKHURET.

FIG CULTURE.

SEVERAL years ago some remarks made by me on the summer pruning of Figs on open walls were considered worthy of admission into the Journal. Since that time the same culture has been successful, with the exception of this year, which may perhaps be attributed to the inclemency of the season.

The plan mentioned by Mr. Rivers (see "Orchard House," page 136, 15th edition), has been practised here some years. Bushes about 3 feet high are placed in October in teorer of a dark cellar, and removed in the beginning of May to a border in front of a wall. These usually produce a fair crop of fruit; but this year, in the case of bushes promising twenty Figs, there are not more than six on each, the severity of the weather after their removal to their summer stations having probably caused the dropping of fruit.—J. J. T., Herts.

DWARF CAMPANULAS.

THERE are now in English and continental gardens a great number of species and varieties of Campanulas, which well merit their position and amply repay the cultivator for the very small degree of attention they demand. They are adapted for a great variety of uses—as ornamental border plants, as choice gems for the rockery, and in pots for the shelves or beds in conservatories. For these purposes we have species of very diverse habits, shrubby, semi-shrubby, herbaceous, and dwarf. To the latter we will now devote a few notes. These little plants are mostly attractive and graceful either in pots or on the rockery, for which some of them are specially adapted, and as many are in cultivation there is no difficulty in obtaining several distinct and pretty species with flowers that exhibit various tints of blue and purple fading to pure white. They are truly sum-mer-flowering plants, and the majority are in perfection during June and July, but several prolong their period of beauty far into September. Of course, in the case of those cultivated in pots under glass it is easy to have them in bloom much earlier, and a succession may be maintained from April to September. We do not intend enumerating all the dwarf forms of Campanula, but only those that are most easily grown and are best fitted for the purposes mentioned.

The following is a selection:—C. turbinata, a native of the mountains of Transylvania, is a pretty tufted species from 6 to 9 inches in height, bearing numerous fine, open, bell-shaped flowers. This plant and its varieties succeed well on the rockery or in a border of rich light loam. C. carpatica—this plant, as the specific name implies, is a native of the Carpathian Mountains, and is consequently perfectly hardy. It is valuable chiefly for two reasons, first that it is quite at home in any position—rockery, border, or pot, and requires but moderately light and rich soil; second, that it continues in bloom from June to September, yielding a quantity of bright blue flowers. It generally reaches about 9 inches in height, is compact in habit with heart-shaped leaves. C. garganica, a pretty little plant found in Istria and Monte Gargano. It is well adapted for an elevated position on a rockery, where it would be free from any stagnant moisture; it may also be grown in pots, but the surface of the soil should be slightly raised above the rim of the pot. The lower leaves are roundish, but the upper are

heart-shaped: the flowers are a delightfully fresh blue with a ! white centre, and they are borne in loose racemes. C. g. hirsuta differs from the species in its foliage being more hairy. C. alpina, a native of the Swiss Alps, is of erect growth, about 8 inches in height, with lanceolate leaves. The flowers are of a beautiful dark blue, pretty bell-shape, and they are borne in pyramidal racemes. This plant does well on the rockery, but not in shady or damp borders. C. rotundifolia is small and well suited for pot culture, and continues in bloom a considerable time. This scarcely needs description, for the Scottish Bluebell must be well known to many readers of the Journal. There is a white well known to many readers of the Journal. There is a white variety which is very pretty. C. muralis, diminutive and of prostrate habit, native of South Europe. The leaves are cordate, with a dentate margin; the flowers are of a pale violetblue tint and very numerous. This species is well suited for growing in a pot or on the rockery. C. rupestris is somewhat similar, but the leaves are larger and the plant is more tuffed in helpit the flowers being the leaves are larger and the plant is more tuffed. in habit, the flowers being pale blue and expanded. C. pulla, an Austrian species, is an extremely pretty plant. The leaves are oval and glabrous, and the bell-shaped flowers of a fine purple colour. This is one of the most attractive plants for the rockery, where it continues in flower during the greater portion of summer.

The majority of the species enumerated are herbaceous perennials, and can be readily increased either by cuttings, division, or seeds; but the biennials, such as C. garganica, produce seed freely, and by that means are most easily propagated.—L. CASTLE.

THE CROPS IN THE SANDY DISTRICT, BEDFORDSHIRE.

THE results of the late cool and dripping weather will prove serious in many respects to market gardeners in this locality, and in many cases it has been impossible to get the land clean. Cucumbers, after having been in some instances sown three times, have been mostly ploughed up, and only in sheltered places with a good autumn sun will a crop be obtained. Great doubts are entertained whether any Onion seed can be harvested, as the heads have scarcely yet expanded. The crop of Onions is a good one, but thick necks largely prevail, as also with picklers, and both have a tendency to rot.

Early Potatoes are being fast secured, and in most instances in good condition and average crops, but disease has shown itself in the tops, which have died-off, leaving the tubers apparently prematurely ripened-off and sound. Late Potatoes look promising. Scarlet Runner Beans are looking well and have withstood the wet remarkably well. This season they will be in advance of the Dwarf French Beans, which are only just recovering from a very starved appearance. Peas where thick are in some instances rotting on the ground, and it has been impossible to gather them green. Should, however, warm dry weather quickly come there will probably be a fair harvest of seed of the early sorts. The late varieties have, however, dropped their flowers a good deal. Turnip seed has set badly and the yield will be inferior. Much of the hay crop in the valleys of the Ouse and the Ivel has been under water, and is spoiled. Oats, and especially Barley, on the cold lands look bad indeed, and Wheat in some cases is very thin although flaggy. Altogether there is a very desponding feeling, and gloom surrounds both the spade and the plough.

—T. LAXTON.

SLUGS AND SNAILS.

WHAT is the best mode of destroying slugs, snails, and their eggs without damaging vegetation? One would have thought that last winter would have killed all of them, but they are livelier, stronger, bigger, and more numerous than ever. They are fairly eating up my garden, as Zulus would do a patch of mealies, or as I have seen locusts do a crop in Syria. They have completely cleared off three successive (but most unsuccessful) sowings of French Beans and Scarlet Runners. They have gobbled up several Cucumbers and Vegetable Marrows entirely. Only last night they are up the leaders of two Vegetable Marrows as thick as walking sticks, and have just taken a fancy to a bed of very choice Delphiniums, for the seed of which I paid a fancy price. I have tried paraffin o'l and water, McDougall's disinfectant powder, and nitrate of soda. The last is the most effectual of the remedies. If it touches the bodies of snails or slugs it soon kills them, but it also kills or damages the plants; for instance, if a Cauliflower

or Cabbage receives a speck of the soda it is not palatable if cooked, nor can Lettuces be eaten if they have been in contact with it. I gave my manure heap a good dressing of quickline last winter, thinking it would kill them and their eggs, but they actually seemed as grateful for it as poor cottagers would have been for a load of coals, for it only "warmed" them without any vital inconvenience: indeed the tonic seemed to strengthen them rather than otherwise.

Seriously speaking, can any of your readers from experience tell me what will destroy snails, slugs, and their eggs? I believe that in my own case the manure heap has been the nursery. If this is correct, what is the proper thing to mix in the heap, which is composed of vegetable refuse and the contents of an earth closet? Has anyone tried nitrate of soda mixed in the manure heap (14s. per cwt. makes it rather costly), gas lime, quicklime mixed with salt or with soot, and in what proportions? If successful I have an idea that gas lime would probably be most efficacious, but it is so powerful in its action that I fear to use it without knowing more than I do what proportions of it to use to a manure heap or to put on the open ground.—G. O. S.

SOUTHAMPTON SUMMER SHOW.

AUGUST 2ND AND 4TH.

On Saturday last the Royal Southampton Horticultural Society held their seventeenth annual Exhibition in Westwood Park, an extensive and beautiful estate situated on an eminence north of the town, a position that was admirably adapted to the purpose. The exhibits were generally excellent, and this was particularly noticeable in the groups and collections of plants which const tuted the great features of the Show. Very numerous classes were provided, and the prizes offered were in the majority of instances sufficiently high in value to produce a close and vigorous compo by nursery men in value to produce a close and vigarous competition. In two of the classes for collections of plants exhibited by nursery men and gardeners respectively four prizes were offered, which varied in value from £10 to £2. In the other classes there was every gradation from £6 to 8s. The exhibits were arranged in six large tents placed parallel with each other, which appeared to be somewhat inconvenient and occasioned rather unpleasant crowding at one period of the day. We think the tents are preferably placed in a line. A numerous and aristocratic company assembled during the afternoon of the opening day, and were favoured with fine weather, without which a flower show succeeds

but poorly.

GROUPS.—We have already noticed that the groups and collections of plants were unusually numerous and good, and we will now tions of plants were unusually numerous and good, and we will now mention the most prominent exhibits, commencing with the former. For a group of miscellaneous plants to occupy a space of 12 feet by 10 feet five prizes were offered, the first prize of £6 being presented by the Mayor and Corporation of the town. Six competitors entered the field, and their methods of arrangement were sufficiently good to cause the Judges a little difficulty in one or two cases. A quadrangular form was adopted, and the turf was raised round the edge of each group to conceal the outer rows of pots. The Mayor's prize was easily obtained by Messrs. Jackson and Son, Kingston-on-Thames, who had a light and graceful arrangement. A large Dicksonia antarctics formed the centre, and was surrounded with Palms, Dracænas. Ericas, and Statices, the and was surrounded with Palms, Dracenas, Ericas, and Statices, the margin consisting of small Dracophyllums, Kalosanthes, Adiantum gracillimum, and Aira cæspitosa: the whole was extremely tasteful. The next position in order of merit was allotted to Mr. E. Wills, gardener to Mrs. Pearce, The Firs, Bassett. This group was somewhat too flat with a high edge, and the surface was not broken enough, but it was otherwise bright and pretty. A Muss formed the centre, and around this were plants of Lilium auratum, Dracænas, Crotons, Celosias, Pelargoniums, and Palms, Tuberous Begonias being placed at each of the angles. Mr. W. Browning, gardener to F. Holloway, Esq., followed with a rather formal arrangement but attractive, the edging being very pretty, composed of Lobelias, Isolepis, and Gloxinias. The two remaining prizes were secured by Mr. J. Kingsley, Bevois Valley, and Messra. Oakley and Watling in the order named, with groups of only ordinary merit. margin consisting of small Dracophyllums, Kalosanthes, Adiantum ordinary merit

Some remarkably handsome specimens were shown in the classes for collections of miscellaneous plants. In the nurserymen's class for eighteen plants, not less than five to be in flower, Messrs. Jackson & Son again carried off the honours with a collection. Messrs. Jackson & Son again carried off the honours with a collection that was greatly superior to the others. It included an excellent Kalosanthes over 8 feet in diameter, with abundance of unusually bright flowers; a fine Cocos Weddelliana 6 feet high, graceful and healthy; Allamanda Hendersonii and A. nobilis well grown and flowered, and Dipladenia amabilis, bearing richly coloured flowers in profusion. Messrs. Oakley were second, and Mr. J. Kingsbury third with small but good plants.

In the corresponding class for gardeners the first prize was most justly awarded to Mr. E. Wills for as neat and beautiful a collection of plants as could be seen. One handsome specimen

of Alocasia Lowii was especially noticeable for its vigorous finely of Alocasia Lowii was especially noticeance for he rigorous meny coloured foliage; the plant was over 5 feet in height. Alocasia metallica was another fine specimen nearly 5 feet in diameter, the peculiar metallic hue of the foliage being in perfection. Dieffenbachia Bowmannii was in superb condition, and also a Dieffenbachia Bowmannii was in superb condition, and also a large specimen of Clerodendron Balfourianum over 6 feet high, evenly trained and flowering profusely. Mr. N. Blandford, gardener to Mrs. Haselfoot, Moor's Hill, was placed second with a collection of neat and even plants, which included a Cyanophyllum magnificum, Adiantum pedatum, and Dendrobium nobile. Mr. W. Browning secured the third prize with fair specimens.

Ferns were exhibited in good form, particularly in the class for six store or greenhouse species or varieties. Mr. E. Wills obtained the premier award for handsome vigorous specimens of Advantum curvatum a superh A gracilliumum nearly & feet in dia-

Adianum cuneatum, a superb A. gracillimum nearly 3 feet in diameter, A. farleyense, and Davallia Mooreana excellent. Mr. T. Avery, gardener to H. McCalmont, Esq., Highfields, followed with Avery, gardener to H. McCalmont, Eeq., Highfields, followed with large specimens, Davallia Mooreana being enormous, about 4 feet high and 7 feet in diameter; Adiantum cardiochlena and Lomaria zamisfolia were also good. Mr. Avery was first with six hardy Ferns, all Athyriums, in excellent health. Mr. E. Wills and Messra. Jackson & Son followed, there being in all five competitors. Mr. E. Wills secured the chief prize for Selaginellas, and his specimen of S. cassia possessed its beautiful glaucons tint in perfection. Numerous other plants were well represented, which we cannot describe in detail—as, for instance, Tuberous Begonias. Fuchsias, Celosias, &c.

Cut flowers were not very abundant, but table decorations were well exhibited, and were sufficiently numerous to require a tent to themselves. In the class for twenty-four cut Roses Mesers. Keynes & Co., Salisbury, gained the chief prize with extremely fine blooms of the best varieties. The following were noticeable

fine blooms of the best varieties. The following were noticeable for their substance and good colour: Madame Marie Bady, Horace Vernet, Marie Baumann, and Reynolds Hole. Mr. Edward Hillier, Winchester, was second with only medium blooms. Mr. Charles Turner of Slough sent twelve boxes of superb cut Roses that were highly creditable to the exhibitor.

FRUIT.—This was exhibited in fair condition generally, but the Grapes were indifferent. In the class for eight dishes of fruit Mr. W. F. Simpson, gardener to W. Baring, Esq., Norman Court, Dean, was placed first with well-ripened Black Hamburgh Grapes, good Peaches and Nectarines, and fair Currants, Gooseberries, and Stawberries. Mr. Jones, gardener to Lady Barker Mill, Mottisfont Abbey, secured the second prize with a collection that was inferior to the last only in the Grapes. Mr. E. King, gardener to Lady M. Charteris, Efford Park, Lymington, was third with rather small and imperfectly ripened fruit. The only other exhibit worthy of motice was the two bunches of Muscat of Alexandria from Mr. J. Allen, gardener to J. Bailey, Esq., Elmsfield, which were the best Allen, gardener to J. Bailey, Eq., Elmsfield, which were the best white Grapes in the Show, and although the bunches were small the berries were superbly ripened and coloured; the first prize

was awarded.

Vegetables were abundant and well grown, and the principal prizes were awarded to Mr. W. Simpson; Mr. W. Sanders, gardener to J. East, Esq., Lymington; and Mr. H. Vickery. The cottagers' productions were more numerous than usual, and as many as 150 competitors entered the lists. The small fruits and vegetables were excellent, and the Potatoes were all that could be desired.

BRITISH PLANTS.-No. 2.

(Continued from page 463, vol. xxxvi.) MARSH PLANTS.

HAVING on page 463 referred to water plants and alpine

plants of interest to the botanical collector, I submit the fol-lowing as worthy of attention and cultivation:—

Lythrum Salicaria.—This very showy plant may often be seen from the windows of a train, for it is so conspicuous with spikes of purple blossom rising often 4 feet high or more by some ditch side, and it is also often found by the sides of ditches lining the country roads of a stiff clayey district, moisture being its principal requirement. It is easily found, as it is met with almost everywhere in August.

Parnassia palustris.—This plant, contrary to the last-named one, requires seeking after and is not so easily found, as it is of lower growth, and often grows amongst the rank plants of a marsh, its pretty blossoms never reaching so high as the blades of grass by which it is surrounded. It is, however, well worth looking after in such places. The blossom resembles those of some of the Ranunculuses, and its classical name, Grads of Parnassus, is not the least of its charms. It is more plentiful in Lancashire and other northern counties than in the south, where artificial drainage has obliterated it. Narthecium ossifragum (the Lancashire Asphadel) is also

found in situations like the last, presenting a little neat spike

of yellow flowers pretty and interesting.

Drosera rotundifolia.—This seems to be confined to peaty

marshes, whereas those previously given are all met with where peat does not abound. The Drosera or Sundew was associated a few years ago with the class of carnivorous plants, and the fact of the tips of its hair-like glands being always furnished with a drop of matter like dew has for many ages given it a place amongst interesting plants. It is not by any means plentiful, and its sites are not perhaps so plentiful in the south of England as in Scotland. It is, however, well worth seeking, as other interesting plants will often be found in the same neighbourhood, not the least so being Hydrocotyle vnloarie

Comarum palustre.—This also is found on peaty bogs, where its flowers, resembling a Geum, are not remarkable only for their abundance, and it is more widely spread than some of the above. It is, however, far inferior in beauty to the

following.

Monyanthes trifoliata (Buckbean or Marsh Trefoil).—This is amongst the most beautiful of all our British plants, and is found in wet boggy places mostly of a peaty nature. I have seen it in a wet pasture where cattle fed, but I do not think they meddled with it much, as it is a strong bitter, and has been, I believe, used in the Highlands of Scotland, Hooker says, as a substitute for Hops, and also medicinally; but it is on account of its beauty that I wish to call attention to it here. Its blossom is produced in clusters, are beautifully fringed and exceedingly pretty. I do not think any attempts have been made to introduce it into gardens, most likely on account of the difficulty of giving it a suitable site, as it likes water.

Myosotis palustris .- Popular as the garden forms of this plant really are. I do not know any variety which exceeds either in size or beauty a good specimen of the species when met with growing in a ditch into which perhaps some of the sewage of a farmyard has found its way. Such places are here and there met with, and where this plant is thus found luxuriating its beauty far exceeds that of its brethren in dry poor soils of the flower beds.

PLANTS OF UNCERTAIN HABITATS.

Pinguicula vulgaris.—This plant, which a few years ago was with some others brought prominently before the public as being possessed of carnivorous properties, is also of great beauty and interest, and it is for these reasons that I now mention it. Dwarf-growing and compact, it looks as if it could easily be transplanted. I have not met with it in a wild state for many years, but I recollect finding it in the greatest abundance on a piece of what might be called the worst land in existence. It was near the margin of a large pond, and, in fact, the place where it was growing had been a part of the same pond itself; all the good soil had been removed and nothing but clay left, but the water being drained off Nature attempted in her usual way to clothe the surface with vegetation with small patches of a coarse stubby grass. These in time increased in size, so that the ground consisting of several acres was scattered all over with thin patches of coarse grass standing a little above the ordinary level of the clay base; but around the edges of these hillocks, which often did not exceed in size more than good spadeful, were scores of plants of this Butterwort, growing on the sloping sides of these little mounds, but so plentiful that it would have been an easy matter to have filled a wheelbarrow or even a cart in a short time with them. It is certainly a mistake to suppose that peat is required in its cultivation, as nothing could be more unlike post than the clay in which it was growing, but it is certainly a pretty and interesting plant.

Pyrola rotundifolia is remarkable for its pretty green foliage,

green even in winter, but I expect only under shade; in fact I always find it growing in shady places, and never more plentifully than under the shade of a Scotch Fir plantation on a stiff clayey soil. I think I have been told that Linnæa borealis

is also found in such situations.

Cypripedium Calceolus.—This is, perhaps, the rarest of all British plants, and I have never found it wild anywhere; and, in fact, I know only of one locality where it grows wild, and that, perhaps, it would not be prudent to mention. It is, however, an exceedingly pretty plant, equalling any of the exotic Orchids that I am acquainted with, and highly deserving of cultivation.

This list might be extended to an indefinite length, but it is needless to do so here, further than to say that some of our wild Orchises are as much deserving of study as exotic species are of cultivation, and perhaps there is nothing more interest-

JOURNEYING from London to Liverpool vid the Midland system through Derbyshire, one of the most picturesque districts in England is traversed, and arriving at Sefton Park, one of the most beautiful public parks in the provinces is reached. In this park was held the first Show of the above Association, which far ex-ceeded in magnitude and quality any shows which have been held in Liverpool during recent years; indeed it is questionable if an exhibition in all respects so meritorious has ever been arranged in the vicinity of the first town in the kingdom and the first port the vicinity of the first town in the kingdom and the first port in the world as the Show in question. It was, in fact, one of the finest provincial shows of the year. The Manchester Whitsun Show was pre-eminent for Orchids and Roses in pots and Rhododendrons, the York and Leeds Exhibitions for Pelargoniums, and the Newcastle gathering for table decorations, all of which features were absent at Liverpool, yet there were compensating advantages such as, thanks especially to Messrs. Cranston and Prince, also to Messrs. James Dickson & Sons and Francis and Arthur Dickson & Sons of Chester: Alexander Dickson & Sons of Chester: Alexander Dickson & Sons of Chester: Arthur Dickson & Sons of Chester; Alexander Dickson & Son, Belfast; and Dickson & Robinson, Manchester; and others for the great display of cut Roses, while the fruit on the whole was equal if not superior to any exhibition of the kind that has been seen this season. Plants also were as good as could be produced at the period of the year, as will be readily admitted when it is stated that such famed cultivators as Messrs. Cypher, Cauldwell, Hammond, Tudgey, and Cole put forth their strength for the honours in the chief class. The nurserymen's collections too, as will be seen below, were extensive and excellent; and local growers exhibited admirably in the various classes.

exhibited admirably in the various classes.

The schedule was arranged in two sections, twenty-four classes being "open to all England," the remaining thirty-nine classes being for local exhibitors. The prizes were generally good, at least sufficiently so to ensure entries in every class, and in nearly every case the products entered were staged. Of two important exceptions one was a melancholy one, and the other unfortunate.

Mr. Miles, Wycombe Abbey, was unable to compete in the fruit and verstable classes on account of the death of Lady Caving. and vegetable classes on account of the death of Lady Carington, and Mr. Cole, Withington, in the principal plant classes on account of a "smash" at the Liverpool station that rendered his plants unfit for exhibition. Some of the Judges of the Show inspected Mr. Cole's plants at the station, and sympathised with the owner on the loss and disappointment he had sustained by the untimely mishap, for had the plants been staged in good condition

they would have won prominent positions in the prize list.

The Exhibition was arranged in four marquees "new for the occasion," belonging to Mr. Howard of Liverpool. No. 1 was a grand tent 200 feet long by 45 wide. The principal specimen plants were arranged down the centre, no stage being employed nor needed, as the specimens were sufficiently large to furnish the large space devoted to them. Narrow tables along the sides of the tent accommodated the boxes of Roses and other cut flowers, table plants, new plants, &c., and the effect produced was very imposing. Another tent 100 feet by 45 contained the nurserymen's ollections; a round tent plants in the minor local class, and a similar erection the fruits and vegetables. All the marquees were quite filled, some of them, indeed, being overcrowded. In referring to the exhibits we will first notice the PLANTS.—In the open class for twelve stove and greenhouse

PLANTS.—In the open class for twelve stove and greenhouse plants, six foliage and six flowering, four collections were staged; the fifth, Mr. Cole's, being hors de combat at the station. Mr. Cole was utilised as a Judge, the number of Judges originally appointed being quite inadequate to get through a Show so large in an hour and a half, the time at their disposal. The prizes in the premiet class in question went in the following order:—First Mr. Cypher, Cheltenham; second Messrs. Cauldwell & Sons, Knutsford; and third Mr. Hammond, gardener to Sir Wilfrid Lawson, Bart., Brayton Manor, Carlisle; Mr. Tudgey for once being "out of it." Mr. Cypher's foliage plants were a fine Pritchardia pacifica, with leaves 8 to 4 feet in diameter; Thrinax elegans, 12 to 14 feet high; Cycas Normanbyana, with a stem of 8 feet and a spread of leaves of 7 to 8 feet, a grand plant; Latania borbonica, large, fresh, and fine; Croton majesticus, a well finished and brilliantly coloured specimen 4 feet in diameter; and a superior example of Gleichenia Mendelli, 45 feet across and in superb condition. His flowering plants were Ixora amabilis, 8 feet, densely flowered; Dipladenia Brearleyana, of the same size, with two dozen flowers; large examples of Allamandas nobilis and Hendersoni, Clerodendron Balfourianum, a globe 5 feet in diameter; and a small but well-flowered speci-Aliamandas notilis and Hendersoni, Cierodendron Balfourianum, a globe 5 feet in diameter; and a small but well-flowered specimen of Erica venosa—a very fine collection. Messrs. Cauldwell's best plants were Areca Baueri, wonderful for its colour and massiveness; Gleichenia rupestris, a fine specimen 5 feet in diameter; and good examples of Cooos Weddelliana, Cycas revoluta, Croton variegatus, Allamanda Hendersoni, Bougainvillea glabra, and Erica Iveryana. Mr. Hammond, who was a close

third, staged amongst others a splendid Cocos Weddelliana, plants in flower and correctly named.—J. Robson.

LIVERPOOL HORTICULTURAL ASSOCIATION'S

SHOW.—AUGUST 2ND AND 4TH.

JOURNEYING from London to Liverpool vid the Midland system

Liverpool from London to Liverpool vid the Midland system

Journeying from London to Liverpool vid the Midland system mens, which he had evidently reserved for the next class for six plants in flower, where he easily won the first position with Ixon amboynesis, 8 feet, well furnished and flowered; Phenocoma prolifera Barnesi, 2½ feet, very fresh and good; Anthurium Schertzerianum, with fine spathes and foliage; Statice profusa, and Ericas Fairreana and Williamsi. Messrs. Cauldwell were placed second.

In the open class for eight fine-foliaged plants Mr. Hammond secured first honours with an immense specimen of Cycas revoluta in fruit, a large Croton angustifolius, Acanthorrhiza Warscewiczi, fine; Maranta Veitchii, Chamserops humilis tomentosa, Dicksonia antarctica, and good examples of Crotons majesticus and C. Weismanni. Messrs. Cauldwell & Sons were an excellent second; Areca Verschaffelti 10 feet high was in splendid colour, and very fine indeed were Thrinax elegans, Cocos Weddelliana, Cycas intermedia, Davallia Mooreana, Gleichenia dichotoma, with Crotons pictus and varieszatus. In the open class for eight fine-foliaged plants Mr. Hammond

Crotons pictus and variegatus.

Crotons pictus and variegatus.

In the open class for six new Dracenas Mr. B. S. Williams, Upper Holloway, London, secured the premier position with fine healthy plants about 3 feet high of Robinsoniana, Duffii, Goldieana, Leopoldi, Bausei, and superba, all in fine health and colour. Mr. Hammond was second, and Messrs. Kerr & Son, Aigburth Nurseries, Liverpool, a very close third. For six new Crotons Mr. Williams was also first with healthy examples 3 to 4 feet high of Burtoni, Williamsi, fasciatus, Henryanus, albicans, and concinnum. Mr. Hammond was second with nobilis, Evansianus, Oueen Victoria. Etns. Disraeli and Rev

concinnum. Mr. Hammond was second with nobilis, Evansianus, Queen Victoria, Etna, Disraeli, and Rex.

In the open class for eight exotic Ferns Mr. Peers, gardener to R. Rayner, Esq., Wavertree, was first with an excellent collection comprising Cibotium princeps, Dicksonia antarctica, Davallia polyantha and D. Mooreana, both 6 feet in diameter, Goniophlebium appendiculatum, Gymnogramma chrysophylla, and Gleichenia spelunces. Mr. Hammond was second also with a fine collection. In the corresponding class for twelve hardy Ferns, distinct, first Mr. C. Rylance, Ormskirk, with good plants of Adiantum Capillus-Veneris, Lastrea Filix-mas grandiceps, Lastrea F.-m. cristata. Polystichum angulare proliferum, Adiantum pe Adiantum Capillus-Veneris, Lastras rint-mas grantesis, Polystichum angulare proliferum, Adiantum pedatum, Osmunda regalis cristata, Athyrium Filix-formina Craigi, Lastrea F.-m. cristata angustata, Athyrium Fieldise, Polystichum aculeatum cristatum. Scolopendrium vulgare crispum. Mr. F. Lastrea F.-m. cristata angustata, Athyrium Fieldise, Polystichum aculeatum cristatum, Scolopendrium vulgare crispum. Mr. F. Faulkner, gardener to F. R. Leyland, Esq., Woolton Hall, was placed second with the following plants:—Lastrea F.-m. grandiceps, Athyrium F.-f. Simmonsi, Athyrium F.-f. Fieldise, Scolopendrium vulgare variabilis, Athyrium F.-f. Craigt, Osmunda cristata, Athyrium F.-f. Pearsoni, Osmunda gracilis, Athyrium F.-f. shumese Polystichum aculeatum plumoanum Lastrea F.-m. cristata. cristata, Athyrium F.-f. Pearsoni, Osmunda gracilis, Athyrium F.-f. plumosa, Polystichum aculeatum plumosum, Lastrea F.-m. cristata, Lastrea F.-m. Bolandse. Third, Mr. J. Gore, Elmfield, Princes Park, Liverpool, whose plants were very good, and contained three seedling Athyriums beautifully crested and distinct; one of these, A. F.-f. Holderianum, was granted a first-class cartificate, and is a great acquisition to this class of hardy Ferns.

Only three collections of Ericas were staged, and the plants were not of great excellence. The smallest and best were Messr. Cauldwell's first-prize quartet—quarter-anecimens of Eximes

were not of great excellence. The smallest and best were Messrs. Cauldwell's first-prize quartet — quarter-specimens of Rximes superba, McNabiana, Ne Plus Ultra, and semula. Mr. Tudgey was second with larger but thinner plants. Had Mr. Cole been able to have staged his plants, which we saw, he would probably have been first in this class as unquestionably he would have been in the class for the best specimen Orchid with a splendid example of Miltonia spectabilis with forty flowers, many of the spikes having two flowers. The prize, however, was well won by Mr. Sherwin, gardener to Morton Sparke, Esq., Huyton, with Aërides suavissimum with five drooping spikes; Mr. Cypher being second with Dendrobium superbiens. a richly-coloured being second with Dendrobium superbiens, a richly-coloured variety. Mr. Sherwin also won the chief prize in the class for four

variety. Mr. Sherwin also won the chief prize in the class for four Orchids with Disa grandiflora, four spikes, nine flowers; Cattleys guttata Leopoldi; C. crispa, three spikes, twenty flowers; and Oncidium Wentworthianum. Mr. Cypher was second with Oncidium Marshallianum, very bright; Saccolabium Dayanum, very long drooping spikes; S. Blumei, and Cypripedium barbatum. In the open class for eight table plants (the prizes given by Messrs, Ireland & Thomson, Edinburgh), there were eleven entries. The plants being arranged in a single line behind the Rose boxes imparted an agreeable finish to that part of the Show. Mr. Ward, gardener to T. H. Oakes, Req., Riddings House, West Derby, secured the first prize with Pandanus Veitchii, Aralia elegantissima, A. Veitchii, Croton majesticus, Cocos Weddelliana, Draosna secured the nest prize with Fandanus veticum, Araita efeganuseima, A. Veitchii, Croton majesticus, Cocos Weddelliana, Dracema Guilfoylei, Terminalia elegans, and Croton Weismanni; Mr. Hammond was second. The plants were about a foot in height, elegant and healthy. The great number of small and meritorious plants staged in this excellent class suggest that classes for groups of plants arranged for effect would be well responded to, as there are necessarily many good plant cultivators who are unable to compete in the specimen-plant class and yet who ought not to be

"left out in the cold." In the open class for six Zonal Pelargonims Mr. C. Rylance secured the premier prize with extremely neat well-flowered examples about 2 feet in diameter; Mr. Whitefield, gardener to J. T. Cross, Esq., Beechwood, Aigburth, being

We now refer to the plants exhibited in the local classes, several of which were of great excellence and not excelled by any in the preceding section of the Show. In the class for eight plants, four foliage and four flowering, Mr. Messe, gardener to C. W. Neumann, Esq., Wyncote, Allerton, secured the first position with a collection which we have seldom seen surpassed at any exhibition. They comprised Croton variegatus 8 feet in diameter and in splendid colour; C. angustifolius of equal size, but wanting in colour; Alocasia metallica 6 to 7 feet across, in a 2-feet pan, magnificent; A. macrorhiza variegata, good; Allamanda Hendersoni, a superior specimen; Ixora Prince of Orange, small but good; a good specimen of Begonia Vesuvius, and Plumbago capensis. Mr. Blomiley was an excellent second with Cyanophyllum magnificum, Alocasia macrorhiza variegata, and Crotons Weismanni and undulatus as foliage plants; the flowering specimens comprising Kalocanthes coccines, fine; Allamanda Schottii, Bouvardia Vreelandi, and Ixora coccines, all in admirable condition. Third honours were secured by Mr. M. Wood, gardener to W. Crossfield, Esq., Annesley, Aigburth, with a very meritorious group, Anthurium regale being 6 to 7 feet in diameter.

There were eight entries of six fine-foliage plants, the premier prize being awarded to Mr. Cubbon, gardener to Alison Johnson, Esq., Woolton Heys, whose collection included Cycas revoluta, very fine; a good Dicksonia, Alocasia macrorhiza variegata, effective; Annassa sativa variegata, good; Alocasia Lowii, and a fine example of Croton Weismanni. Mr. Peers was an excellent We now refer to the plants exhibited in the local classes, several

very me; a good Dicksonia, Alocasia macroniza variegata, enective; Ananassa sativa variegata, good; Alocasia Lowii, and a fine
enample of Croton Weismanni. Mr. Peers was an excellent
second, and Mr. Sherwin third. This was an admirable class, and
some other collections were worthy of extra prizes and of honourable mention, but owing to what we hope is the last exhibition of showing under numbers at Liverpool, we are unable to record the sames of many excellent exhibitors at the Show; and the faulty manner in which the prize cards were attached precluded our obtaining the names of several exhibitors who were awarded prizes.

obtaining the names of several exhibitors who were awarded prizes. The first prize for six exotic Ferns was won by Mr. Gore, gardener to T. Holden, Esq., Ullett Road, Liverpool, with Cibotinn regale and Dicksonia antarctica, large; Acrophorus cheirophorus, very elegant; Davallia bullata 2½ feet across, close and healthy; Pteris scaberula, and Davallia pyxidata. Mr. Elliott, gardener to W. E. Bateson, Esq., New Heys, Allerton, was an excellent second with a large Cyathea, a splendid specimen of Gymnogramma chrysophylla, and good examples of Balantium culcitum, Davallia Mooreana, and Adiantums farleyense and concinnum latum. Mr. Ramsden, gardener to W. G. Bateson, Esq., Allerton, was awarded the third prize in this excellent class of six competitors. Mr. Sherwin won the first prize in the specimen Orchid class with Mr. Sherwin won the first prize in the specimen Orchid class with Saccolabium Blumei major with five fine spikes, Mr. Elliott being an excellent second with Aërides odorata virens with six spikes but all the flowers not expanded. In the class for three plants Mr. Sherwin was successful with Cattleyas crispa and labiata and Odontoglossum Uro-Skinneri. The display of Orchids was only a small one.

a small one.

Some good Tree Ferns were exhibited by Mr. McMillan, gardener to D. O. Bateson, Esq.; Mr. Ramsden, gardener to W. B. athbone, Esq., M.P.; and Mr. Hurst, gardener to W. B. Bowring, Esq., Aigburth, who were awarded the prizes in the order named; and the prizes for single specimen Palms went to the two exhibitors first named and to Mr. Elliott. In the amateurs' class for six hardy Ferns, first Mr. B. Cubbon; second, Mr. Gore, Elmfield, Princes Park. Mr. Wright, gardener to E. Lawrence, Esq., Aigburth, was first in the class for Zonal Pelargoniums with even and good plants. Second, Mr. W. Evans, gardener to Mrs. Lockett, Grassendale House, with three pyramids and three low-trained plants.

Passing some minor classes we arrive at some good Tuberons Regonias exhibited by Messrs. Mease, Wright, and McMillan. Fuchsias were also good—the best we have seen this year; Messrs. Whitefield, Wright, Moore, and Hurst securing the prizes.

MISCELLANEOUS PLANTS.—The second tent above alluded to, 100 feet long by 40 wide, was entirely filled with nurserymen's collections. Upon entering the tent the plants from Messrs. F. & A. Dickson & Sons, The Upton Nurseries, Chester, first arrested attention, especially the beautiful collection of hardy shrubs in pots, which included Cupressus macrocarpa variegata, a remarkably fine shrub; Thuja elegantissima, Retincepora pisifers aurea, Abies polita, Taxus fastigiata aurea, Juniperus chinensis aureus, Eleganus of sorts, and many others very fine, which added materially to the attraction of the Show. The same firm had also a very large and varied collection of plants on the centre stage of the tent, including Dracæna Gladstonei, D. Shepherdi, D. Raptisti, fine plants of Aralia Veitchii gracillima, Adiantum rubellum very good, and Pteris scaberula; also a fine plant of Cycas revoluta, various small Palms, new Crotons, Coleus, and Ferns. The arrangement was very effective, and the group was highly commended by the Association.

The remaining portion of the centre stage was filled with plants

from Mr. B. S. Williams of Holloway, also a portion of the side stage. This fine contribution included many new and rare plants. The Nepenthes and Sarracenias excited much attention. Dracena The Nepenthes and Sarracenias excited much attention. Dracena Schottize, D. speciosa, D. Robinsoniana and D. Mrs. Bause were exhibited in very fine condition, also Lapageria alba, Renanthera coccinea, Oncidium fuscatum, Odontoglossum hastilabium, Dendrobium superbiens, Odontoglossum Alexandræ, Cypripedium barbatum nigrum, Saccolabium Blumei, and Vallota oculata purpurea, very distinct from the old form. This collection was highly commended.

commended.

The opposite side of the tent contained the two collections from Mr. J. Cowan, The Vineyard, Garston, and Messrs. R. P. Kerr and Sons, Aigburth, Liverpool, the former containing remarkable plants of Aralia Veitchii, Alocasia macrorhiza variegata, Artocarpus Cannoni, Kalosanthes coccinea, two good specimen plants and well-bloomed; new Crotons, Dracænas, Ferns, Coleus, Palms, Eucharis in flower, and, especially striking, two Vines in pots fruiting and trained round stakes, each Vine carrying six fine bunches, thus showing how well the pot Vines fruit as grown by Mr. Cowan. Vines in pots in other stages of development were very strong and good. This collection was also highly commended.

The last collection in this tent came from Messrs. R. P. Kerr and Sons. and was also very highly commended. They staged good

Sons, and was also very highly commended. They staged good plants of Maranta Massangeana, the old but fine Dracæna Regina, a good plant of Croton Mooreanus, also a fine pot of Nephrolepis a good plant of Croton Mooreanus, also a nne pot of Nephrolepis davallioides furcans, Erica semula, Muss vittata, Croton Queen Victoria, and fine plants of Croton Lord Derby and C. Disraeli, with other new Dracenas, Crotons, Ferns, &c. The arrangement was also effective and good. The same tent contained the curious and remarkable collection of Cacti from Mr. H. Boller, London. A few of the most striking were Echinocactus myriostigms, E.

A few of the most striking were Echinocactus myriostigma, E. Pfeifferi, Mammillaria formosa and filifera, Pilocereus senilis, Echeveria farinosa, and a fine plant of Agave Queen Victoria. A round tent contained the collections from Messrs. Ireland and Thompson, Craigleith, Edinburgh, and from Messrs. Turner Bros., Greenhill Nursery, Garston, Liverpool, the former lot occupying the centre of the tent as well as a portion of the side staging. This young and enterprising firm brought together a varied and excellent assortment of plants, including Dracænas majestica, Robinsoniana, Mrs. Bause, recurva. Schottiæ, and Renardiæ; Crotons Weismanni, a fine pyramidal plant; also fine examples of C. Queen Victoria and Lord Derby. The old Croton pictus was in good condition; these were intermixed with Palms, Caladiums, and choice Ferns. The newest Coleuses included Surprise, Distinction, Exquisite, and Fascination were very good; also a quantity tinction, Exquisite, and Fascination were very good; also a quantity of the old Blandfordia nobilis in flower, associated with Vallota purpurea, Kalosanthes, and Statice profusa. We also noticed in this assortment a Croton of great promise named interruptus aureus, a cross between Johannis and interruptus. It was granted a first-class certificate, and is very distinct and promises to be an acquisition amongst table plants. This collection was also very highly commended. A first-class certificate was awarded to a new Cypripedium exhibited by Mr. Faulkner. It is the result of a cross between C. barbatum and C. Harrisonianum.

cross between C. barbatum and C. Harrisonianum.

Messrs. Turner Bros.' collection also received a commendation from the Society. Their arrangement of small plants was very effective, and admirably suited for decorative purposes. The principal feature, however, were the wreaths and crosses made from Everlasting flowers, and the bouquets exhibited by them and tastefully arranged amongst their collection of plants, in which branch (bouquet making) Messrs. Turner appear to excel.

ROSES.—Although the prizes were not large nor the classes numerous, yet owing to the great number of entries in consequence of the lateness of the season a very fine show was produced. In the open classes of forty-eight and twelve varieties the first, second, and third prizes respectively fell to Messrs. Cranston and Co., Hereford; Mr. Prince, Oxford; and Mr. Griffiths, Tillington Nursery, Hereford. Messrs. Cranston's blooms were generally the largest, Mr. Prince's smaller but very fresh and rich in colour. It was only by careful point-judging that the relative merits of the collections could be determined. In the twelves Mr. Prince was only seven points behind Mr. Cranston, and Mr. Griffiths two points in the rear of Mr. Prince. The finest blooms staged by was only seven points beaning Mr. Cranston, and Mr. Grimtus two points in the rear of Mr. Prince. The finest blooms staged by Messrs. Cranston were Comtesse d'Oxford, Beauty of Waltham, Mdlle. Marie Rady, Duc de Wellington, Sultan of Zanzibar, Maréchal Vaillant, "Dingee Conrad," in the way of Fisher Holmes; Marie Baumann, Le Havre, Senateur Vaisse (the finest bloom in the Show), Duc de Morny (extra fine), Prince Camille de Rohan, the Show), Duc de Morny (extra fine), Prince Camille de Rohan, and Reynolds Hole. Among the finest of Mr. Prince's blooms were Baron A. de Rothschild (very rich), Duke of Edinburgh, Beauty of Waltham, Duc de Rohan, Louis Van Houtte, Le Havre, Lord Macaulay, Marie Baumann, Alfred Colomb, Horace Vernet, Princess Beatrice, Anna Ollivier, and Souvenir de Madame Pernet. Mr. Griffiths had very fine examples of Marie Baumann, Duke of Edinburgh, Madame C. Crapelet, Beauty of Waltham, and Sir Garnet Wolseley. In the amateurs' class for twenty-four Boses there were ten entries, and the prizes fell to Mr. McMaster, gardener to W. Just, Esq.; Mr. Mease, and Mr. Savin; and for twelve blooms there were sixteen entries. The premier prize was won by Mr. Ecroyde Claxton, Ash Villa, Wavertree, followed by

Messrs. McMaster and Hodgson; extra prizes being awarded to Messrs. Hall and Mease. The competition in some cases was extremely close, and the prizewinning boxes were very good, the best blooms being much the same as those above enumerated.

The miscellaneous exhibits of Roses contributed greatly to the success of this section of the Show. Messrs. Cranston sent twelve boxes of fine blooms, including a splendid stand of Sénateur Vaisse; Mr. Prince nine boxes, including fine stands of Beauty of Waltham and Marie Baumann, also a charming box of Teas con-Waitham and Marie Baumann, also a charming box of Teas containing Madame Lambard, fine, rosy salmon, and excellent older varieties. Messrs. Wm. Paul & Son, Waltham Cross, exhibited stands of Countess of Rosebery and Duchess of Bedford in superb condition, which were much and deservedly admired; also Pride of Waltham, a promising Rose of the Eugénie Verdier type; Masterpiece, a fine bloom, somewhat resembling Star of Waltham; Marchioness of Bute, rich scarlet crimson; and Lady Sheffield, clear rose. In the stands of Messrs. James Dickson & Sons we noticed as especially fine Capitains Lamure. Marie son & Sons we noticed as especially fine Capitaine Lamure, Marie son & Sons we noticed as especially fine Capitaine Lamure, Marie Rady, Madame Berard, Royal Standard, Annie Wood, and Nardy Frères. Messrs. F. & A. Dickson staged in superior condition Abel Carrière, very rich; Madame Vidot, fine; Marie Baumaun, Star of Waltham, and Duke of Edinburgh. Mr. Alexander Dickson, Newtownards, Belfast, had Comte de Rainbaud, Auguste Rivière, Charles Lefebvre, Madame G. Paul, Triomphe de Caen, and La France in excellent condition; and Messrs. Dickson and Robinson, Old Millgate, Manchester, exhibited four stands containing many good blooms. Commendatory marks of approval taining many good blooms. Commendatory marks of approval were given to all the collections named.

were given to all the collections named.

CUT FLOWERS AND BOUQUETS.—The prize stands of eighteen varieties of stove and greenhouse flowers were excellent. Mr. Faulkner, gardener to J. R. Leyland, Esq., Woolton Hall, and Mr. Mease were placed equal firsts, Mr. Blomiley second, and Mr. H. Elliott third. Mr. Faulkner's stand comprised Allamandas Wardleyans, cathartica, and grandiflora; Tacsonia Van-Volxemi, Ixora coccinea; Lapageria rosea; Miltonia spectabilis, Eucharis, Heliotropee, Clerodendron fallax, Kalosanthes, Stephanotis, Bougainvilleas, Tydeas, Celosia aurea, and Ericas. The most striking of Mr. Mease's flowers were Lapageria alba, Pancratiums, Amaryllis aulica, Dipladenias, Gloxinias, and Pleroma elegans. The best of Mr. Elliott's were Francoa racemosa, American Tuberoses, and Lapagerias. Bouquets were numerous and generally good, but one or two were fully too large and others too crowded. The prizes went as follows:—In the open class for two hand bouquets, first, Messrs. Turner Brothers, Greenhill Nursery, Garston; prizes went as follows:—In the open class for two hand bouquets, first, Messrs. Turner Brothers, Greenhill Nursery, Garston; second, Mr. C. Rylance, Ormskirk; third, Mr. H. Bodsworth, Stone House, Allerton. In the amateurs' class, first, Mr. C. Colebrook, Dingle Head, Liverpool; second, Mr. S. Whitefield; third, Mr. A. R. Cox, gardener to Mr. Watts. For one bridal bouquet, first, Messrs. Turner Brothers; second, Mr. C. Rylance; and Mr. Evans highly commended. Mr. Paul, Paisley, contributed a fine display of Pinks and brilliant stands of Pansies, which were very highly commended by the Ludges, and Mestry Dickson and highly commended by the Judges; and Messrs. Dickson and Robinson, Manchester, staged an attractive collection of hardy cut flowers which were also commended.

As before observed this section of the Show was of great excellence. In the open class, eight dishes of fruit, not more than two varieties of Grapes, first Mr. W. Coleman, gardener to Earl Somers, Eastnor Castle, Ledbury, with Black Hamburgh and Muscat of Alexandria Grapes (very fine), Brown Turkey Figs (very large), Belegarde Peaches, Victory of Bath Melon, Sir Joseph Paxton Strawberries, and Elruge Nectarines. This collection of fruit was very superior, yet very close in point of merit was the second-prize collection of Mr. Jamieson, gardener to the Earl of Crawford, Haigh Hall, Wigan. Duke of Buccleuch Grape in this collection was well grown, the berries even and large, and perhaps this noble Grape has never been exhibited in finer condition. Madresfield Court was also very good; also two dishes of Peaches (Bellegarde and Violette Hâtive), Pine Apple Nectarines, Brown Turkey Figs, and a Queen Pine. Third Mr. J. Bannerman, gardener to Lord Bagot, Blitthfield, with Black Hamburgh and Muscat of Alexandria Grapes, Brown Turkey Figs, Bellegarde Peaches, Trentham Hybrid Melon, Dr. Hogg Strawberries, Pitmaston Orange Nectarines, and a Pine. In the corresponding amateurs' class for six dishes, not more than two varieties of Grapes, Pines excluded:—First Mr. Ferguson, with Black Hamburgh and Golden Champion Grapes (the latter were in good condition), Pitmaston Orange Nectarines, Duc de Malakoff Strawberries, Golden Perfection Melon, and Noblesse Peaches. Second Mr. Elsworthy, gardener to A. B. Gladstone, Esq., Court Hey, Liverpool, with Trentham Hybrid Melon, Bellegarde Peaches (very fine), Figs, Pine Apple Nectarines, and Muscat of Alexandria and Black Hamburgh Grapes.

In the open class for two Pine Apples, first Mr. J. Goodacre. As before observed this section of the Show was of great excel-Grapes.

In the open class for two Pine Apples, first Mr. J. Goodacre, gardener to the Earl of Harrington, Elvaston, Derby; second, Mr. R. Cubbon, Woolton. In the corresponding amateurs' class, first Mr. F. Faulkner, Woolton Hall; second Mr. S. Whitefield, Aigburth.

For four bunches of Grapes (Black Hamburgh and Muscat of

Alexandria excluded), first Mr. J. Ward, gardener to J. H. Oakes, Eeq., Riddings House, with Golden Champion in good coadition, Foster's Seedling, and Muscat Hamburgh, the berries even and the bunch compact; and Madresfield Court. Second Mr. T. Bannerman with Duke of Buccleuch, very good; Black Alicante, Mrs. Pearson, very good, and Madresfield Court. Two bunches of black Grapes (open), first Mr. Ferguson, gardener to T. S. Patterson, Esq., Rock Ferry; second, Mr. Barker, gardener to Alderman Raynes, Rock Ferry; third, Mr. F. Roberts, gardener to W. D. Holt, Esq., West Derby. Amateurs class (two bunches of black Grapes), first Mr. George Washington; second Mr. J. Hurst; third Mr. A. R. Cox. There were fourteen entries in this class, and excellent produce was staged. Two bunches of Muscat of Alexandria (open), first Mr. J. Bannerman, second Mr. Elsworthy, third Mr. Ferguson, the bunches being well finished and of good colour. In the corresponding amateun's class for Muscats, first Mr. Mease with two very fine bunches, the berries being of very large size; second Mr. Ferguson, Rock Ferry; third Mr. Elsworthy. All staging admirable examples of culture.

Peaches and Nectarines.—In the open class for one dish of six fruits, first Mr. S. Whitfield with Teton de Venus, very large; second Mr. Coleman, Eastnor Castle, with Bellegarde, fine, but somewhat deficient in colour; third Mr. Jamieson, Haigh Hall. somewhat deficient in colour; third Mr. Jamieson, Haigh Hall, with Bellegarde. In the corresponding amateurs' class, first Mr. Elaworthy with Bellegarde, very fine and well coloured; second Mr. Evans with Boyal George; third Mr. C. Ford, gardener to T. B. Forward, Esq., Thornton Manor, with Barrington. Nectarines.—In the open class for one dish, first Mr. W. Coleman, Baston Castle, with Elruge Nectarine, excellent; second, Mr. Jamieson, Haigh Hall, with Pine Apple; third, Mr. J. Peers, gardener to R. Raynor, Esq., Wavertree, with Lord Napier. In the corresponding amateurs' class for six fruits, first Mr. Baker, second Mr. Wn. Evans, third Mr. Elsworthy. The competition in these classes was very close, and the fruit was of superior quality. Melons.—For one fruit, first Mr. John Stephenson, gardener to

was very close, and the fruit was of superior quality.

Melons.—For one fruit, first Mr. John Stephenson, gardener to
R. Horsfall, Esq., Grassendale Priory, Liverpool, with Golden
Queen; second, Mr. Wm. Savin with Conqueror of Europe; third
Mr. J. Hales, gardener to Mrs. Frangopulo, Aigburth, with Conqueror of Europe. For one dish of Strawberries.—First Mr.
Mease with James Veitch; second Mr. Evans with Lord Napier;
third Mr. Elsworthy with President. All good. One dish of
Cherries.—First Mr. Elsworthy; second Mr. Mease, and third Mr.
Elliott

VEGETABLES.

In the open class for a collection of twelve varieties, distinct, first, Mr. Goodacre, Elvaston, Derby, with a good collection of first-class vegetables; second, Mr. R. Gore, Huyton; third, Mr. Lermont, West Derby. In the corresponding amateurs' class, first, Mr. Mease; second, Mr. Evans; third, Mr. Bustard, all staging meritorious collections. One brace of Cucumbers.—First, Mr. Evans with Blue Gown; second, Mr. Kinnigan, Huyton. One dish of Tomatoes.—First, Mr. J. Wright, Aigburth; second, Mr. F. Faulkner, Woolton Hall; third, Mr. C. Finnigan. Four dishes of Peas.—First, Mr. Bustard; second, Mr. Evans. A collection of Potatoes.—First, Mr. Mease; second, Mr. Evans; third, Mr. F. Faulkner. Faulkner.

IMPLEMENTS AND APPLIANCES.—Of these there was a considerable display. Messrs. R. Halliday & Co., Middleton, Manchester, had an extensive stand of various garden structures, large chester, had an excensive stand or various garden structure, image and small and of evident usefulness, and were awarded a silver medal. Mr. Joseph Bramham, Dale Street, Liverpool, exhibited wirework as applied to gardening, together with the "Allerton Priory" boiler, and was granted a gold medal. Mr. Joseph Mee, Wood Street, Liverpool, had a similar honour for boilers of various beautiful to the contract of th wood street, hiverpool, and a similar honour for boners of various shapes and sizes and of approved utility; Messrs. Bennett Brothers, Liverpool, a great variety of garden requisites (gold medal); Messrs. Webster of Wavertree sundry good frames and greenhouses; and Mr. Jack's wirework, &c. (silver medals) and Mr. Johnson's teak "pots" were highly commended. Mr. Francis Briggs, Sutton, Chester, exhibited views of rockwork which he has erected with great taste in some of the gardens of the neighbourhood.

Such was the first Show of the Liverpool Horticultural Association that was only suggested last autumn and fairly established tion that was only suggested last autumn and fairly established this year. It was originated by the gardeners of the district, who felt that if they worked willingly and unitedly shows worthy of the town might be produced, superior cultivation promoted, and a wider interest in horticultural pursuits created. The first Show—as real gardeners' show—has been a greater success than the most sanguine anticipated, and with harmony of action in the future and a wider scope given to the operations of the Association, still larger exhibitions will be produced. The Association has been wholly managed by gardeners, Mr. Faulkner of Woolton Hall Gardens being the Chairman, and Mr. Bardney of Norris Green the Vice-Chairman of the Committee. Two hundred gardeners are subscribing members, and generous support has been given by the nobility and gentry of the district. The directorate given by the nobility and gentry of the district. The directorate has proved worthy of that support, and by the prudence that has been exercised in the management merits such further assistance

as will place Liverpool horticalturally in a higher position than has yet been attained by that wealthy and important town. As evidence of the care that has been exercised by the Commistee, it is pleasurable to state that the success of the Show did not depend ensirely on fine days, as sufficient funds were secured to pay the prises and meet all expenses without relying on the gate money; so that what was taken on the two fine days will, with increasing subscriptions that will no doubt follow, enable better prizes and an extended schedule being prepared for another year. With such distinguished patrons as the Earl of Derby, the Earl of Sefton, and Colonel J. Ireland Blackburne, M.P., and with the Mayor of Liverpool as President and an influential list of Vice-Presidents; with a member of the firm of Baring Brothers (W. B. Halhed, Esq.) as Treasurer, and sound practical management, the Liverpool Horticultural Association can scarcely fail to become firmly established and to exercise a wholesome influence on the horticulture of the district, as it will provide the public with a means of enjoyment at ence salutary and instructive, and quite in harmony with the beautiful park which the Corporation has provided for the town. The prize money was paid at the close of the Exhibition.

HARDY HERBACEOUS PLANTS.

A SEASON like the present so inimical to ordinary bedding plants is beneficial to well-arranged borders of hardy plants. The one particular point to be guarded against is to eachew all attempts at forming large collections of distinct species. This may be very interesting employment, but it is not the way to make the borders gay and useful. I lately had the pleasure of inspecting a large collection in course of formation by a private gentleman, and found numbers of plants, interesting and beautiful as individuals, but taking the effect of the garden as a whole it was to any ordinary observer very unsatisfactory; in fact there was no attempt at planting for effect, the sole aim of the owner apparently being to obtain the greatest number of species. Gardeners who want to please their employers must plant their borders with a selection of the best plants only, having at all seasons sufficient to insure an effective display spring, summer, and autumn. We have in the kitchen garden some 300 yards run of these borders, and at the present time these are rendered very effective by dozens of clumps of double Pyrethrums, Campanula glomerata, a grand plant, though common; Lychnis dioica flore-pleno, Geranium Endressii, Lupinus polyphyllus in variety from seed, English and Spanish Irises. Dwarfer plants which give a character to the front rows consist of clumps of Pansies, Dianthus plumarius flore-pleno. Achillea aurea, Campanula turbinata, and various single specimens of species which bloom now. There are also various tall-growing plants in the back rows, which render the collection growing plants in the back rows, which render the collection varied and interesting. Roses are coming on to take the place of these. Phloxes, in the best varieties closely planted; Campanulas, varieties of persicifolia; C. grandis, a fine old plant; Pinks, Picotees, and Carnations of the Clove section; late-flowering annuals sown to fill up the gaps left by the decayed foliage of Crocuses, Snowdrops, Narcissuses, Scillas, Sanguinaria canadensis, Anemones, Sisyrinchium grandiflorum, and other early-flowering bulbous plants which have done their part earlier in the year. Later on Tritomas Michaelmas part earlier in the year. Later on Tritomas, Michaelmas, Daisies in many varieties, Japanese Anemones, Sunflowers, East Lothian Stocks, &c., keep the border gay until the approach

of winter puts an end to their beauty.

In the flower garden is a mixed border about 100 yards in length planted for effect mostly in spring and autumn. This border is not strictly devoted to hardy herbaceous plants, as in this we have old plants of Geraniums in conjunction with Calceolarias, Pentstemons, Asters, Gladiolus, Salvias, the best annuals, &c., mixed with Tritomas, Phloxes, Agapanthus umbeliatus, Roses, Arabis, Irises, &c. In the kitchen garden borders annuals are being dispensed with as much as possible, as these do not grow satisfactorily in borders where the permanent plants render it necessary to disturb the ground as little as possible. It is intended to re-arrange these borders this autumn, when a sufficient number of perennial plants will be

planted to almost fill the borders.

In the keeping of borders of permanent hardy plants there is far more labour required than is generally supposed. As a matter of fact from April to November unceasing attention is seessary to keep them in good order. There is staking or ting off withered blooms, or putting a limit to some aggresplant intent on smothering a lowly neighbour. Besides feutine work, in order to have the plants strong and floritheyery third year the border will require overhauling and the lifted, the border manured and dug or trenched, and divided where necessary, re-arranged and planted.

In "spring gardening" as everybody is aware, hardy flowers furnish the plants necessary for making a display at that season. Later in the year none of these have the brilliancy of Pelargoniums, combined with their dwarf habit and continued floriferousness; neither have we in any hardy plant the rich leaf-colouring such as is found in Coleuses and Althernantheras, but in extensive gardens a change to softer shades is not only allowable but commendable. In two borders planted for a late display we have a centre of Tritomas, a band of bedding Dahlias, another band of the soft Sedum spectabile, and an edging of the elegant Dactylis glomerata. Descending to more lowly subjects we have had a large circular border carpeted with Veronica pectinata, with scrolls formed with Golden Feather Pyrethrum and Oxalis tropecoloides, the relieving plants being Centaurea ragusina or Chamæpeuce diacantha, Sedum elegans edging the whole design. Another bed which we have not been allowed to change has a large Sweet Bay for a centre, with Sedum latifolium atropurpureum round it; the main body of the bed being the golden-variegated Thymus citriodorus, with a broad band of Santolina incana as an edging. A large round bed we have filled with Roses pegged down, carpeted with Violas and edged with the pretty white variety of Campanula pumila. At present this edging is very beautiful. Hardy plants are also employed in combination with tenderflowering and foliage plants, as also in combination where both are employed. As is the case with mixed borders so with these in beds, a great amount of attention is requisite to keep them in thorough condition, the gain as regards their requiring less work being comparatively slight.

Of course in these days, when it takes a dozen plants to the square foot, any relief to the propagating department in spring is an advantage; but on the whole I would not so much recommend a large number of these hardy subjects to be grown on that account, as because of their own intrinsic merits, which are not the slightest amongst cultivated plants. The man who can see his way to employing permanent plants to a greater or less extent in flower beds or borders will be wise to do so.—

R. P. B.

ROSES.

I CANNOT agree with "A. C." that Duc de Wellington is the same or so much the same as Fisher Holmes as to be a synonym. In three places in my garden I have the two plants planted together. I often place Roses much alike together to compare them, and on the whole Fisher Holmes is more like Charles Lefebvre or Marguerite Brassac than Duc de Wellington, which is both brighter in the outer petal and deeper and more concentrated in colour than Fisher Holmes. I wonder more persons do not grow Madame Caillat, it is splendid with me this year.

In your remarks on Manchester it was suggested that Messrs. Paul & Son ran a close contest in the seventy-twos. I thought so at first as theirs were in a better light, but on taking the points accurately there was not the least doubt Mr. Cant was far ahead, and the second was also many points above Messrs. Pauls', who had spoilt their stand by some very coarse and overgrown blooms in the back row. Considering the short time allowed to the Judges, I was thankful I had two such good men to assist as Messrs. Jowitt and Soames.—C. P. P.

ACANTHACEOUS PLANTS FOR WINTER FLOWERING.—No. 2. BELOPERONE.

A GENUS containing many beautiful species; some of the finest, however, have not yet reached us as living plants. It is distinguished by a five-cleft calyx, the lower portion being three-lobed and most conspicuous, the upper portion concave; the stamens, two in number, are inserted in the tube of the corolla, and the anthers spurred at the base; stigma awlshaped; ovary two-celled, with two ovules in each cell. All are natives of South America, and require to be grown in an ordinary stove temperature. The soil should consist of leaf soil, peat, sand, and loam well incorporated, and abundance of water must be provided whilst the plants are growing actively.

B. cilista.—A handsome slender-growing plant of great beauty, attaining a height of about 2 feet, its free-branching habit being very favourable to the production of good specimens. The leaves are some 2 to 3 inches long, ovate lanceolate in shape, deep green above, paler below. Flowers pro-

duced in terminal fascicles in great profusion; colour purplish violet, the base of the lower portion of the corolla white. It comes into flower during the months of November and December. Native of Venezuela, &c.

B. violaces.—A plant of similar habit to the preceding, but not such a free-branching species. Leaves about 3 inches long,

broadly ovate acuminate, and deep green. Flowers produced in large terminal faccicles; colour soft violet. It blooms during midwinter. Tropical America.

LANEESTERIA.

This is a small genus of the order, the species here named

being as far as we are aware the only one in cultivation. The being as far as we are aware the only one in cultivation. The soil should consist of loam and leaf mould in about equal parts. With a small portion of sand. In this compost we have found it thrive better than when peat mould is used. Being a native of West Tropical Africa it delights in strong moist heat.

L. Barteri (fig. 13).—Named in honour of the indefatigable but ill-fated traveller attached to Dr. Baikie's last Niger expedition. It is a bold-growing plant with large, opposite, oblong

lanceolate, acuminate, dark green leaves. Flowers produced is great profusion on long terminal axillary spikes; colour rich gamboge yellow, with orange centre. It flowers at the end autumn and beginning of winter. Native of West Africa.

It is a remarkable fact that all the known speci-cich

spears to be a native of West Africa, having been sent from lance by Dr. Baikie when on his last Niger expedition, and in besour of whom it is named. It is a strong-growing plant, will deserving a place in every stove for the brightness of its namerous flowers and the long time it maintains a display though the winter months. Culture same as Lankesteria.

S. Baikiei (fig. 14).—A suffruticese plant, attaining a height of 2 to 3 feet or more; less rapid in its growth than many plants of this order, and we would therefore advise the plants to be grown a second year. Leaves opposite, 4 to 5 inches long, ovate lanceolate in shape, light green. Flowers produced in large terminal panicles; corolla tubular with a recurved

limb, upwards of 2 inches long, reddish scarlet in colour. It blooms during the whole winter. Native of West Africa.

DICENTRANTHERA.

Of the distinguishing characters of this genus we have no knowledge; as far as our experience goes it is the only species, and also very rare, at present in cultivation. It is a bold-growing plant, attaining a height of some 6 to 8 feet or more in its

native habitat, but fortunately it produces its flowers freely long before it reaches these dimensions. Being such a strong grower it should be potted in a beavier compost than is usually done with plants of this order, say about two parts loam and one part each of leaf mould, peat, and sand.

D. macrophylla.—A bold handsome plant. Leaves somewhat ovate lanceolate or obovate with undulate margins, about 1 foot

long, deep rosy purple, internally white, produced upon erect terminal spikes about the same length as the leaves. It blooms in midwinter. Native of Fernando Po and various parts of West Africa.

FRUIT PROSPECTS.

FROM several reports received from numerous places in Durham and Northumberland of the fruit crops this year, it may be generally said that all small fruits are up to or were above the ordinary average, whilst Strawberries seem to be very prolific indeed; but slugs are sadly interfering with them, and as yet very small quantities of fruit have been gathered, which have principally consisted of Black Prince. been an almost entire absence of sun, while rain has fallen more or less every day. All wall fruits are generally thin, Plums or less every day. perhaps being best; but Peaches, Pears, and Apricots will not be near an average. It may be a fact worthy of notice here that in some cases where Peaches on walls have received no protection they are bearing the best crops. This is certainly the case at Axwell Park, and to a certain extent fully verifies your correspondent Mr. Witherspoon, when he stated in your columns that a Peach was as hardy as a Pear. Apples, Pears, and Plums on standards and pyramids are also very inferior, although better prospects as regards bloom were never finer, and at the same time the season being so late, it was considered of great advantage to the north; but the humid and wet state of the atmosphere must have had much to do with the failure.

The above observations may be said, with few exceptions, to represent the state of the fruit crops in the two counties, and one of the exceptions is Holeyn Hall; for Mr. Cook there has an excellent crop both of wall fruit, small bush fruit, and fruit on standards, small pyramids, &c., as some of the Pears and Plums on the wall be has had to thin. Early vegetables have been fully a month and six weeks late. In some instances Peas have been two months in bloom. We grow here William I. for our early Pea, but do not consider it the earliest one, the true Dillistone being earlier; but William I. is more productive, and therefore we do not mind waiting a few days longer, and this year it has just grown with us twice its height—viz., 7 feet.—B. COWAN.

ROSE SHOW AT BEBINGTON.

The first Exhibition of the Wirral Rose Society was held on July 29th in a tent erected in the Mayer Library Grounds, Lower Bebington. As an attempt to gauge the number and enthusiasm of local Rose-crowers the success of the experiment must have proved very gratifying. For the silver cup of the Society, twenty-four cut blooms, distinct varieties, there were five entries. There were no fewer than sixteen competitors in the next class, twenty-four varieties of cut blooms (money prizes); seventeen entries in that of six varieties; sixteen in that of three varieties; ten in the single cut bloom, Hybrid Perpetual class; and seven in the one cut bloom, Tea or Noisette class. In the last class, open to all comers, nurserymen and growers for sale included, seventy-two distinct varieties of cut blooms, there were but two competitors, the explanation being the great difficulty, except to the most extensive cultivators, of securing so large a number of show blooms. The condition practically amounted to the exclusion of all nurserymen in the district. This, however, can hardly be regretted in one sense, as the result demonstrated the wealth of material existing among the resident gentlemen amateur class of growers, and their commendable spirit of rivalry. If such a show as that of Saturday could be got together in spite of the difficulties attending a first effort, and positively the worst season on record, what a glorious future the Society has before it!

We believe it owes its existence to a few earnest rosarians, who, having themselves realised the pleasures of the pursuit, were desirous of extending a knowledge of, and giving an impetus to, the practice of so delightful an art. This is the reason why the Society is made to embrace the extensive hundred of Wirral; but its locale could not have been more fittingly chosen than at Bebington, which seems indeed the very home of the queen of flowers. Every cottage has its Gloire de Dijon or its Général Jacqueminot, while the proprietors of some of the neighbouring villas literally number their trees by the thousand. Happily it requires no elaborate training, or technical knowledge, or especially fine taste, to grow and thoroughly appreciate a beautiful Rose. One of the most successful of Saturday's exhibitors is a gentleman who, it is said, does all his flower gardening himself, and whose pleasure ground is as admirable for its trimness and order as for being bright with flowers. For uniformity of excellence in so large a number, as might be expected, the palm must be awarded to the two collections of seventy-two each exhibited

by Messrs. James Dickson & Co., first prize, and Messrs. F. & A. Dickson & Sons, second. Still, scarcely any diminution of excellence was observable in the magnificent array of twenty-four blooms sent by Mr. T. B. Hall, Larchwood, which carried off the Society's silver cup. This splendid collection included Marie Baumann, La France, Paul Neyron. Charles Lefebvre, Marquise de Castellane, Dapuy-Jamain, Mdlle. Eugenie Verdier, Thomas Mills, Monte Christo, John Hopper, Abel Carrière, Dr. Andry, Baronne de Rothschild, Prince Camille de Rohan, Etienne Levet, Madame Hausmann, Hippolyte Jamain, Princess Louise Victoria, Souvenir de Charles Montault, Alfred Colomb, Impératrice Eugénie, Sir Garnet Wolseley, Souvenir de la Malmaison, and Thomas Methven. The twenty-four Roses exhibited by Mr. William Just, Eastham, which secured first honours in Class 2, made up a wonderfully fine collection, and are equally worthy of being named individually. They were Magna Charta, Marquise de Castellane, Thomas Mills, Elie Morel, Comtesse d'Oxford, Madame Nachury, Anna de Diesbach, John Hopper, Charles Lefebvre, Marquise de Mortemart, Dr. Andry, Capitaine Christy, Etienne Levet, Madame Clemence Joigneaux, Madame A. Rothschild, Duc de Rohan, Boule de Neige, General Washington, Madame C. Wood, La France, President Willermoz, Gloire de Dijon, Prince Camille de Rohan, and François Michelon. Generally speaking there was a paucity of yellow Roses, those shown including Maréchal Niel, Belle Lyonnaise, Céline Forestier, Climbing Devoniensis (an exquisite specimen), and Narcisse. Among the whites the purity of Baronne Maynard was especially striking. Souvenir de la Malmaison, with its delicate flesh tint and grand habit, was well represented. The pink section, of which La France and Baronne de Rothschild may be taken as types, were very plentiful. Bright reds, vermilions, crimsons, carmines, purples, were in almost endless variety; and the rich profusion of dark velvety flowers indicated the general estimation in which they are held. It required

There were one or two glaring cases of error in naming. Perhaps, also, a little more attention to correctness in the spelling might have been reasonably expected, seeing that the cottager class was entirely absent, and the ease with which authorities can be referred to. By-the-by, would it not be advisable to admit exhibits from cottage gardens at the next Show? There is no such thing as monopoly in the culture of Roses, and the much-coveted "Yellow Moss" may some day turn up in a lowly garden, just as the White Bath Moss and the Unique were discovered.

Mr. Dowie (Hoylake) and Mr. Elliott, gardener to Mr. W. G. Bateson, New Heys, Allerton, were the Judges.

STRAWBERRIES.

THE season is now sufficiently advanced to enable me to speak with some certainty with regard to the crop—at all events in my own garden. I had a fair crop of Early Prolific, also of Keens' Seedling, a large one of Vicomtesse Héricart de Thury, rather a poor one of Sir Joseph Paxton and President; but the best crop of all was Myatt's Prolific alias Wonderful, which I grow in a double line as an edging. This unusual season suited this Strawberry very well. The crop was very large, and in places the fruit so crowded together that it would not have ripened if I had not placed forked sticks to support the fruit stems and keep them separated from one another. I do not consider this a first-rate Strawberry, but it was very useful this year when some of the others were less abundant than usual, and not being in a bed they dried more quickly.

I was glad to see your correspondent Mr. Laxton gives so good an account of Keens' Seedling and Sir Joseph Paxton, for these are two Strawberries which I have recommended as being two of the best in cultivation, and so they undoubtedly are in this district. Some people have discarded Keens' Seedling because the fruit is small after the first picking, but I think they have acted very unwisely if it thrives on their ground, and that is the only reason, for I obtain a larger weight of fruit from plants occupying the same space of ground than any other, and it renders me almost independent of the season. Sir Joseph Paxton has not done as well with me as last year. It ripens slowly, and there was an unusual number of mouldy berries, but that has been a common complaint with many varieties this year. I gave some liquid manure to one bed of Sir Joseph Paxton this spring, and I am sure it did more harm than good by encouraging the growth of too many leaves. I do not know that I shall try the experiment again. My Strawberries are well manured in November, and I think that is all they require. I have been trying three varieties lately which I have not had before—Lucas, Amateur,

and Souvenir de Kieff. They are all good, but I do not require them, although I think of continuing the first a little longer,

as it is so well spoken of.

With regard to some of the later varieties, Frogmore Pine is not later than Sir Joseph Paxton, or I had the wrong variety sent me, and Eleanor is a great failure. I have grown it three years and never had half a crop. It is much inferior to the Liton Pine, and will not be continued. The varieties I recommend for this district are Roden's Early Prolific, Keens' Seeding, Sir Joseph Paxton, President, La Constante, Myatt's Prolific as an edging, and Elton Pine. The above are all I want except some others for preserving. The complaint is that they are too good and the preserve too rich. Some were tried in Red Currant juice and made an excellent preserve, but tasted rather too much of the Currant. Vicomtesse Héricart de Thury I am trying this year, and think of procuring Rivers's Eliza. Perhaps some of your readers can recommend a few more that are fair croppers and a little brisk in flavour. For soils where Sir Joseph Paxton and President are apt to run too much to leaf I should recommend Early Prolific, Sir Harry, Amateur, and La Constante. My method of cultivation is very similar to that of Rev. C. P. Peach, except that in droughty seasons I do not cut any ranners off the late varieties.—

ON CIRCUIT.

WHILE Her Majesty's most honourable Judges are scouring the country, and Chief Justices, Chief Baron, Puisse Judges, and by whatever name they may be called, are to be found in every assize town in the kingdom, there are some of us who, although we have not attained the ermine or even the silk, have been engaged in a pursuit which, bearing the same name, yet exercises itself in a very different way. Before us are brought no beetle-browed ruffians, no slattern drabs on whose face crime has left its mark. We have to put on no black cap to condemn the wretched prisoners to the gallows or sentence them to penal servitude. We are judges, but I flatter myself we bear a greater similitude to Paris than to Judge Jefferies, and instead of holding a bloody assize we hold the golden Apple, and have to adjudge it in accordance with its inscrip-tion, "Detur pulchriori." True we have some criminals at times, as for instance when an impostor calling himself Rev. H. D'Ombrain was placed amongst a set of lovely dames, as if he belonged to the refined family of the Teas, when punish-ment had to be meted out to him. We are, indeed, sometimes obliged to complain of even high-titled ladies that they are faded or dirty (imagine our impudence)! but that is all. we are not obliged to listen to Mr. Serjeant Buzfuz, or his dear brother Mr. Serjeant Fuzbuz, as they so beautifully argue that black is white. No, our judgment is carried forward in silence and quiet. We allow each candidate to show themselves off to the best of their ability, and so give fair play to all. Well, I have been lately on circuit in this capacity, and as the places where the assizes have been held have before now been noticed in the Journal it may be of interest if I record my experiences.

NEWTON STEWART.

It is now four years since, yielding to the earnest request of a brother parson who is now in Ceylon, and who, I hope, is not included in Heber's line, "Where only man is vile," I journeyed to this somewhat out-of-the-way place, but which, notwithstanding, is the only one so far as I know where exhibitors from the three kingdoms have exhibited together, with the exception of Helensburgh, in the same part of the world. The ready access to the north of Ireland by Stranraer enables those very successful growers the Mesers. Diokson of Newtonards to compete, while in former years Mesers. Cant, Paul, and Cranston have entered the lists. The Scotch nurserymen are at home, so that the Shamrock, Rose, and Thistle can meet together in the same friendly contest. Like all Bose shows this year it has shown the evidence of the severe and trying season we have passed through—so severe in the north of Ireland that in that district, usually so free from severe weather, not only had they thirteen weeks in winter during which they were unable to put a spade into the ground, but in the middle of June, as Mr. Dickson informed me, the carts coming met Newtonards were covered up to their axles in hail, that all the foliage was cut off the Roses, and even the Potatoes were left with only the ribs of the leaves showing. All who know Ireland know how exceptional this is, and all Bose-growers will estimate the difficulty of coming up to one's usual form in such a case, and yet a most beautiful stand was shown by them, gaining the first price and the National Society's silver medal. Mesers. Dickson staged their flowers in painted and highly varnished stands, such as are used for Dahlias, and elevated above the stand a few inches,

and to my mind this is preferable to moss provided it suits the flowers as well. Moss is not always presentable, and I cannot say that dyed wool, as we have seen it this year, is any improvement; whereas the bright green stand is always fresh and neat. Not being an exhibitor I cannot say how they would stand as to colour, &c., but I am bound to acknowledge as shown by Messrs. Dickson they were exceedingly elegant and good. Amongst the varieties exhibited by them were Alfred Colomb, Xavier Olibo, Mons. Noman, Ferdinand de Lesseps, La France, very fine; Mrs. George Paul. Marguerite de St. Amand, Duc de Wellington, very good; Mons. E. Y. Teas, fine; Etienne Levet, Horace Vernet, Marie Baumann, very good; Baronne de Rothschild, Constantine Fretiakoff, Richard Laxton, very fine; Comtesse de Murinais, Earl of Beaconsfield (Bennett) very good. Constantine Fretiakoff is like Comtesse d'Oxford, but perhaps an improvement on that popular flower. Lord Beaconsfield was good. It is a seedling introduced by Mr. Bennett of Salisbury, but not one of his own raising. Mr. Smith of Stranraer was second in this class, with blooms inferior indeed to Mr. Dickson's, but greatly in advance of his exhibits of four years ago. Amongst his blooms were Duc de Wellington, Thomas Mills, always good in this climate; Mons. E. Y. Teas, very fine; Louis Van Houtte, Penelope Mayo, of fine form and good colour; Richard Wallace, John Fraser, a Rose I have not seen for years, and it is often thus in these provincial exhibitions one comes across some neglected or forgotten Rose, making one question whether it had been justly condemned; Sultan of Zanzibar, which has been shown very good this year, but too like Reynolds Hole in colour; Maréchal Vaillant, Camille Bernardin, Fisher Holmes, very like Duc de Wellington, and Charles Lefebvre. The same exhibitor occupied similar positions in twelve Teas and Noisettes. Mr. Dickson's stand contained, Madame Willermoz, Maréchal Neil, Madame Miolan Carvalho, a seedling from Cloth of Gold, somewhat deeper in colo

good form. It is also said to be a good grower.

Passing now to the amateurs, there was a manifest improvement in the greater number of the Roses, notwithstanding the season; and by amateurs I mean not growers for sale, as there is a distinction made between the gardeners of private gentlemen and amateurs who do not keep a regular gardener. Mr. Kirk exhibited an excellent twenty-four, obtaining first prize and the National Society's bronze medal, in which were fine blooms of La France, Louisa Wood, Princeas Mary of Cambridge, Etienne Levet, Charles Lefebvre, Annie Laxton, Sultan of Zanzibar, Duc de Wellington, Duke of Edinburgh, Catherine Mermet, Dupuy-Jamain, and other well-known kinds; and Mr. McMorren amongst those strictly amateurs exhibited some fine blooms. One class here I have seen advocated for general adoption—viz., sweet-seented Roses, but my experience is not favourable. I should have disqualified all but one stand; but when I was assured that Souvenir de la Malmaison was a perfumed Rose it was clear to me that noses are not all of the same pattern even as to their olfactory nerves. The Society has made such good progress, has thrown itself so thoroughly into the endeavour to secure a good Show and to diffuse a taste for Roses, that it is a pity anything should fall short in it; and therefore I hope and believe that it will no longer tolerate the addition of foliage, which it now permits. To see Tea-scented Roses surrounded by Hybrid Perpetual foliage is not a pleasant sight, and as I have said it is doomed here, in the last place in which I know

the rule to exist.

I must reserve Helensburgh and Leek for my next paper, only adding that the same kind and cordial greeting I have ever had here was no way diminished, and everything was done to make my short sojourn an agreeable one.—D., Deal.

LIQUID MANURE FOR FORCED STRAWBERRIES.

Under the above heading "An Old Grower" says (page 65), that "no stimulant acts more promptly than water in which a little nitrate of soda has been dissolved." This is worth repeating half a dosen times a year, until every reader of the Journal who cultivates Strawberries has it impressed on his memory. We have tried it again and again on Strawberries in pots and in quarters, and it is most effectual in swelling-off fine berries.

Last year our employer condemned a bed of Strawberry plants which had done good service for eight years running! The reason was that the plants were exhausted. Now we do not believe in Strawberry plants getting exhausted so long as they can find their proper food; but if that is not to hand of course the plants will fail. We wished to experiment on the old plants, for we were loth to dig them up, as we have always much trouble in obtaining a young plantation in proper form. We asked a year's respite for the plantation, and a few pounds of nitrate of sods, and prophesied (from past experience) re-

newed vigour to the old plants. We obtained our request, so [in September last year we gave a good top-dressing of decomposed manure as usual. Our soil is thin—8 inches—and miserably poor and stony, and an annual top-dressing is necessary. During winter the ground was soaked with cow's urine, also an annual process with us which we find of great benefit. In April we sprinkled between the rows a good dressing of nitrate of sods, and now (July 26th) the old plants are extremely robust, and carrying such a profusion of vigorous stalks bearing clusters of such berries as we believe was never seen before in the garden. The variety is Garibaldi (Vicom-tesse Héricart de Thury). We left 1½ foot between the rows to give plenty of room for straw, and over this space the stalks are reaching and interplaiting with those of the neighbouring row, and are so borne to the ground that we were obliged to run cord along each side, supported every 2 feet or so by sticks, to prevent them lying in heaps on the ground. Oh! for sun to ripen them, and oh! that the rain might cease! "The rain all; but that is everybody's cry.

Before closing it might be worth while directing attention to

the fact that the ash of Strawberries (the fruit) contains as much as 27 per cent of soda and 21 per cent of potash. Horse droppings, which your correspondent "OLD GROWER" stacks with his loam to make it rich, afford only 2 per cent., and of potash something like 11 per cent.; hence the beneficial action of nitrate of sods. Guano does not afford much more sods than horse droppings; and as for potash, it ought to be known that of the whole manurial matter in cow urine 24 per cent. consists of potash salts. As for bones, they afford neither potash nor soda, but are still very good in an ordinary compost; and the stacking of loam with horse droppings, as advised by "OLD GROWER," is also a capital plan for getting ordinary loam into a fine potting condition. A good soaking of cow urine applied to the loam stack further improves it, and such prepared loam is capital for growing-on Strawberry plants or, indeed, any loam-loving plant, but sometimes further aid is necessary before perfection is attained. Observation, experience (that of others as well as our own), science—what an amount of

delight these throw on the commonest everyday occupation!

It is well when we read attentively and aright the lessons which lie in a handful of salt, a potful of loam, a spadeful of manure, or a square foot of atmospheric air. Speaking of salt reminds us that we have noticed very good results from a principal of this contract. sprinkling of this on Strawberry beds, especially when accompanied by a soaking of diluted cow urine.—SINGLE-HANDED.

PIE CRUSTS.—Resolution of the National Rose Society:-"That the Society discountenance by every means in its power the holding of two-days Rose shows." Result—That in the present year, the President and many members of the Committee who passed this resolution have not only competed at Norwich, a two-days show, but have done their best to resuscitate the Birmingham Show on the same objectionable basis. If all the Society's resolutions are to be treated in the same manner, may not we suppose they were made to be broken?—VERY MUCH PERPLEXED.

NOTES AND GLEANINGS.

THE number of persons who paid for admission to THE BOYAL HORTICULTURAL SOCIETY'S GARDENS on Bank Holiday, August 4th, was 11,342 at 2d. = £94 10s. 4d.

— The STORM on Saturday night and Sunday morning produced some disastrous effects in the west of London, particularly in the neighbourhood of Kew and Richmond. The unusually heavy rain was accompanied by hail of great size, some of the hailstones having been found to be 5 inches in circum-ference. The houses in Kew Gardens have suffered severely, apwards of 16,000 squares of glass having been broken, and many of the plants are damaged, and in consequence the houses have been closed since Sunday. The nurserymen and market growers of the neighbourhood have also had a great quantity of glass destroyed, and the storm is stated to have been one of the most severe ever witnessed in the locality. The Royal Horticultural Society's Gardens at Chiswick escaped with comparative immunity, only about 300 squares of glass being broken. Much damage was done in the neighbourhood of Reigate. At Wray Park (Mr. Simpson's) the injury was very serious; at Sunnyside (Mrs. Farquahar's) upwards of a thousand squares of glass were broken; at Great Doods (Mr. Water-

low's) 1200. Trees were stripped of their leaves, while fruit, such as Apples, Pears, and Gooseberries were to be seen the next morning strewed about at every step. Some of the hailstones exceeded 31 inches in circumference.

MR. J. WITHERSPOON writes to us concerning the absence of the lower leaves on VINE LATERALS as follows:have an idea this singularity is simply the result of scalded leaves being removed after the sun has caught some young hand napping."

THE same correspondent writes in reference to the FRUIT CROP-"Between trees killed right out and some varieties heavily laden I have some in every condition, but after a close examination of the fruit spurs I find none without evidence of last winter's severity."

GREAT excitement was caused in the neighbourhood of Mallow in Ireland last week by the reported appearance of the COLORADO BEETLE. A specimen of the insect was for-warded to us, and it proved to be the harmless Pentatoma dissimilis.

Among the Orchids at Smeaton Gardens near East Linton, N.B., there are at present some splendid specimens of Stanhopeas in flower. These consist of large plants in wire baskets of S. tigrina with several spikes each; S. oculata, also with several spikes. S. insignis and S. Martiana are showing for flower later on. Numerous pieces of the beautiful Miltonia spectabilis are coming into flower, not one here and there spectabilis are coming into flower, not one here and there over the plants, but these will be covered with flowers; the largest specimen is some 3 feet across. There are also remarkable specimens of the following good old species—Cattleys Skinneri, 4 feet through; Aërides odoratum, 5 feet through; Dendrobium densiflorum, 3 feet through; Cattleya crispa in varieties, and some extra large specimens, the finest being a plant of C. c. intermedia rosea; C. Mossiæ is grown in many varieties; C. Acklandiæ, some 2 feet through. Such good old kinds as Zygopetalum Mackayi, Lycaste Harrisoni, Oncidium sphacelatum, Lælia anceps, and Calanthe veratrifolia are represented by extra large specimens. Of plants of later introduction there are many good healthy pieces of Saccolabium, Aërides, Phalænopsis Schilleriana, Renanthera coccinea, Cologynes, Oncidiums, &c., which only require time to be as large as some of the older species are now. Mr. Black regards the as some of the older species are now. Mr. Black regards the Orchids as his own particular charge; he pots them, waters them, and attends to all their wants himself; hence, no doubt, the grand old plants which make one envious. Besides the Orchids there will be in a few weeks a fine display of Yucca gloriosa in flower. Many of the plants are throwing strong spikes up just now.

WE recently noticed an instance of the manner in which shelter prevents the BLISTER AND CURL OF PRACH LEAVES. Young trees planted in an open nursery have their leaves and shoots seriously affected; but a short distance from them is a large space of ground surrounded by large Yew hedges, and there the growth of the Peaches was remarkably clean and vigorous, and presented a striking contrast with those first noticed. This must be entirely due to protection from cold winds provided by the hedges, as the soil and other

conditions are precisely similar.

— MR. G. EASTON, late gardener to M. R. Smith Esq., Heathlands, Wimbledon, has been appointed gardener to C. R. Hodgson, Esq., Copt Hall, Mill Hill, Hendon; and Ms. JAMES BURDEN, gardener to D. B. Chapman Esq., Downshire House, Rochampton, succeeds Mr. Pocock as gardener to E. Saunders, Esq., Fairlawn, Wimbledon, S.W.

—— In the gardens attached to Mr. Brunlee's residence on Wimbledon Common we lately saw some remarkably strongly grown Delphiniums. Several were quite 9 feet in height, and with stems like Hollyhocks. The plants were very stately and beautiful.

THE following PLANTS in the unique collection of the Right Hon. Sir William Hutt, Appley Towers (described on page 350, vol. xxxv.) have succumbed to the severity of the past winter—The Guava tree, Tree Ferns, Araucaria excess, Brugmansias, Correas, Eriostemons, Acacias, Hakeas, Casuarinas, and small plants of Eucalyptuses. Some of the more rmas, and sman piants of Eucarypruses. Some of the more noticeable that have passed the winter in comparative safety are Abelia floribunda, Acacia armata, A. dealbata, A. longifolia magnifica, Agapanthus umbellatus, Akebia quinata, Aralia Sieboldii, A. papyrifera, Araucaria braziliensis, A. Cookii, Arundo Donax variegata, Azalea indica, Berberidopsis corallina, Bignonia grandiflora, Calceolaria violacea, Clethra arborea,

Coronilla glauca, Clianthus puniceus magnificus, Choisya ternata, Chamærops excelsa, C. Fortunei, Desfontainea spinosa, Desmodium penduliflorum, Dracæna australis, Dasylirion sp., Eleagnus japonicus variegatus, E. Sieboldii aureo-variegatus, Embothrium coccineum, Eurya latifolia variegata, Eucalyptus amygdalina, E. globulus, E. marginata, and three other species. Fabiana imbricata, Grevillea rosmarinifolia, Illicium religiosum, lagerstræmis indica, Lomatia heterophylla, Leptospermum lanigerum, Metrosideros floribunda, Lapageria rosea, L. alba, Nerium Oleander, Thea viridis, T. bohea, Stauntonia latifolia, Swammerdamia antennaria, Rhynchospermum jasminoides, Pittosporum Tobira, Aloysia citriodora, Olea species, Azara dentata, and Escallonias in variety.

— THE Rev. George Henslow, F.L.S., has just published the "STUDENT'S CATALOGUE OF BRITISH PLANTS." It is arranged according to Sir J. D. Hooker's "Student's Flora of the British Isles," and will be found extremely useful to those who are prosecuting this branch of botanical study. It forms a pamphlet of forty-four pages, and is printed in a bold clear type. It may be obtained by post of Bateman, High Street, Portland Town, on forwarding 1s. 6d. in postage stamps.

In the GREENHOUSE at Kew several attractive plants are now flowering. Bignonia speciosa, a native of Uruguay, is bearing numerous delicate pale purple flowers, which appear very pretty hanging from the roof. Rhodochiton volubile, another climber, is at its best. The flowers are very abundant; the calyx is campanulate, purplish pink; the corolla tubular and dark maroon-coloured—a very curious contrast. Datura Knightii and D. sanguinea are bearing several of their large trumpet-shaped flowers. The general appearance of this house is now very bright and fresh.

MR. ALLIS, writing to us from Old Warden, Beds, states that a SEVERE THUNDERSTORM passed over there on the evening of the 2nd and early morning of the 3rd inst., and continued for three or four hours. The lightning was unusually vivid and continuous, with very heavy peals of thunder. The rain fell in torrents; $2\frac{1}{2}$ inches fell during the storm. Low-lying districts are very much flooded, and much hay is swept away. Several trees were struck by lightning, and some were smouldering the following day. Game has been killed, fish ponds overflowed their banks and the fish washed away; many Potatoes were washed out of the ground, and the injury done to gardens generally is very great.

AN entomological correspondent sends us the following relative to the ENEMIES OF THE PEA:—In the current number of the "Entomologist" Mr. E. A. Fitch gives some notes on the prospects of 1879, and he reports from Essex a considerable amount of present and prospective damage owing to the abundance of certain insect pests. Besides the too well known aphides and sitones he finds the common woodlouse (Oniscus asellus) very assiduous and abundant, having persevered in its attacks since the early spring. A less commonly observed enemy of the Pea is a small myriapod (Polydesmus complanatus), which Mr. Fitch found in swarms in some patches; these are white in colour, slender, and each deeply cut segment of the body bears two legs. North Kent does not appear to have suffered as much, at least in the fields, and though some species of those insects which the gardener dreads have shown a tendency to be very numerous this season some have undoubtedly been thinned down by the rains and winds, hence we perceive gardeners are not agreed whether 1879 will stand out as a black year because of its insect plagues.

THE REIGATE ROSE SHOW .- I have to thank my friend Mr. Payne (see page 72) for correcting me; but it was not ignorance. I wrote the names as he has corrected them, but my writing is not always like copperplate, and the printer (small blame to him) made the nearest hit he could to the mark.—D., Deal.

WORK FOR THE WEEK.

Sow Cabbage seed for the main crop. Heartwell Early Marrow, Hill's Dwarf Incomparable, Nonparell Improved, Wheeler's Imperial, Cattell's Reliance, Enfield Market, and Battersea are all excellent; the two latter are of large growth. Red Dutch is the best for pickling. The earliest plants must be pricked out as soon as they are ready, so as to secure sturdy plants. The advantage resulting from this mode of treatment more than compensates

for the time occupied in its performance. The sowing of Tripoli Onions should be completed with as little delay as possible, also Onions should be completed with as little delay as possible, also of winter or Prickly Spinach. Another good sowing of Turnips should be made for winter use. The Red American Stone Strapleaf, White Stone Golden Ball, and Chirk Castle Black Stone are admirable varieties. Carrots for spring and early summer use may now be sown, selecting the Horn or intermediate varieties, sowing them in drills about 9 inches apart in a sheltered place, the soil being of a friable nature and free if possible from wireworm. Broccoli and winter greens may still be planted as ground becomes vacant. The planting of Cauliflowers and Broccoli for autumn and early winter use should be completed as soon as possible. Where Endive is in request a good breadth should be planted with the early plants. Take advantage of suitable weather for earthing early-planted Celery, supplying later crops with water or liquid manure liberally, completing as soon as practicable the planting-out of the latest plants. To ensure a supply of Lettuce for early salads in spring the seed should be sown on a sheltered border, where the plants can be covered with frames in winter. We employ plant protectors and ordinary lean-to frames of about We employ plant protectors and ordinary lean-to frames of about 4 feet width, sowing the seed in rows about 8 inches apart. There will be a large amount of refuse now accumulating at the rubbish heap, which should have attention when other operations are impeded by unfavourable weather.

HARDY FRUIT GARDEN.

The recent genial weather has assisted the ripening of soft fruits. The Strawberry crop is much damaged by wet in some localities. After the crop of Strawberries is gathered the runners should be cut off close to the stools all around and the plants thoroughly cleaned of weeds, it being important that the crowns have full exposure so as to admit of their becoming well developed. have full exposure so as to admit of their decoming well developed. Except in soils where the plants do not make much leaf-growth it is not desirable to keep the plants beyond the third year, so that it is necessary to plant a third portion of the quantity required each season. In light soils the Strawberry is best treated as an annual, or at most as a biennial. In making new plantations no time should be lost, the ground being first trenched and well required. Select the strangest runners and preferably these ions no time should be lost, the ground being first trenched and well manured. Select the strongest runners, and preferably those that have been layered in pots and are well rooted, planting them 2 feet apart every way, which will be sufficient for the plants as annuals or biennials; but for remaining two or three years the distance for such free growers as Sir Joseph Paxton, President, &c., should be fully 6 inches more. The soil will require to be rendered firm about the plants. The three best Strawberries for general purposes are Vicomtesse Hencart de Thury, Sir Joseph Paxton, and President. The foliage of many fruit trees, particularly the more tender varieties of Apples and Pears, have a spotted blistered appearance, and the fruit is also spotted and disfigured. This is to some extent due to the hail that fell during the early part of the season when the leaves were tender. These trees as compared with others are making only a small amount of wood, and should have a few waterings with weak liquid manure. Vigorous trees, on the other hand, should be well attended to in pruning to let in light and air, as this season the spurs will need all the aid that can be afforded to induce them to form perfect fruit buds. Apricots have lost many branches; encourage fresh all the aid that can be aborded to induce them to form perfect fruit buds. Apricots have lost many branches; encourage fresh growth in their places. If the trees are carrying a heavy crop and are not very vigorous an occasional watering with liquid manure would help the fruit in swelling. Peaches and Nectarines are at last making headway—indeed, some have an extra quantity of gross shoots that require to be removed at once. Lay the wood in thinly, and any trees that are growing too luxuriantly mark for lifting in autumn as soon as the leaves begin to fall. This is the best way to keen Peach and Nectarine trees in a healthy finitfall best way to keep Peach and Nectarine trees in a healthy fruitful state. Although the crop of some varieties of Pears, Plums, and Apples is nil, of others but scant, the crop on some trees and kinds is greater than they will be able to mature. These should be freely thinned without further delay. Continue to keep the leading shoots of wall-trained trees of all kinds closely nailed or tied in, removing or stopping superfinous or foreright shoots in order that the young wood retained may have a chance of ripen-ing. Morello Cherries in cold localities will not ripen for some ing. Morello Cherries in cold localities will not ripen for some time yet, but when they show indications of ripening they must be efficiently protected from birds, and after hanging some time this fruit is by some esteemed for dessert. A few bushes of Red Warrington or other late Gooseberry, together with Red and White Currants, should be well protected with nets of small mesh to preserve the fruit until a late period.

FRUIT ROUSES.

Figs.—The second crop on early forced trees will now be ripen-ing fast, and watering at the roots must be diminished and syringing discontinued. As soon as the fruit is all gathered the trees may have a good washing with the syringe or garden engine to free the foliage from red spider, otherwise a free circulation of dry warm air should be maintained in the house until the foliage begins to fall off naturally. The earliest forced trees in pots should be placed out of doors in a sunny position, not allowing them to enter the content of the trees have them to suffer by want of water; the exposure to the atmosphere will harden the wood, which is of great importance, especially to the soft spongy wood of Figs. Young trees in pots from cuttings in the spring, and which are intended for fruiting in the second or third year of their growth, must still be attended to in pinching off the tops of all the strong shoots to form the foundation of a

symmetrical head in their first year's training.

Pines.—To retain a Pine sucker on the parent plant after it has Pines.—To retain a Pine sucker on the parent plant after it has attained a proper ripeness is more detrimental than otherwise; the sooner, therefore, it is removed the better. The suckers produced by the early summer fruiting plants should now be started. The treatment most suited to such plants as indicated in our last calendar should be continued until a growth in the plants is perceptible, when shading should be gradually discontinued. See that the heat of beds which have been reversed or upset by the removal and replacing of plants does not exceed 95° without immediately raising the nots, inattention to which will be most dismediately raising the pots, inattention to which will be most disastrons, especially in the case of plants bearing fruit. Shading for an hour or two at midday in bright weather during May, June, and July is highly beneficial where the plants are grown near the glass and the panes of glass are large; but there has been little need of it this season, and it is now unnecessary, as the plants need every ray of light and sunshine with a liberal supply of air when the temperature in the house stands from 85° to 95°; the night temperature for fruiting plants being kept at 70° to 75°, and for succession plants at 65° to 70°.

Melons.—Encourage the plants just planted out to make a strong and quick growth. A minimum temperature of 70° should be maintained, and a maximum of 90° to 95°, keeping the atmosphere moist. Train with one stem only, and allow it to advance between the bed and trellis as they appear, being careful to retain no more wood than will have thorough exposure to light and air. Afford support to heavy fruit hanging beneath trellises by means of tables or nets, applying water sparingly when the fruit is ripening, but do not, however, allow the foliage to flag. Earthup plants that have just set the fruit, placing a little quicklime round the collars as a check to canker, which is unusually prevalent this season, and when it appears must be promptly rubbed out with quicklime. Late crops in pits and frames should have a

steady bottom heat

Strawberries in Pots.-Runners intended for forcing should be transferred without delay into the fruiting pots. The plants for early forcing succeed in 5 or 6-inch pots. Turfy loam with an early forcing succeed in 5 or 6-inch pots. Turfy loam with an admixture of about a fifteenth of bone dust is a suitable compost, giving preference to a loam of a rather strong but friable texture. Pot firmly, keeping the crown of the plants rather high, and allow a depth of half an inch from the rim for watering. Stand the pots on a hard bottom in a situation where the plants will the pots on a hard bottom in a situation where the plants will have every advantage of light and air, and with due attention to watering and the removal of runners the plants will grow vigorously and mature the crowns early. Plants of the stronggrowing varieties intended for late forcing may have 7-inch pots. Plants that were layered into the fruiting pots will need to be well supplied with water, and must have the runners removed.

PLANT HOUSES. Store.-Allamandas that have been for some time flowering Store.—Allamandas that have been for some time flowering must be regularly supplied with liquid manure; those with confined root space, as those in pots, will require it more frequently. The earhest-flowered Gloxinias should be gradually dried off, and not, as is sometimes done, by withholding water altogether. Plants for late flowering should be kept near to the glass and be well supplied with water alternated with weak liquid manure. Gesnera zebrina, G. splendens, and G. exoniensis must not be placed under the shade of other plants or be kept at a great distance from the glass. Stout short growth is essential to ensure the production of strong flowering shoots and handsome leaves. Machymathuses are fine for heakets in late summer and autumn. Æschynanthuses are fine for baskets in late summer and autumn. If allowed insufficient water they will cast the flowers, and too much water will have a similar effect. Considering that these plants strange they are not more grown. Tillandsia Lindenii as a small decorative plant is beautiful, its intense blue flowers being very effective. Sandy peat well drained suits it well. Gardenias raised from cuttings in spring must not be allowed to become root-bound, but should be shifted into pots 8 inches in diameter. Toxicophises Thunbergi is a very distinct plant of good compact habit, not unlike a Gardenia; the flowers white, produced freely in corymbs like a small Ixora alike from the points of the shoots or axils of the leaves, and are sweetly scented. I. spectabilis is similar in habit and very desirable. They thrive best in sandy peat, not requiring a large extent of pot room, they flowering freely in a small state. Roof climbers should be looked over frequently, keeping the growths within reasonable bounds, and to admit light to the plants beneath. Fumigation will be necessary to keep thrips in check, frequently examining plants subject to to keep thrips in cheek, frequently examining plants subject to scale and mealy bug. Fire heat has been a necessity until now, and cannot be yet dispensed with. The night temperature must be kept at 70° and 75° by day, advancing to 85° or 90°. Syringe lightly moraing and afternoons, taking care to have the foliage dry before nightfall. If red spider obtain a hold, as it generally does, on the under sides of the leaves of Dracesnas, sponge with soapy water, and afterwards with clear rain water. Indeed plants

grown for the beauty of their leaves and not hairy can only be kept in good condition by an occasional sponging.

TRADE CATALOGUE RECEIVED.

E. H. Krelage & Son, Haarlem.—Catalogue of Bulbous Plants.

TO CORRESPONDENTS.

*, * All correspondence should be directed either to "The Editors" on to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

ADDRESS (A. F.).—Write to Mr. Cannell, The Nurseries, Swanley, Kent, who supplied last year what you require, and may possibly do so now.

A TWN ROSE (J. A. W.).—When Roses are growing vigorously, as yours appear to be, they occasionally produce flowers like the example you have sent. The "freak" is not peculiar to the variety Bessie Johnson.

SEEDLING PELAEGONIUMS (F. Thomas).—The flowers you cent were not remarkable or distinct in any way from varieties already in commerce, although the trusses were good and the colours bright.

LARGE PRARS (Sidmouth).—The large Pears you refer to are Catillac and Uvedale's St. Germain. You ought to be able to procure them at any good

PLANTS FROM CAIRO (E. L. Lister).—All the plants you mention will do with ordinary greenhouse treatment. There is nothing special about any of them that requires anything particular in its management, and in general terms if you treat them as if they were Fuchsias they will do very well.

STRAWBERRY (F. V. B., Down).—The Strawberry you sent is neither Sir Harry nor Sir Joseph Paxton, but a worthless variety of which we do not know the name, if it ever had one. You had better throw it away.

know the name, if it ever had one. You had better throw it away.

Plants for Shady Rockwork (J. C. W).—We presume the rockwork is not densely shaded by decidinous or other trees, in which case few things would succeed except Ferns, but if not so situated the following may answer:—Arabis albida, Ajuga orientalis, Anemone apennine, A. nemoresa, Aubrietia deltoides and var. grandifora, Callizene polyphylla, Cyclamen coum vernum, C. hederæfolium, C. neapolitanum, Dianthus floribundus, D. glacialis, Epigæa repens, Hypericum calycinum, H. numuularium, Lamium longifiorum, Meconopsis cambrica, Myosotis sylvatica, Omphalodes verns, Papaver nudicaule, Hamondis pyrensica, Rhododendron hirsutum, Vinca acutiloba, V. minor, V. major, and V. elegantissima.

SOWING ANNUALS (E. H. E.).—Limnanthes Douglasii, Candytuft, Eschscholtzia, Saponaria, *Clarkia elegans and *C. integripetala, *Catananche cerulea, *Convolvulus minor, *Limnu grandiflorum, Nemophila insignis, Pyrethrum sureum, *Mignonette, and Silene pendula compacta should be sown early in April and where they are to flower, we presuming that you intend to substitute them for Geraniums; but if intended for spring flowaring they should be sown the arly part of September, except those marked with a star, which should be sown in spring; and the sooner the Silene, presuming it be wanted for spring flowering, is sown the better. Seed of Antirrhinums, Canterbury Bells, and Indian Pinks ought to be sown at once, and would have been better sown six weeks earlied.—There are uncommon, but

TUBERS ON POTATO STEMS (Your Subscriber).—They are uncommon, but we have seen other instances

we have seen other instances.

MELONS NOT THRIVING (A Lady).—Possibly the soil you have employed is unsuitable, being too light and fine; but we suspect the chief cause of the fruit not setting and swelling freely and the foliage decaying prematurely is the result of a too cold and moist atmosphere. Melons cannot be successfully grown in dung frames during a season like the present without fresh linings of fermenting materials are periodically applied, so as to provide a temperature of from 60° to 66° at night, with the lights raised about half an inch at the back of the frame. You cannot renovate the plants this year, but with the experience you have gained you will probably succeed in preducing satisfactory crops next year if the season is more favourable, as we hope it will be, than the present ungenial summer. If you can increase the emperature of the frame do so, and ventilate freely, never having the lights closed entirely however dull the weather may be.

STRIKURG ALLANKING (T. G.)—Select continues two propositions of the continue of the frame of the frame to the continue of the continue of the frame of the frame to so, and ventilate freely, never having the lights

STRIKING ALLAMANDAS (T. G.).—Select cuttings from short-jointed growths and insert them in sandy soil, placing the pots in heat, shading and keeping the foliage fresh as long as possible, and most of the cuttings will emit roots readily. See notes by Mr. Bardney in another column.

DIGGING RARLY POTATORS (Amaleur, Kingston).—The prolonged growth is wholly the result of the continuous rains. If the tubers have attained to a fair size and you want them for seed take up the crop at once, spreading the tubers thinly in a cool shaded place, such as a shed, and they will ripes better than if left in the ground during a season like the present.

GRAPES SCALDED (J. J. B., Notte, and Gardener.).—The prolonged dull weather followed by sudden outbursts of sun, especially early in the morning, has caused many Grapes to be injured in the same manner as yours are. The remedies are careful ventilation, leaving a little air on at the top of the house all night and admitting more before the temperature rises materially, in the morning—not after it has risen. If this fails, then it may be necessary to sprinkle a little limewash on the glass over the Vines that are the most affected. Do not prune the laterals too closely, but allow as much foliage to form as you can without overcrowding.

DESTROYING DANDELIONS (A. M.).—Sulphuric acid can be purchased cheaply from any chemist and druggist. It is not necessary to cut off the tops of the weeds before the acid is applied, as if a little of it (a drop or two) is dropped quite into the hearts of the plants the leaves will speedily wither and the roots die. When properly applied we have never known it fail in destroying Dandeltons and Plantains on lawns and walks. It should not be entrusted to beys or women, as it burns everything it touches.

WORKING HOURS IN GARDEN (Old Subscriber).—The custom varies somewhat in various districts. In such a case as yours it appears desirable that special arrangements be made. As you do not wish to be "too exacting" you will have no difficulty in obtaining men who will conform to reasonable terms.

SHREWSBURY ROSE SHOW (A Lover of Horticulture),-We shall be glad

SHREWSBURY ROSE SHOW (A Lover of Horticulture).—We shall be glad to receive your name and address.

DOUBLE TURK'S CAP LILY (Res. F. T.).—It is a scarce variety, but is in commerce. The flower sent is very elegant.

RESIDET TURK'S CAP LILY (Res. F. T.).—It is a scarce variety, but is in commerce. The flower sent is very elegant.

RESIDET SHOWS THE SOCIETY SCARCE, Chiswick, London, who will supply you with the information you require.

LISECTS INVESTING ONIONS AND MANURE (Tyro).—These are not true insects but Myrispods, and though occasionally injurious they are predatory in halfs, devouring mites, &c. The box sent contained specimens of but one species a small plus, or Millipede, in various stages. The other you describe we take to be the Electric Centipede (Arthronomalus longicornis), which is fond of wall fruit. Is it possible that the Onions have been attacked by the grub of the Onion fly (Anthomyia ceparum), which has escaped natio though it has done the damage? We scarcely think what you describe can be attributed to the Julus. These and similar species may, however, be destroyed by the application to the soil of diluted ammoniacal solution, about one pint of the liquor obtainable from gasworks to six gallons of water; or a free surface sprinkling of soot suits some cases.

NAMES OF FRIUTS (G. H. B.).—Many Strawbarries are so like each other its difficult to name them by the fruit alone. That which you sent is probably Keens' Seedling.

NAMES OF FRIUTS (G. H. B.).—It analysis of Parlaments of Princy levels.

probably Keens' Seedling.

If is difficult to name them by the fruit alone. That which you sent is probably keems' Seedling.

NAMES OF PLANTS (Jas. Shearer).—1, Anthyllis Vulneraria; 2, Pinguicula valgaris; 3, Narthecium ossifragum; 4, Lycopodium alphuum; 5, Euphrasia officiasiis; 6, Sedum villosum. (Judy).—Specimens all very withered. 3i a Sphraa; 4, a Verbascum; 5, Thalictrum flavum. The others we could not neogains. (J. D.).—Potentilla formosa and Tradescantia virginica. (A. Ma).—It is impossible for anyone to name such imperfect specimens. (F. G.).—3, Sedum oppositifolium; 4, Campanula pulla; 5, C. pumila alba. The other specimens were insufficient. (Inquirer).—The specimen was too shrivelled to be recognisable. (A. C.).—1, Spiresa japonica; 2, Phytolacca decandra; 3, Lysimachia vulgaris; 4, Deutsia crenata florepleno. The other specimens were too withered to be identified. (G. O. S.).—Campanula Trachelium, Lathyrus latifolius variety. (W.).—Populus alba. (E. D. B., Cofford.).—We cannot name plants without flowers. You do not even state the colour of the flowers. (F. H.).—Deutzia crenata flore-pleno. (L. M. A.).—Staphylea pinnata. (Willesden).—We cannot recognize the spay in its shrivelled state. If you can send us a flowering specimens well endeavour to name it for you. (O. P., Hanty).—Good flowering specimens should be sent to our office, the numbers being attached so that they can be seen without untying the ligatures. The specimens should arrive in a fresh state, not more than six being sent at a time. (J. Henshaw).—It is the York and Lancaster.

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

THE ROT, COATHE, OR BANE IN SHEEP. (Continued from page 97.)

In a wet season—when it has been likely to produce coathe in the sheep, and when they have been feeding upon gross and anhealthy herbage in the autumn months—we adopted for several years upon a farm under our agency, situated near the sea coast in a southern county, the plan of several changes of pasturage and food for our breeding flock of ewes during the twenty-four hours. The first thing in the morning the ewes were driven to a salt marsh—that is, pasture land reclaimed from the sea; about ten o'clock they were removed to pastures containing coarse herbage on wet and flat-lying land. In the afternoon they were removed to the arable land, and fed upon green fodder, such as trifolium or vetches, clover, mustard, &c., and allowed to remain there for the night, and again fed on the salt marshes in the morning. In this way we kept our flock healthy and sound, and we can recommend this practice to the home farmer under any circumstances; for the points to be observed are, that when feeding on doubtful and unsound meadow land they should not be allowed to remain there night and day, although there may be an abundance of grass, but they should have a change of food once a day (the produce of the arable land), and lie thereon at night. This treatment naturally raises a question where no salt marshes are available as to the best method of proceeding, and even then the answer must be a qualified one, seeing that a breeding flock must of necessity be managed differently in various respects as compared with a flock that is kept fatting for the purpose of producing mutton.

In maintaining a breeding flock in full health the pastures will have to be considered, and it often happens that some portions require to be drained, and this on the home farm can generally be done by consent of the owner when the necessity is explained. In the case of tenants, however, it becomes a different matter, for if the landlord will not drain the land the tenant must incur the expense or leave it undrained, and this is just the position of large tracts of pasture land in almost every district in the kingdom. If a breeding flock is kept under such circumstances

it should be quite understood as being done in such seasons as last year and at present by running a great risk of coathing the stock. Where no salt marsh pastures are at hand the question of distributing salt water where it can be obtained, or water with salt in solution, applied by a common water cart with spreading sait in solution, applied by a common water cart with spreading trough, will arise, and this is often done with effect on pasture land lying high and dry. If salt cannot be conveniently applied with water it may be sown over the land by hand in its natural state. Upon the worst and undrained land or parts of pasture with inferior herbage growing, and a moderate dressing of 3 or 4 cwts. per acre, and the like quantity of superphosphate, it will not only improve the herbage but tend to make it more sound and healthy feeding for sheep and cattle, and destroy or render inocuous any fluke entozoa which may be present.

After alluding to the livers of sheep being affected and the fluke found in them, it by no means follows that we cannot have sheep suffering from rot without flukes being present, because the liver is often subject to disease. No doubt the fluke in embryo will only live and breed in the animal under the natural conditions of their existence—a diseased liver or organism, and that as we have shown in our own practice sheep being fed upon unsound meadows may yet not suffer from the fluke parasite by reason of the changes of their daily food being of a healthy nature. It seems to be one of the most natural questions to ask how the fluke entozoa comes upon the pasture land, and particularly when it is found only upon soils where the water lies stagnant. This is well explained by various veterinary professors and physiologists, but we cannot give it in extenso, because our object is to give in a practical form sufficient to guide the home farmer in his daily management of the flock. All the authors who have written upon the subject during several centuries have had very different opinions upon certain parts of the subject; they, however, agree in a remarkable manner as to the feeding in water meadows being unsafe for sheep except after the month of May and down to the month of October, the spring growth of grass being quite safe food. There is, however, strong evidence in favour of not feeding sheep on any grass in the autumn too closely, it being related that a whole flock of sheep feeding in some meadows in Devonshire were coathed except four animals, and these were found to have the malformation of the jaw called pig mouth, and from the under jaw being much shorter than the upper they were not able to bite so near the ground. Now this fact may well teach us a lesson not to allow the sneep to eat the grass too short, in a wet season at any rate, and also that if convenient it would be better for bullocks to be fed off it, as they are known not to feed so closely as the sheep. In this way it is not at all more reasonable to suppose they are able to feed on certain pastures without injury when unsafe for sheep.

Various theories have been started as to the production of rot, but all agree as to the agency of moisture in producing the disease. Some consider that it is produced by marsh missma—by emanations proceeding from decaying grass and the soil, and entering the system by means of the lungs. There is also the opinion that the disease is to be attributed to the taking into the system of a superabundance of watery food, thus surcharging the body with aqueous matters and diluting the blood. The last two causes may well be the means of producing a diseased liver, but in accounting for the flukes found in it we must also refer to another theory—viz., that the eggs of the fluke being deposited with the dung from sheep affected with the fluke, and preserved from destruction by warmth and moisture, and are swallowed by other sheep feeding on the grass. It is, however, of but little importance to the practical farmer how they originate, and so long as he knows where the fluke entozoa are to be found, and under w conditions of soil and climate they exist, it is enough for him. He is then sufficiently armed to know how to defend his flock against the enemy if he will carry out practically the means of escaping them. This has been our endeavour throughout our treatment of the subject to show how the disease may be avoided,

seeing that it cannot be cured.

It is, however, of the utmost importance that the home farmer should be acquainted with the symptoms attending this disease, which at first are by no means strongly marked. There is no loss of condition, but rather the contrary apparently; indeed, sheep intended for the butcher have been purposely coathed or rotted in order to increase their fattening properties for a few weeks. This practice was adopted by Bakewell, the celebrated breeder of Leicester sheep, who made enormous prices of his sheep for the purpose of breeding. It was done to prevent sheep sold to the butcher being held over for breeding, and thus compete with his own stock. The usual symptoms of coathed sheep are a pale and dejected countenance, and upon parting the fleece the skin is found to have changed its vermilion tint for a pale red, and the wool being easily separated from the pelt. As the disorder advances the inside of the cyclids becomes almost white, and afterwards yellow; symptoms of dropsy often extend over the body, and in the latest stage of the disease a large swelling under the jaws filled with water often occurs. Large numbers of sheep in an unsound state were sold last year, and are likely to be so this year; we therefore advise that extreme caution should be used in

-

buying sheep. Many sheep are in low condition this year through scarcity of food in the spring, and the circumstance should always raise a doubt in the mind of the buyers, as unsound animals may be passed off as having been badly kept and managed. In order to secure the purchaser he should know the district from whence the cheep was the state of the state of the cheep was the cheep was the state of the cheep was the the sheep were brought if possible, and as a further security the seller should be asked for a written warranty of their being sound.

seller should be asked for a written warranty of their being sound. This has been our practice for many years, and on our drawing a cheque in payment we have added the words, "for sheep of a certain breed warranted sound," and made payable to order.

Having now taken up nearly all the practical points in favour of the home farmer we can only refer him for further information if required to an exhaustive article by Professor Simonds in vol. xxiii. of the "Journal of the Royal Agricultural Society of England;" and also to a work by W. C. Spooner, M.R.V.C., on the structure, economy, and diseases of the sheep.

WORK ON THE HOME FARM.

Horse Labour .- This has proceeded with more effect since the favourable change in the weather which occurred about the 28rd favourable change in the weather which occurred about the 28rd of July, and at those times when the horses were not employed at hay carting they have been drilling some Scotch yellow hybrid turnips in consequence of being unable to get the horses upon the land during the best season for drilling Swede seed—namely, from the 7th of June to the 1st of July. The hybrid turnips partake of the nature of Swedes to a certain extent, and although take of the nature of Swedes to a certain extent, and although they grow much faster than Swedes yet they stand the winter well, and often prove the only substitute for them. This variety of turnip is better for feeding in the spring than in the autumn, for unless they are thoroughly ripe and full grown they have an acid taste, and it is some time before the sheep or cattle take to them if fed early unless they are previously pulled and allowed to lie on the land for a time or stacked in heaps. Up to the 24th of July no work could be done with advantage upon the mixed soils in fallowing or preparing for turnips. The land had been so thoroughly scaked and the rains so continuous that the horses. fallowing or preparing for turnips. The land had been so thoroughly soaked and the rains so continuous that the horses during a long interval could only be employed in odd work, such during a long interval could only be employed in odd work, such as carting earth to heaps and carting dung to the fields, where it will be required for laying out for wheat. As a rule, however, we do not recommend the home farmer to make up heaps of manure a long time before it is required for laying out, spreading, and ploughing into the land. We therefore advocate the laying-out of manure on to clover seeds in the winter months, as the manure goes so much farther if laid out fresh from the farmyard or cattle and pig pens. Although it proves a long time before the wheat land is ploughed for sowing, yet it has improved the clover crop, and thereby improved the land for wheat; because it is a wellascertained fact that the increase of the roots of clover is a clear gain as manure for the wheat crop. After the land has been ploughed and pressed the gradual decay of the clover roots yields a valuable assistance to the wheat from seed time until harvest, or in case the land is sown with oats it has the same effect upon the yield of grain. The odd horse has in most soils been unable to effect the interculture of root crops by horse-hoeing. In most cases the fields sown with root crops are in a very foul condition, and a considerable extent will be lost entirely by being ploughed up or remain to produce less than half a crop. In a season such as we have passed through turnip sowing has been so much delayed that it becomes a very important question how late turnips can be sown with a prospect of a fair crop. To some extent this is a question of soil, of climate, and the manure applied. It is likewise important to sow the variety of turnip hest adapted for late drilling. There are several varieties recommended by the seedsmen, but it is the province of the home farmer to consider the matter, and select not only the quickest-growing variety but also that which will maintain itself during winterly weather. The also that which will maintain itself during winterly weather. The six weeks small white turnips are often sown very late, and they will often yield a good deal of food without hoeing, because they will grow very close together, and although the bulbs may be small in size yet numbers tell the same as in garden culture. This variety may be sown after the middle of August; but before that time the best we can recommend is the Grey Stone. These will not only grow very quickly but they are very good for stock, and will maintain their feeding value without rotting during the winter months. winter months.

Hand Labour.—Both men and women will still be employed in connection with haymaking, because in all the late districts of the kingdom the pasture grass will be now being cut for hay, and upon the arable land the second cutting of clovers and Italian rye grass upon the early and warmest soils will be ready for the mowing machine in a few days. There will be, however, seconding to present appearance plant of the for completing the mowing machine in a few days. There will be, however, according to present appearances, plenty of time for completing the hay harvest before corn harvest commences. We must again, as we have often done before, call attention to the saving of labour during harvest by getting all the straw ready drawn for thatching the corn ricks. Especially will it be necessary this year, the harvest being so late, that every day's labour which can be saved during the harvest will prove of more than usual consequence. The flocks of down ewes lately purchased for the purpose of breeding lambs to be fattened off early must have

the rams turned in with them. The Cotswold ram is often used for the purpose, for they not only afford more lambs in number but they come early to maturity. These are two very important points to be considered by the home farmer. If it is desired that the ewe should offer to the ram as early as possible they must be kept upon a generous diet, and at least two changes of food per day are quite necessary, from grass to green fodder crops or from pasture to saintfoin, or to early-sown tail rape, which is one of the best kinds of food. If any other food is required besides grass or vegetables cracked beans are best, as they not only keep the ewes healthy but induce them to offer early to the ram. The the ewes healthy but induce them to oner early one that ran-summer-grazed cattle, whether heifers or steers or whether barren cows or oxen, if well fed on good grass will now be nearly ready for the butcher, especially if they have had cake or cracked beans, either of which will have answered a good purpose during the late rainy season.

KERRY CATTLE.

When the many points of excellence of the Kerry cattle come to be more generally understood there can be little doubt they will become general favourites, not merely as fancy stock but as really valuable animals both for the dairy and butcher. For really valuable animals both for the dairy and butcher. For cattle to be really profitable in these days of close competition with the markets of the whole world they must fatten quickly as well as give milk abundantly which will yield cream and butter at least up to the Alderney standard in quantity and quality. I have seen enough of the Kerrys to enable me to say they do all this and more for these are could approach to other breads in this and more for they are equally superior to other breeds in hardiness and in the consumption of coarse rough herbage usually left untouched.

I have only what may be termed the nucleus of a herd-a bull I have only what may be termed the nucleus of a herd—a bull and three cows—under constant observation, but these answer so well that I hope gradually to get enough of them to be able to dispense with a herd of mixed breeds—Shorthorn, Alderney, and Sussex. These three cows were out in all the rough cold weather of last winter, and like a Shetland pony, apparently prefer an open pasture to a snug shed. I happened lately to go past the cows during a heavy shower and was amused to find the Kerrys quietly grazing in the open, while the other cows were all haddled cows during a neavy shower and was amused to find the kerrys quietly grazing in the open, while the other cows were all huddled together for shelter under some trees. This hardiness, together with the lesser quantity of food required by such small cows, enables one to maintain from a third to one-half as many more of them in excellent condition upon a given area of land than one could of the larger breeds. This holds good especially upon light thin soils where heavy goog of grain mosts or green earnest he had without the larger breeds. This holds good especially upon light thin soils where heavy crops of grain, roots, or grass cannot be had without a preparatory equivalent in the form of heavy dressings of manure. rendering the maintenance of a herd of Shorthorns an expensive and exceedingly doubtless business. Notwithstanding this indisputable fact young Shorthorn stock generally commands a ready sale at high prices in the very midst of "the poor farms of Sussex," yearlings in some instances last autumn actually selling at from £17 to £19 per head at auction sales at which I was present. If the buyers had secured a couple of Kerrys at the price given for one of the larger animals, and been equally orudent in other one of the larger animals, and been equally prudent in other matters, one might not subsequently have heard quite so much about "hard times."

about "hard times."

Breeders of Kerry cattle will do well to remember how much depends upon careful selection now. We have already an abundant yield of rich milk, a sleek and lusty condition without high feeding, a robust and hardy constitution, and I believe I may add beef of such excellence as to be specially sought after by connoisseurs. If to this we can add that boast of the Shorthorn breeder, rispances for the butcher at the age of two years than indeed may ripeness for the butcher at the age of two years, then, indeed, may we claim to have taken a step in the right direction in the cultivation and improvement of a neglected breed of cattle about which it was written full thirty years ago:—"The cow of Kerry is truly a poor man's cow, living everywhere hardy; yielding for her size abundance of milk of a good quality, and fattening rapidly when required."—EDWARD LUCKHURST.

POULTRY SHOW SCHEDULES.

WE have a number of schedules before us of late summer and early autumn poultry and Pigeon shows, most of them in connection with agricultural or horticultural exhibitions.

The Staffordshire Society this year holds its Show at Wolverhampton on September 18th and 19th.

The old-established Halifax and Calder Vale Association holds it has the second of t

The old-established Halifax and Calder Vale Association noise its one-day Show on August 80th in the grounds of Craven Lodge, Halifax. The prizes for poultry and Pigeons are not large, but there are many cups to be awarded. The classification is good and the entry fee extremely moderate—viz., 8s. per pen. The classes for poultry which must all have been bred in 1879 are thirty, of which no less than eight are for Game and five for Game Rantams. Pigeons to be shown singly have thirty-four classes. thirty, of which no less than eight are for Game and nive for Game Bantams. Pigeons to be shown singly have thirty-four classes. We are glad to observe that the Society has a class with good prizes for mules and donkeys. Entries close on August 16th.

The Cheshire Agricultural Society publishes a good schedule for its Exhibition of poultry to be held at Cheshire on August

39th and 30th. There are twenty-three classes with good prizes. A dog show will be held in conjunction with it.

The Bicester Agricultural and Horticultural Society offers sixthen classes for poultry and five for Pigeons at its Show to be held at Bicester on September 3rd.

The Guildford Agricultural Society will this year hold a Show

of cattle and homes at Guildford on September 9th. This Show has hitherto been combined with that for fat stock at Christmas.

The Surrey Columbarian Society has in consequence of the very late and uniavourable season for rearing Pigeons decided to post-pone its August Show of young birds till the winter. Its last most for Homing birds of the year will be from Beading on the

BIRDS IN THE LONDON PARKS.

BIRDS IN THE LONDON PARKS.

THE extraordinary season seems to have influenced the habits and migrations of birds. It has been generally observed that the London parks and squares have through the season been strangely devoid of their usual feathered tenants, especially the Hirundines. So striking has their absence been that a leading article of the Standard was lately devoted to the subject, in which we read, "The London parks in summer are a favourite haunt of the British Hirundinacese. The water—always more or less stagmant—attracts swarms of guats and other such insects, and the gnats attract the Swallows. Bound the Serpentine, indeed, and over the ornamental water in the Regent's Park. ed, and over the ornamental water in the Regent's Park, Swallows are usually as numerous and almost as tame as Pigeous in Westminster Palaos Yard, and there is hardly a Londouer so unobservant that he cannot foretall the weather for the next few unobservant that he exampt foretall the weather for the next few hours by the Swallow's flight. This year, however, the prottiest of our summer visitors is beyond all question exceptionally late." There follows an interesting comparison of the dates assigned by various great naturalists for the probable arrival of the Swallow in England. Yarrell gives the 10th of April for the mean period of its arrival; Mr. Davy, a great professional London bird-catcher and fancier, "the middle of April." Our observation certainly leads us to agree rather with Davy than Yarrell. We have been surprised to observe that in central Italy the Swallow does not arrive more than a week before it reaches our shores.—C

VARIETIES.

HAVING recently travelled through several counties where the storm of Saturday night was the most severe we can testify to the desolation that has been wrought by its dread intensity. We the desolation that has been wrought by its dread intensity. We have seen villages submerged, roads converted into rivers, and fields into lakes; tons of hay floating and rotting, corn flattened never to rise again and yield of its increase, trees split, glass broken, and railways blocked by landslips. The loss must be great and to many almost unbearable. Agricultural prospects appear to become more gloomy as the season advances and harvest approaches, if indeed there is a harvest at all in some of the latest and wettest districts during this memorable season of 1879.

THE antiquity of the breeds of fancy Pigeons is an in-teresting subject. We have lately seen a Venetian mosaic, which can hardly be later than the fourteenth century, of a Pigeon feeding its young one. They are both unmistakeably Trumpeters of the nnimproved type.

THE serious outbreak of typhoid fever among swine in the south of England has extended to Cheahire. Mr. Joseph Furber, Ansterson Hall, near Nantwich, has lost seven out of his hard since Monday, and has six others which are not likely to recover. The dead pige have been buried in quicklime, and the others duly

— THE Toronto Telegram of July 12th mays—"The reports of the crops as they appear in the Globe are said to be far brighter than the facts warrant. We understand that in some quarters fall wheat will be but a half crop, and that in other grains the prospects are not nearly so good as the Globe has painted them. The present is the critical moment. If the wet weather continues it will do the crops great harm. The reports from the United States are the crops great harm. The reports from the United States are very favourable. The crops garnered have been unusually large, In England continuous rains have seriously interfered with the crops, and the prospect is said to be a very blue one if not actually ruinous. The ill wind there will blow good to the farmers here, and if the crops turn out well the farmers here will all make money, and times will begin to brighten again."

will be held on August 19th and 20th.

— Mr. J. P. Shrilden writes to the Timer.—The price of milk is a matter which is now receiving a good deal of attention in the Press of this country. Mr. Read was not overstating the case when he said farmers would be glad to receive 6d. in the sammer and 8d. in the winter per imperial gallon for their milk. They certainly would pay their way at these prices, providing

they made no bad debts and were not bound to supply a given quantity of milk in winter. But in order to sall his summer's milk he is bound to supply a given quantity in winter, when milk is scarce; and, as every dairy farmer knows, the production of milk in winter is a costly operation. At the present rate of rents, wages, &c., while 6d. a gallon in summer is barely a rent-paying prace for milk, 8d. in winter is wholly inadequate where the farmer has to supply a quantity corresponding to his summer production. At the same time there is not now and has not been any solid reason why the public should pay 5d. per quart—this is the prios a boy, whom I stopped the other day in one of the suburbs of the west of London, told me he sold his milk at. Fourpence a quart the year round would afford ample profit to the retailer, who now pays as follows for milk delivered at the London railway termini:—April, May, June, 1s. 4d.; July, August, September, 1s. 6d.; October, November, 1s. 8d.; December, January, February, 1s. 9d. per barn gallon of 17 pints. By charging exorbitant prices the retailers are hindering the development of a trade which would rapidly increase, benefiting alike the farmer, the dealer, and the consumer. quantity of milk in winter. But in order to sell his summer's milk

THE FERTILE WORKER BEE .- No. 5.

I STATED that the careful following-out of a series of experiments with a definite object would prove, even to those beyond the novitiate stage of bee-keeping, a capital plan to learn by expethe novitate stage of boe-keeping, a capital plan to learn by experience facts that otherwise might escape their notice; and they when least expected one of these facts noted during the experimental period would materially assist in the proper and rapid diagnosis of any event occurring in the apiary of a puzzling character.

I said that I had just met with a case in point. One of my stocks that had been very strong all through the winter I noticed in March had an excessive quantity of drone brood; again, April 14th, I noted the same; but in other respects the colony was in good order, had an abundance of brood in all

April 80th I proceeded to examine it, hoping to find it quite

ready to yield me an artificial swarm.

I have narrated how I found two drone larvæ in the royal cells constructed in the fertile worker hive. Now those two-drone royal cells were excessively elongated, so much so as to cause me some surprise. The first frame I lifted out of the above-mentioned hive had queen cells, but of such an inordinate length as at once to attract my attention. These royal cells resembled those in the fertile worker hive!

Something wrong here, I thought,
Proceeding further I found the population of drones excessively
great, and an enormous amount of drone brood. Ist once decided that the hive had either a drone-laying queen or a fertile worker. Seeing the quantity of hatching-out workers still left, I felt very soon convinced it was not a case of fertile worker but that of a drone-laying queen; but then the quantity of royal cells—such numbers! This raised the suspicion in my mind that the queen worn out had taken to laying drone eggs, and had then either died of old age or been killed.

Examining carefully I found my conclusion correct, for in a knot of bees on the floorboard I found the queen dead, showing all the signs of death by suffocation, one of the principal of which is that the colour changes to a gleasy black. Her wings also were completely bitten away; evidently she had been harried to death, the bees instinctively seeing the colony had no chance of existence if she were suffered to remain at its head.

Now, assuming I can at once proceed to save that colony, you will perceive how by the observation of the particular shape of those two-drone larva queen cells in the experimental fertile worker hive, I was led at once to thoroughly examine, and come to a conclusion as to the cause for these inordinately lengthy

royal cells.

I do not know if royal cells of such length are often met with, so I post five of those cells intact for them to measure, and repre-

sent by woodcut if they so desire or consider sufficiently interesting. I also send drones of the North African variety hatched out ing. I also send drones of the North African variety hatched out of the fertile workers' eggs, also Italian workers hatched in that fertile worker hive from the comb of broad given. The Editors will therefore be able to see and substantiate the vast contrast in will therefore be sole to see and substantiate the wast contrast in colour, and the great facility marked difference of variety gives for experimental purposes. I send also the queen of the hive from which those long royal cells come. They will note how polished her body is, the absence of wings, &c.—ARTHUR TODD, polisneu Blidah, Algeria.

[By the kind permission of the Editors I have examined these extremely interesting pseudo-queen cells with attention, and find that whereas the normal cell has an average of scarcely more than nine-tenths of an inch in internal length, that represented in fig. 15 similarly measured is an inch and one-fifth, and that in fig. 16 is similarly measured is an inch and one-fifth, and that in fig. 16 is hardly less than an inch and one-third. Such cells as these are very unusual; but similar, although I believe shorter ones, I had the opportunity of exhibiting at one of the British Bee-keepers' soirées. These also were abortive, and were in like manner the result of an attempt on the part of the bees to raise queens when their colony was being ruined by a fertile worker.

The dead queen referred to by Mr. Todd has lost nearly every hair from the abdominal rings and almost all from the thorax, while the wings are nibbled down to the roots. My experience leads me to more than doubt the theory of Huber and Dzierzon, that the fertile worker is raised in a cell adjoining the queen cell, receiving as part of her nourishment some of the royal pabulum.

receiving as part of her nourishment some of the royal pabulum, which thereby in some unknown manner partially metamorphoses her and gives her the power when born in a queenless hive of taking upon herself queenly functions. Twice I have had fertile workers appear immediately after removing a queen in hives which had never, so far as I had evidence or so far as the combs which had never, so rar as I had evidence or so far as the comos gave evidence, even attempted to commence queen cells. Mr. Todd gives my opinion exactly when he says, "The power to produce eggs was latent up to the time I made the colony queenless; then finding herself [the fertile worker] in a hive with no queen, the desire to be up and doing brought forth the latent power." In fact in other insects that occurs which enforces and illustrates this opinion. Thus the termites of Brazil produce winged males and females, which early in the warmer season fly abroad and mate with new blood, fulfilling the law which we see observed in the bee hive. If some of these fecundated females return to the nest (and any of these are welcomed whether strangers or not), all is well, but should none return and the continuance of the colony become thus endangered, imperfect females mate with males with undeveloped wings within the nest; the former lay and perpetuate the life of the colony, although the advantage of new blood is denied it. Here we have the counterpart of the fertile worker. The undeveloped female under a stimulus similar fertile worker. The undeveloped female under a stimulus similar to that supposed to exist in the queenless hive becomes a true but inferior mother. In the case of the fertile worker the drone performs no part, for a reason which I believe I have discovered, and so parthenogenetically the fertile worker gives males only. Amongst flowers even we see the same law in operation, some plants producing late in the year closed blooms which must be fertilized with their own pollen; so that seeds failing where alien pollen has been demanded others are certainly produced, although of inferior power, by self-fertilization. There is a oneness in all nature which constantly gives the answer to a difficulty in one nature which constantly gives the answer to a difficulty in one

nature which constantly gives the answer to a difficulty in one place by a fact in another.

Mr. Todd says, "Cells containing five, six, and even more eggs I have come to regard as an unmistakeable proof of the presence of a fertile worker." Mr. Todd would no doubt, keen observer that he is, allow that there is one exception which had better be pointed out for the benefit of the learner. A good queen, being taken from a strong stock and put with a nucleus where she has but a small number of cells in which to deposit her abundant eggs, will often deposit several in each cell, and a young queen raised in a nucleus will very generally do the same thing, these exceptions proving the rule.—F. Cheshire, Avenue House, Acton, W.]

REVIEW OF BOOK.

Manual of Bee-keeping. By JOHN HUNTER. Third Edition.
London: David Bogue.

The need for and acceptability of this manual has been attested by its passing into a third edition, which is brought up to date by considerable alterations and additions. Amongst these we have a chapter on comb foundations, in which this modern achievement, as important in its results as the extractor, is well treated and illustrated, while the author takes his readers into his confidence and becomes a revealer of secrets as to costs and value in a manner not likely to evoke the gratitude of the trader. Supers as we now have them in sections with separators receive due attention, while the chapter on artificial swarming is fuller by much than that previously given. The book is eminently readable, and may be accepted as a reliable guide in the varied operations of the modern

The increased attention given to bee-keeping during the last Herbs....... bunch 0 2 0 0 Turnips bunch 0 6

few years has, however, brought some books into the market which could well have been spared. Amongst these we think may be classed "A Manual of Rational Bee-keeping," by C. De Ribeaucourt, translated from the French by Arthur F. Leveson Ribeaucourt, translated from the French by Arthur F. Leveson Gower. Here, generally speaking, the methods advocated would in this country be regarded as obsolete, while the advice often shows but a very filmsy acquaintance with the matters treated. In these days, when the British Bee-keepers' Association's tents show the operation of driving in the presence of multitudes of would-be bee-keepers before whom never more than a few minutes are occupied in getting rid of the bees, a book which says that "after beating upon the side of the hive for an hour and a half if no effect is produced the process had better be repeated next day," is sure to be little read and less followed.

OUR LETTER BOX.

HEXAGONAL SHED (F. A. W. W.).—The cost of this will vary in different localities, as the materials vary in cost, &c., in different districts. An estimate from a local builder is the best way to ascertain cost, together with dimensions of timber, planking, roofing, &c. The brickwork at the bottom should be made about 1 foot above ground level, and 1½ foot below, in order to allow for excavating earth for the floor to be filled with ashes, &c.

30th.—Very fine hot summer day; cloudy evening, few spots of rain about 10 P.M.
31st.—Slight rain and close damp morning, continuing very dull and heavy until 4 P.M. when it became clear and bright; very fine evening.
1st.—Heavy rain in night; close damp morning, fine bright afteraoon and evening; monlight night.
2nd.—Very fine bright day; cloudy evening, alight rain 6.45 P.M.; lightning in west from 10 P.M. and from 10.30 P.M. brilliant in N.W. and S.W.
3rd.—Lightning continued with increasing frequency, and thunder was heard at 0.15; rain began at 1.36 A.M., and the storm disappeared about 2.30 A.M.; very close morning, but fresher in evening.
4th.—Damp and dull morning, afterwards very bright and fine.
5th.—Very gloomy and dull; rain commenced 6.15 P.M., continued till 9 P.M.; fine afterwards.
The warmest week this year, being at last slightly above the average temperature.—G. J. SYMONS.

COVENT GARDEN MARKET .- AUGUST 6.

TRADE is quieter, the bulk of the soft fruit with the exception of Red urrants having reached us, and prices show a downward tendency. Vegetables are in good supply. FRUIT.

From observations taken near London during ferty-three years, the evenue day temperature of the week is 78.0°; and its night

THE WRATEER AND ITS EFFECTS.

BITTERLY cold and unusually long winter has enabled us to test the power of endurance which some of our pet plants have exhibited, resisting all the attempts of Jack Frost to kill them; and now a wet cold summer shows us what plants in the flower and vegetable gardens delight in the prolonged downpour of almost uncessing rain. An article in the Times of last week on the general state of

things in the farm and garden was evidently written by someone who had gone out for a day's pleasure in the country and had met with nothing but "water, water everywhere," and downhearted farmers and lugubrious gardeners, and then came home, overwhelmed with dampness of spirit, to vent his dejected thoughts in a dreary account of what he had seen and heard, written off to the Daily Thunderer. Things are no doubt very bad; but I must say I for one am not sorry, but thankful to have wallfruit trees, for they are laden, some of them, with a very respectable crop of fruit. I never had so many Apricots, nor more Peaches, nor so good a crop of Pears. I had two years' supply of Plums in one last year, so I did not expect many this, and consequently there is no reason to be disappointed in seeing the trees with scarcely any fruit on them. Cherry trees are on one wall cropped heavily, on another equally heavily blighted. The west aspect is a success this year, the due north a failure. Black Currants abound, notwithstanding a large destruction by blight; Raspberries are plentiful, and Strawberries have not been

Perhaps the best way to judge of the fruit year is to take a glance at the jam cupboard; if so, according to the report of the housekeeper, it is an unusually good year for jam; but later on she will sigh over the absence of Plums, which last year were so numerous that she got tired of them, and our good friends and neighbours profited thereby. I find the Siberian Crab one of the most uncertain bearers. I have a fine tree on the lawn, and sometimes it is loaded with fruit, which are both delicious as a preserve and most beautiful for decorative purposes. They look like Cherries with a lovely bloom upon them, and the church decorators at the harvest festival are always much disappointed when they cannot get them. This year there are certainly none, though the tree flowered well; there were none last year and but few the year before, so let us live in hope that Siberian Crabs will be plentiful next year.

The poor farmers of this district, where there is but little arable land and hay is the great summer harvest, thought in May that they should at all events have large crops of Apples, for the immense orchards about here never looked so beautiful as they did in that month, when the branches seemed almost weighed down with the burden of blossem alone. Then, too, there was a general im pression that the blessom, coming as it did about a month later than usual, was sure to be unusually productive. But, alas! all the hopes of spring are falsified by the event, for a worse year for Apples was never known. There

NO. 909.-VOL. XXXVII., NEW SERIES

will be little of the fameus Gloucestershire cider made this year.

I remember a quaint old farrier in the far west used to say, "You must doctor an 'oss just as you would a Christian." But if men and horses bear the same treatment it is quite certain that the weather which suits human life is had for the vegetable creation: never has the church bell tolled so seldom for the funerals of my parishioners as during this wet summer. It has been evidently cool and healthy. The sold winter carried off the aged—over a hundred years one of them—but this cool wet summer has suited all. The same thing may be observed throughout

With regard to flowers, I notice that Clematis Jackmann is very good, loaded with a quantity of bloom; it is always an abundant bloomer, but this year it is unusually fine. Then one has had no trouble in watering even the Marie Louise Violets, which generally require constant attention; and all the subtropicals, except some specially delicate plants like Draosena terminalis, have rejoiced in the abundance of moisture. The huge leaves of Ricinus are stronger than ever, and Cannas are very beautiful.

The large stately Lime trees in the churchyard are at the present moment loaded with their fragrant blossoms; and the bees, which on the whole have not had a very good time of it, are rejoicingly busy now at the latter end of the season gathering honey and pollen from those sweet flowers. It has been very pleasant during the last few hot summer days to stop for a moment under the shade of the grand old trees and listen to the constant hum of bees, which are busy by thousands in the branches overhead. The quantity of honey stored away at the end of the season from Lime trees almost makes up for the want of Heather, which is, however, a still better honey-producer in the late autumn.

In speaking of the kitchen garden I omitted to mention that the only things really suffering are Cucumbers and Tomatoes. The former have had mildew, which my factotum gardener says he never saw before among his Cucumbers. Tomatoes do not set their fruit so well as desirable; they have grown well, and the last few days of sunshine have done them much good. Peas have prospered immensely; but once more Dr. Maclean is all but a failure with me, and the above-mentioned factorum says, "Us better have no more of them doctors, sir;" and I believe he is right.—A GLOUCESTERSHIEE PARSON.

RIPENING LATE GRAPES.

It will, I think, be new to most of your readers, as it certainly is to me, to learn that I teach "the necessity of high temperature for Grape-growing during dull and sunless weather," and I fancy most people will give me credit for erring rather in an opposite direction: 55° as a minimum temperature is not usually thought high for Muscats while in flower, and I know many good Grape-growers who would not find much comfort on their pillow if they thought their houses at such a critical time were below 70°. I do not recommend much forcing till the flowers are set, chiefly

NO. 1611.-VOL. LXIL, OLD SERVES.

because the roots of Vines never commence growing till some of the leaves have attained nearly their full size; and in some cases, where an extremely high temperature is maintained while the roots are cold, the Vines, I should imagine, nearly come into flower before there is much root-action, and hence all the cry about Muscats and some others setting badly. Bad setting of Muscats is unknown under rational treatment, excepting in cases of accident which the best of us are liable to.

What I recommend, and what I would urge with greater force now that the long days are fast slipping away with hardly a glimpse of summer, is that Grapes which are intended to be kept through the winter should have plenty of assistance given them by means of fire heat, for the sun this season is not nearly sufficient to ripen them. To have them coloured is not enough; the temperature must be kept up to a minimum of 65° for fully ten weeks after they commence colouring, and then if the ventilation has been well attended to and all else goes on well the greater portion of the leaves as well as the fruit will be ripe. The varieties named by Mr. Peach, with the exception of Muscat of Alexandria, do not come under the heading of "late Grapes" and will ripen with ordinary treatment; but even Black Hamburgh in a season without a summer would be better for having fire heat till colouring commences, not so much for the present crop if it is intended to use it before the new year as for the future well-being of the Vine. It is not everyone who has such a beautiful light house as the one Mr. Peach describes, and in a season like the present one a light house has an immense advantage. again I say, Fire away, not because you like it, but because under the exceptional circumstances it is a necessary evil, and fire heat can be used more economically for ripening the wood in August than it can in October or April.

I hope some day to have a word with Mr. Peach as well as

with "A NOETHERN GARDENEE" about pruning and pinching, or rather, what it must come to, "extension versus restriction." I am extremely pleased to find a fundamental point of dif-ference between "A NORTHERN GARDENER" and myself, for some of his articles are so provokingly like mine that on looking over old numbers I feel sometimes disposed to dispute

the authorship.-WILLIAM TAYLOB.

DUPLICATE ROSES.

"A. C.," in one of his interesting letters, advises Mr. George Paul to add to his list of duplicates Fisher Holmes and Duc de Wellington. Whilst allowing that these Roses are very similar in colour, I should hesitate to endorse "A. C.'s" opinion. I have recently spent several hours in Mr. Walters' nursery for the express purpose of discovering the difference between Roses which are so much alike as to be almost identical, and I will give your readers the result of the few notes that I made

not, indeed, on paper, but in my mind.

I must state, however, that Mr. Walters does not label his Roses except with numbers, therefore it is necessary either to be accompanied by the owner of the place or else to take the book which gives the names and numbers. As I used to o early in the morning whilst Mr. Walters was at breakfast, I took his book, and went through all the lines one by one. never looked at the book unless doubtful as to a Rose, and I must own that at first I was bothered by the similarity of the two Roses referred to; but on looking at the wood of both Roses I found that, although the wood was much the same, the foliage was different. Fisher Holmes had a more glaucous er sheeny light in the foliage, whilst the Duke was much duller and darker. I think "A. C." will find this distinction in his plants if he will look carefully at both together. Perhaps also the blooms of Duc de Wellington are more "built up," more globular than those of Fisher Holmes.

I now come to what I may call the Lesseps family. Here we have four Roses very much alike—viz., Maurice Bernardin (the oldest), Exposition de Brie, Ferdinand de Lesseps, and Sir Garnet Welseley, the youngest and best. With the exception of this last named I for one could distinguish no difference at all between any of the three former either in the blooms, the wood, or the foliage. Sir Garnet is, indeed, quite dif-ferent in wood and foliage, and is an improvement in colour, but in the majority of plants very like the rest of the family. But the other three are identical. I cut branches of one to compare with the others, and I could find not the slightest difference. I remember years ago, in course of conversation in a railway carriage on the road to Hereford, Mr. George Paul

said, "The sooner Exposition de Brie, Ferdinand de Lessens. and Maurice Bernardin are called by one name the better. can find no difference in them, but my budders say they can." I asked Mr. Walters his opinion, and he said, "You might cut three blooms from the same plant of any of them, and show them under the three names, and no one could discover the I then asked his son, who is the principal budder, if the could find any difference in the wood, and he said, "Not the slightest." It is time, then, that these three should be called by one name, and that men should not have to buy plants of each.

I now come to Mdlle. Eugénie Verdier and Marie Finger. Mr. Walters pronounces these to be identical. The only difference I could find was in the form of the two flowers. Marie Finger is a little flatter than her sister, but the wood and colour

are exactly the same.

The next Roses that force themselves upon my attention are the grandest of all Roses—Charles Lefebvre, and his young sister Marguerite Brassac. Here I own I can discover no difference at all. Charles Lefebvre is the stronger grower as it

appears to me, and that is all.

I now come to Roses sent out by one of the greatest Rose nurserymen of the present time, Mr. G. Paul. Before mentioning the names of two of his Roses I must once more observe that my notes are taken from observations at one nursery. It is possible, as Mr. Walters says, that I may have cut my buds from the wrong line, and people have been in here saying that their blooms of Sultan of Zanzibar were quite different from mine. I know I shall render myself liable to being over-whelmed by the outpouring of the vials of Mr. George Paul's wrath, and a score of rosarians; but, to be strictly honest, I must say that I can only discover the slightest difference between Reynolds Hole and Sultan of Zanzibar. On comparing the two, and talking over the matter with Mr. Walters, the only difference I could find was the colour of the wood at the top of the flower stalk. Reynolds Hole is brown, while the Sultan is green. Both are splendid Roses, and I only hope I am wrong; but at Mount Radford, with the above exception, they are identical. Roses which bothered me very much and which I could never be sure of the names, were Abel Carrière and Jean Liabaud, Lord Macaulay and Auguste Neumann. I allow that there is great difference in the wood of these two latter, but often the blooms when young and at their best are much alike. Mons. E. Y. Teas, a great gem, is somewhat like, in both wood and colour, Madame Victor Verdier. Each has white thorns, but the Monsieur is much more thorny than Madame, which is an exception to the rule in life so far as my experience goes. Dupuy-Jamain again, and Auguste Rigotard, are very similar both in wood and

Concerning new Roses I was unable to make any comparisons, because Mr. Walters grows very few; but I may mention one Rose which appears to be identical with Antoine Ducher; this, I think, is called Mdlle. Louise Pernet. It seems a pity that nurserymen should send out Roses which, if not duplicates, are so much alike that you require a microscope to find out the difference. Of course, for a nurseryman's seventy-two Louise Pernet, Marguerite Brassac, and Marie Finger are exceedingly valuable, but for the man who only grows Roses to decorate his garden they are useless. As the exhibition season is now over, and the demands upon your space are not so great, perhaps this letter may excite discussion, and more duplicates may be added to my already long list.—WYLD SAVAGE.

SCORCHING AND SUMMER PRUNING.

THE timely and instructive remarks which have appeared in the Journal of Horticulture as regards the effect of sun cannot but have been useful; for it is only by the most careful attention and judicious ventilation, and even slight shade, that scorching can be averted on the sudden appearance of sun. The amount of crude sap in the leaves of Vines this year is very exceptional, hence any warning is certainly seasonable. Never perhaps any season has the effect of the sun been so visible as it is this year. We have planted in an open situation a collection of the choicest sorts of Ivies, and the bright sun of the last few days has scorched them as effectually as if they had been in a glass case; also in rambling through our woods I find in open spaces, where the sun can easily penetrate, the young growths of the common Bracken and several of the Lastreas are completely scalded and burnt brown.

It will be wise to take the advantage of every opportune

occasion to advance the summer pruning of all kinds of fruit trees, so that the necessary fruit buds may be matured for next year's crop. Not a branch or shoot more than is required should be allowed to remain after this date; also every means should be allowed to remain after this date; also every means possible should be resorted to to give Peaches on walls an opportunity of ripening, for which purpose it will be necessary to expose the fruit as fully as possible to the sun, and in no cases should more young wood be left than is necessary for next year's produce. Unless we have much better weather than we have had as yet all the horticultural skill possible will have to be exercised to produce a good crop of fruit next year.—B. Cowan,

A NEW HEDGE CUTTER.

WE have great pleasure in introducing to the notice of our readers an implement which will be regarded by many as a in two rows, and in a third row they were sown in mixture,

great boon as great boon as the hwn mowers when were superseded the nee of the scythe

in garden . There are not many who can use skilfully the hedge pruning hook or the shears; and to those who can, and especially to ladies, the labour is so great that any contrivance which will enable them to perform the work with comparathem to perform the work with compara-tive comfort to themselves, and at the same time afford a pleasurable recreation, must be a great acquisition. We have been favoured by Mr. Ridgway of Macclesfield with one of his new patent bedge cutters. We have used it, and therefore we can speak of it experimentally.

The principle of its construction and application is the same as that of the mowing machine or the horse chipper, and used in the way of the latter it performs its work most effectually and rapidly. Every action of the machine does work, and in this respect it differs from the shears, which only cuts with the closing motion. In the hedge pruner both motions do the cutting, and hence there is a great saving of labour. The implement is light to handle, acts with great freedom, and does its work thoroughly and quickly.

operator may keep on walking at a slow but constant pace, all the time working the machine and cutting the hedge. No garden establishment, however small or large, should be without one or more of these useful implements.

TELEGRAPH AND TELEPHONE PEAS AT ORSETT HALL.

WHATEVER may be the case in other places, there is no question whatever that these two Peas are quite distinct as grown in the garden of B. B. Wingfield Baker, Esq., by Mr. iggulden. No one being free from prejudice, and who has any practical knowledge of Peas, can after a full and fair examination of the two varieties say that they are identical. It is admitted that the dried seeds are different—Telegraph being smooth and Telephone wrinkled—and there is at least quite as much difference in the colour of the pods, the colour and appearance of the Peas when shelled, also when they are cooked, and especially so in regard to quality and flavour at table. Both are grand Pess, not for exhibition only, navour at table. Both are grand Peas, not for exhibition only, but for ordinary supply and culinary purposes where Peas of great productiveness are required by the gardener, and dishes of fine appearance and superior quality are coveted by the cook. Mr. Igguiden has found these Peas most valuable and has grown them extensively. Sown at the same time as William I. they form a natural accession; and the cultivator referred to, who is admittedly a coveratent; indeed considers them. who is admittedly a competent judge, considers them to rank very highly amongst second early varieties, as they are not excelled in quality by any others and are unequalled in size. The two varieties attain the same height and mature their

pods at the same time; indeed in growth they appear nearly identical, the only difference being that the foliage of Telephone is somewhat lighter than that of its prototype. But the pods and Peas are quite distinct. The pods of Telegraph are dark green, those of Telephone being decidedly paler—namely, a greenish white. So marked is the difference that if a number of pods of the two varieties are missed to the them. ber of pods of the two varieties are mixed together they can ber or pous of the two varieties are intent digenter diey can be separated with the greatest case. If possible the dissimi-larity is still greater in the case of the Poss. If both varieties are shelled into the same vessel and thoroughly mixed every almost white Poss of Telephone can be picked out with the estest readiness from the green Peas of Telegraph. difference in this respect is so complete that both varieties cannot be sent to table in the same dish without spoiling its appearance. At Oreett the two varieties were sown separately

but from this mixed row not the slightest difficulty is experienced in gathering a dish of which-

ever variety is required. When the Peas are cooked there is also an unmistakeable difference in both their appearance and quality—Telegraph is smooth and green, Telephone winkled and white. In flavour the former is excellent, being sweet but having a suspicion of mealiness enjoyed by some palates; the latter is decidedly more buttery and sugary, and would be generally preferred by Pes connoisseurs. In this respect (flavour and quality) anyone having contracted of the contraction of the lity), anyone having experience of the two Peas would certainly determine "which was which" by eating them in the dark that is, without seeing them at all. When dishes of the two varieties are placed on the table the Peas of Telephone are seen to be larger than the other; but the most striking dis-similarity consists in form, colour, and flavour. Telephone is considered by Mr. Igguldan to yield rather more pods than Telegraph, but they are not larger if quite so large as those of that noble Pea.

The cultivator in question, who grows Peas largely and well both for exhibition and home use, intends growing these two fine varieties more extensively—Telegraph in consequence of its colour being the best

for exhibition; the other on account of its quality, being preferred for the table. He thinks Mr. Culverwell deserving of high honour for raising such a splendid Pea as Telegraph, but considers that he ought to have done what Mesers. Carter & Co. have done—namely, have selected more carefully and sent out a stock of indisputable purpose. which Telegraph, before it was dealt with by the firm in ques tion, certainly was not.

Mr. Iggulden in discussing the merits of Peas, as he will do shortly, will probably refer to these amongst other comparatively new sorts, when it will be seen that he has no preference for the productions of any one firm of seedamen over those of another, but that he forms his estimates with absolute impartiality, and after actual practice and close and careful observation.

It may, under the circumstances, perhaps be advisable to add that I am not a client of Messrs. Carters', and have no connection whatever with that firm; my only object in writing on this subject being to record, as far as I am capable of judging, what I believe to be—TRUTH.

SLUGE-CROP PROSPECTS.-"G. O. S." asks for a preserva-SLUGE—CROP PROSPECTS.—"G. O. S." asks for a preservative against slugs. Obtain some plowers, clip their wings and place the birds in the garden. They will work successfully in devouring the slugs. My Strawberries have, as everywhere, been abundant; and the British Queen, usually so shy a bearer, is now giving me quantities weighing an ounce a-piece, and Constants promises well. We have had enormous crops of Raspberries, Gooseberries, and Currants (Black and Red); also unusually numerous Apricots and Pears. Enough of Plums,

Peaches, and Nectarines. No Apples. Potates plentiful, and as yet without disease. Asparagus was excellent, and lasted some weeks longer than usual. Globe Artichokes were entirely killed by the frost.—G. H. V., Retford.

A REAL ROSE GARDEN.

If the English people only knew what a fine country they have they would not be in such a hurry to go abroad without seeing it. Such is the reflection that has suggested itself to me as the result of a short sojourn amongst the Cotswold Hills. How little in general is known of the beauties of that part of Gloacestershire! Passengers by the Great Western Railway to look out and admire the lovely Streud Valley; but how sew know that there are many other lateral valleys hardly less charming, with parks and places suddenly appearing, each in its own little wooded valley, generally with a stream through the midst offering added attractions. And the soil of these valleys is remarkable food for Roses. "Here," said my hostess, before taking me to see the real Rose garden, "here my Roses grow to please me; when we came in the valley they grew to please themselves. They could not help growing, and the colour had a depth and richness which I have never since equalled."

As the fair owner had encountered the great Cranston with a box of thirty-six, and with no inglorious issue, she could speak with authority. After this we proceeded to the real flose garden. I had gone over the grounds as I thought up to that moment, and seen some good Roses, but not quite in that prominence which of course I had expected, when suddenly we descended the side of a hill through a fernery, and past several beautiful limpid rills, and all at once came to the door of a compact and tall walled-in enclosure. The door opened upon a sight of beauty which will remain with me a joy for ever. The whole of the interior was filled with beautiful Roses! Nothing else was allowed there, no inferior beings except some serviceable Strawberries, which there is Cheshunt authority at least for having in such a neighbourhood. The dark Roses were especially fine, though not all of the newest kinds, for since ceasing to embibit, old friends had been more tolerated. Général Jacqueminot was in magnificence. Anna Alexieff as I have never seen it, a long hedge, which but for the usual morning rains would have been in perfection. Lord Clyde was also grand; La France of course, and various others, which it would be long to enumerate.

The plants were chiefly on the Briar, trained to long rows of wire, with rows on their own roots in the midst of these. A magnificent Maréchal Niel occupied the place of honour near the entrance door, having had the wall coped with old frame lights for his special delectation.

I take this opportunity of remarking that having now bloomed Reine Marie Henriette, my impressions in its favour are strongly confirmed. I obtained three plants in the spring from Mr. George Paul. One was crippled by the weather; one under a south wall is growing quite as vigorously as the Gloire de Dijon; and one has just given me a beautiful bloom, very like Souvenir de Pavid in colour, only of three or four times that substance.—A. C.

THE SEASON AND THE FRUITS.

I HAVE heard of a man, angered by constitutional gout, who when asked "How is your gout to-day?" was wont very uncivilly to reply "I wish you had it." I also knew a good-numoured man, one of the best fellows I ever met with, who used to say, "How are your Potatoes this year?" and if he had the answer "Very bad," he would reply with a sly twinkle "I'm glad of it, for so are mine." The former anecdote was given in earnest, the latter merry banter. I suppose according to our nature are our feelings this bad season. In regard to our gardens, to my own mind it was quite cheering to read Mr. Peach's account of his garden success, and I half wished myself from my present Bath neighbourhood even in York-shire—from south to north, which few of us southerners are apt to wish. "All the worse for your bad taste," possibly a Yorkshireman may reply.

I think that the difference between Yorkshire and warmer North Wilts, especially my part near Bath, is a reason why a difference of pruning may be necessary to cause success in the cultivation of pyramids. I see no reason for altering my plan in regard to pruning. It is this: I receive the tree from the nurseryman trained as a tree; I simply cut clear away any

branch that grows across, and also any that hindens light and air passing through. I have at this moment an Irish Peach Apple tree heavily laden with fruit, which tree during the five years I have had it I have never touched with the knife, as it naturally grows free from crossing branches. I would observe by the way, for the comfort of pyramid growers, that on trees of this form and this form only have I any fruit. My large standards are fruitless. By not pruning hard or planting very near for protection I obtain large pyramids; and size of tree being gained, a greater abundance of fruit is the result. A dwarf tree cannot preduce many Apples or Pears, it is too small for that happy result. I rejoice in Mr. Peach's success, and do not doubt but that in his climate his close planting and hard pruning have something to do with that success.

and do not doubt but that in his climate his close planting and hard pruning have something to do with that success.

Next, up to the present time how stands the fruit crop? Then, considering the lateness of the time of the year, how about the fruit crop not yet ripened? As to the present I am bound to say that Currants, Gooseberries, Strawberries, and Raspberries have in spite of the want of sun ripened fairly, but the flavour is not as good as usual, particularly of the Raspberries. There is a watery taste and a want of rich flavour. All these fruits have come in later than usual, but they have come in at any rate. So far so good. The housewife and the cook may rejoice in their full jam pots. Nature will always recover herself and make up for loss when she can, but it is only when she can. Time hurries on, and time is against her now.

Thus, though Roses have opened without sun and bush fruit has ripened, both have been much later than usual, having had to take more time for their work; but how about the future? Soon will September be here. Shorter days are upon us and longer nights; therefore, however wasm the days may become, yet the nights must be colder, and hours sad hours less of the beautiful daylight. Is it possible, then, that the Plums and Pears, now very small and very hard, can be ripe before the fall of the lest, when Mature can do no more for them? I fear not. They have not time to make up for former loss as the earlier fruits had. Summer Apples late and not good there may be, and some early Pears—which will be medium season ones this year—but all other fruits I own I give up as lost. My advice, then, to materiasmilias is to preserve without delay abundance of Currants, Geomeberries, Raspberries, and Strawberries, for Plums and Damsons will be few. I hope I am wrong, but I fear I am not.

In regard to pruning the trees, which have this year grown too luxuriantly—even coarsely, I quite coincide with "A NORTHERN GARDENER." This is an exceptional year, and if the branches be not kept very thin the wood usamot ripen, considering the absence of sun and the continued lowness of the temperature. Thin out, then, without stint, and shorten the branches if that be your system; at any rate, thin out industriously. As "A NORTHERN GARDENER." says, "The remedy for crowded trees and imperfect spurs and foliage is the knife, not applied in winter after the injury has twen done, but now—in summer—when it may be prevented."

One final word about the vegetables. The Potatoss in this district were fine, the leaves perfectly green, and roots good until the great thunderstorm of August 2nd. In a few hours the leaves were brown and mischief began. As to the Peacrop, as seen at a distance it looks like one of those tempting pictorial advertisements where the Peas are hanging in vast abundance; but come near, and you will find the pods only half full and many not even that, also the flavour wanting. I will finish with an anecdote. In June I met a huenorous friend of mine—an old bachelor clergyman, who might take for himself the motto, "Let there be more plain living and high thinking," for he fulfils it—and I asked him about his Potatoes. "The old ones," said he, "are gone, and no new ones to eat, so I live upon rice and hope." Perhaps not all our seaders may case to live quite so plainly; but in gardening we may, in spite of the bad season, "live on hope" of a better time next year.—WILTSHIERE RECTOR.

WORMS IN BOWLING GREEN.

If your correspondent (see page 89) who writes about worms on a bowling green will take forty gallons of pump water, 1 or. of corrosive sublimate dissolved in a little het water, mix all well together, and apply with an ordinary watering can in the evening or after a shower, he will find the worms disappear and the grass will not suffer any injury. We believe the large lob worms have appeared in greater quantities and caused more

trouble to gardeners this season in consequence of the continued rains than for many years past.—Dick RADCLYFFE & Co.

REESTON HORTICULTURAL SOCIETY.

ADGUST MIL

The seventh annual Show of this Society took place on the above data, and we must say it was far in advance of any previous exhibition hold here. Boses being the special fusture of attraction, the Committee had determined to have a Rose show if pensish, and their attempt was enoursed with success, bringing tegesher so is did the count of the midhed and north midhed ansatzer growers. When such ardent lovers of this beautiful Sever as the Roy. R. M. Poekin, Oknon Hele, and Mr. A. Soames exhibit we may expect to see sensithing above the average of village above. These were two classes open to all contested. In Class I, for iventy-four distinction being extremely class. The highest price was obtained by the Rev. R. M. Poekin, in when how we neticed a seamethally fine bloom of Due de Wellington, which was very good in endour and of a size sellow obtain, which was very sood in endour and of a size sellow obtain, which was very good in endour and of a sea sellow obtains obtains.

The highest price was obtained by the Rev. R. M. Peekin in whose box was staged, the competition being extremely class. The highest price was obtained by the Rev. R. M. Peekin in whose how we noticed a remarkably fine bloom of Duc de Wellington, which was very good in enfour and of a size settlem obtained for the following varieties:—Paul Reyron, Alfred Colomb, Marguerite Brassac, Reynelds Hole, Baltane C. Jeignessen, and Madame C. Wood. Mr. A. Sommes was a good escend with blooms searcely interior to the above but vanishes a State in form. Among them we noticed as being very fine Severaite d'Elise, Marie Rady, Marie Daumann, Le France, Marganila-Brassac, he Envey, and a new Tax of 1878, Madame Leminal, which we think will prove a decided acquisition to the December of Well was placed think. His blooms had evidently unflaved severely from the heavy sterms of the heat few days; his stand; however, contained the passier bloom is the dass—viz., Amnie Wood, with substance and colour that are xanety seen in this variety. We also noticed Marie Register. Glassies Lafebove, Horsoe Vernet, and Dr. Andry as lainer very fine.

leting very fine.

In the class for twelve dissimilar varieties the competition was much stronger, eleven boxes being staged. First honouse were elimined by Mr. Scames; the second price was awarded to a local ameteur, Mr. F. Sprey, clevely followed by Mr. Poshin. In the class for cottagers life. Sprey showed a remarkable six, which included a superb bloom of Charles Lefebrre, to which a special pains was awarded as being the finest bloom in the whole Habitation. Mr. H. Frettingham, nurserymam, also enhanced the beauty of the Show to a considerable extent by the quantity of blooms he displayed not for competition, centaining many new and choice varieties.

Ferns were also a special feature of the Show. R. J. Lowe, Eqq., of Eighfield Park, staged a fine collection of British and exotic vanishes not for competition. On the whole we think the Show was a desided succes, great credit being due to the exertions of the Committee and their President, S. Watsen, Eqq., under whose management so much has been achieved.—Resarias.

THE LATE STORM-GLASS STRUCTURES.

FOR the last ten or twelve years the glass houses in this place for fruit, &c., have not suffered in any way from hail; they are built of the wedge chape, and hail glances off without injury to the glass. Most of these houses are from 7 to 8 fast wide at the bottom and from 2 to 4 feet at the top; some are open at the top and others closed, with proper ventilation at top and bottom. After the first year it is most unusual to find a square of glass cracked. The rafters of these bonnes are grooved for the glass, which is merely slipped in without putty or laps. The glass is kept firm by a thin piece of copper being driven into the gnove between each square (i.e., between the abstract) on each side. These houses have raceived no attention whatever since they have been exected, the wood having been made imperishable by creosote; they are of the most economical description; we have one 130 feet in length. Every year it has produced fine crops of Peaches, Nectarines, &c., of perfect flavour and of large sise. The first house I constructed on trial; it has in it one Peach tree, Marquis of Downshire, bearing this year 300 fruits, and the other tree, a Royal Ascot Nectarine, has 150; this little place is open at the top and also beneath the glass. The air flows up between the tree and the glass. The only pretection given to the house during the frosts was some old sacks. These houses, when closed at the top, can be shut up after three o'clock, when the heat often rises to 100°. As the tage of the sun glance off (the buildings run north and south) not a leaf is scorched, and no red spider ever appears, excepting at the south end, which is syringed with buttermilk, which remains on the glass of all our houses more than a year, and it

slightly but efficiently obscures the sun's rays. We have hell no occasion to use this fluid this year; even after so much rain a film remains on the glass.—OBSERVER.

NOTES ON STRAWBERRIES.

LET me add a few more words about Strawberries in answer partly to "AMATEUR, Cironecstor." I cannot altogether agree about his selection. I have tested every one of the Strawberries he names, and have entirely done away with Keems' Seedling, for though no doubt a good beaver, yet the flavour, to my mind, is so inferior I should never care to have it on my table any more than Black Prince. Sir Harry, again, is a vary inferior Strawberry, and after two or three years' trial of La Canatante it was such an uncertain beaver with me, and of inferior quality, that it too was condemned to the rubbleh keep.

I can strongly recommend Rivers' Elim as a late vaniety, very large, and very prelific. Some that I only planted last autumn—and, as I think I have said, I put three plants in 6 inches apart for each stool instead of only one—are in full bearing, having greater crops in fact than two and three-year-old plants. On my trial ground my rule is to cut out any I da not like, and plant news of others alongside those I do; thus Souvenir de Kiaff, Sir Charles Napier, Wonderful, Myatt's Prelific, Eleanor, Sir Harry, and Ameter have all been discarded. By far the best Strawberry I have is Lacas; quita as high coloured and much better flavoured than Sir Joseph Bassion, does not straggle, has a short stiff flower stem, beautiful dark green foliage, will produce more on the same space of ground than any other Strawberry I know, and holds the fruit well off the ground. Sir Joseph Paxton this year with me has evopped heavily, but has straggled and run so that it has been difficult in the extreme to avoid all the berries decaying on the ground, though I must own it is an undeabtedly good Strawberry.

My present selection would be President, Lucas, Sir Joseph

My present selection would be President, Lucas, Sir Joseph Paxton, Garibaldi (alias Vicomiesse Héricart de Thury), James Veitch, Crimson Pine, Harly Crimson Pine, Sir J. Halstaff, Coxcomb, Traveller, Newton's Seedling (especially for preserving), Rivers' Eliza for late—indeed Coxcomb, Traveller, and Eliza are all late, as is also the old Elton Pine, which ought never to be omitted in a large list of Strawberries.

La Grosse Sucrée has done well with me, in fact I may say I have not a failure in twenty-six sorts this year. These are other sorts of Dr. Roden's which I will report on more casefully another time. Out of twelve sorts there is only one I feel at all inclined to discard. I did not begin gathering this year till the 22nd of July, but, as far as I can at present judge, I shall have Strawberries from Rivers' Eliza and Coscomb in September, also from Trayeller and Newton's Seedling.

One thing I may advise "AMATEUR"—that if, instead of adding Currant juice, he will only adopt my plan—i.e., a quarter of a pound only of sugar to a pound of Strawberries, and use chiefly Garibaldi and Newton's Seedling—he will not find the Strawberry jam too luscious. No greater mistake is usually made about preserves than the old-fashioned rule of a pound of sugar to a pound of fruit, a sort of rule of thumb order handed down from old days. No ripe fruit ever requires more than from a quarter to half a pound of sugar, and even green Goessberries and unripe Plums are better for not having too saust sugar with them. As I have preserved already about fifty pots of Strawberries this year I can speak from experience on this question.

As for applying liquid mannre to Strawberries it is, as a rule, a mistake, encouraging too much foliage. I never water the plants, but only madeh with manuse in the winter, and not too early, lesting them have all the sun and air they can in the autumn. In a very day season do not cut off the runners or lesves too close, but in a wet one try and keep every plant as distinct as possible. As "AMATRUE" appears to possess Lucas let him take my advice and throw away any other Strawberry rather than it; but then he must be sure he has it true. There is a variety, something like an improved Keens' Seedling, sent out in some cases, instead of Lucas. As for "AMATRUE'S" advice about Keens' Seedling, I will guarantee to get with six of the Strawberries I have named a heavier crop on the same space of ground than Keens' Seedling swer: bore or could bear, I mean by weight, and have Strawberries twice as large; and if in number both Garibaldi and Newton's Seedling would easily double it.

I may add in conclusion that while agreeing in the main with Mr. Laxton, I can only say President has never failed to set fruit every year with me, and has as heavy a crop as ever.

I weighed another fruit yesterday (12 oz.) off a three-year-old bed, and I have a bed now nine years old, which I keep as a curiosity, still in full bearing. I should like to try some of the sorts he names, if he would like to exchange runners with me for others.-C. P. PEACH.

NATIONAL CARNATION AND PICOTEE SOCIETY'S SOUTHERN SHOW.

To say that the Exhibition that was held in the Royal Horticultural Society's Gardens at South Kensington on Tuesday last was superior to any that has been held before is not wide of the mark, the flowers being much more numerous than they have been at any former exhibition since the southern Show was resuscitated some three years ago. There was also a considerable addition to the number of exhibitors. The flowers also generally were finer grown and better set up than I ever remember to have seen them.

In the class for twenty-four Carnations Mr. Turner, although possessing the largest flowers, was considered only equal to Mr. Dodwell, and these exhibitors were both very properly adjudged Dodwell, and these exhibitors were both very properly adjudged first prizes. Mr. Douglas's flowers generally were past their best. The flowers were superb indeed. I never remember to have seen finer. In the corresponding class for twenty-four Picotees Mr. Turner was very properly first with immense and very fine flowers, followed closely by Mr. Dodwell, whilst Mr. Douglas's Picotees seemed to have lost their freshness. Amongst the young growers Mr. Arthur Medhurst set up a splendid stand of six Car growers Mr. Arthur meanurst set up a spiendid stand of six Carnations, and also of six Picotees, closely followed in both by Mr. W. H. Dodwell, whilst Mr. Burnaby Atkins was a good third. A somewhat strange circumstance, and more particularly so to northern growers, was the great increase in the number of Selfs exhibited. In addition to the great increase there was also a decided improvement in the quality of the flowers represented by a couple of stands at the first Exhibition. At this Show the stands numbered five of twenty-four blooms each, five of twelve each, and an immense stand of thirty-six blooms, whilst in single blooms six singles were shown, and a beautiful Self white.

The prize for the premier Carnation was awarded to Mr. Turner for Sibyl, R.F., and when I say that it was a far finer flower than the one which won premier two years ago I think I shall have all those with me who recollect that fine flower. The prize for the premier Picotee was awarded to Mr. James Douglas for Mrs. Payne, a medium feather-edged Rose of good substance and im-

mensely large petal.

mensely large petal.

The yellow ground in Picotees is also taking a decided lead, and I fully expect to see that we shall have a class of yellow ground Carnations and Picotees with flowers equally good in quality as those with white grounds. Upwards of twenty years ago the late Dr. Horner, father of the present Rev. F. D. Horner, strongly advocated their cultivation, and one of which I considered his best problems of the reliable strategies are strongly advocated their cultivation. articles was written recommending the culture of the yellow Picotee.

articles was written recommending the culture of the yellow Picotee. Of the newer sorts exhibited the following are the most noteworthy:—In scarlet Bizarres Mr. Dodwell had in his stand one named Charles Turner, a seedling from James Cheetham, which it resembles very much in shape of petal; the colour, however, is much deeper than that variety. It is a noble broad-petalled variety, and when it is distributed no stock will be complete without it. Another one—a seedling from Dreadnought—named Job Matthews is also a sterling flower. Mr. Dodwell also won second honours in the classes with a seedling, a brilliant flower. This sort I take to be a first bloom, as it had 1879 on it. Mr. Dodwell also exhibited several other seedlings also of great promise. In crimson Bizarres Mr. S. Buttram exhibited one called Randolph, rather rough but very fine in colour. In Picotees Dr. Abercrombie exhibited by Mr. Turner was extremely fine, winning first in the class. Mr. Dodwell again exhibited the variety called Novelty, and a novelty it is, a fine-formed flower with a violet-coloured edge. He also exhibited a seedling rose-edge of great promise. In Selfs there were a number of good seedlings from Messrs. Turner, Hale, and Hooper. The following first-class certificates were awarded:—To Mr. Charles Turner for Picotees Dr. Abercrombie, H.R., Baroness Burdett Coutts, M.P., and perpetual Coronet. To Mr. T. S. Ware for yellow perpetual Chromatella, and to Mr. Wilmer for Olara Penstone, L.P. I can only say in conclusion that I hope the Society will go on prospering as it has done, when we shall be able to say that florist flowers are at a premium instead of a discount in the south. A list of awards and the principal varieties is appended.—Geo. Rudd. Of the newer sorts exhibited the following are the most notethe principal varieties is appended.—GEO. RUDD.

CARNATIONS—In Class A, for twenty-four blooms not less than twelve dissimilar varieties, Mr. Charles Turner was placed first with Sybil, Squire Trow, James Taylor, Mars, Braidsley Hero, Clipper, J. D. Hextall, Florence Nightingale, John Keet, Mrs. Brown, Sporting Lass, Graceless Tom, Mayor of Nottingham, Admiral Curzon, G. F. Wilson, and Rifleman. E. S. Dodwell, Esq., Larkhall Rise, Clapham, was awarded equal first for fine specimens of Unexpected, Clipper, Sarah Payne, Dreadnought, Mrs. Murray, Annhilator, Captain Stoll, Sybil, Admiral Curzon, James Douglas, Squire Trow, Mars, James Merraweather, J. D. Hextall,

Charles Turner, Florence Nightingale, and Crista-galli. Mr. James Douglas, gardener to F. Whitbourne, Esq., Loxford Hall, Ilford, was second with smaller but generally neat blooms, Sarah Payne and Sportsman being particularly good. Mr. H. Hooper, Vine Nursery, Widcombe Hill, Bath, was third with somewhat in-

different blooms. There were four competitors in this class. In Class B, for twelve dissimilar blooms, Mr. E. S. Dodwell was In Class B, for twelve dissimilar blooms, Mr. E. S. Dodwell was placed first with flowers of superb form and substance. The varieties represented were Llewellyn, Robert Lord, George Rudd, Florence Nightingale, Sportsman, James Douglas, John Ball, J. D. Hextall, John Keet, Mars, and James Merryweather. Mr. Douglas was a close second, Squire Meynell and John Keet being very fine. John Hines, Esq., Ipswich, was third; Mr. John Matthews, 489, Wandsworth Road, fourth; George Rudd, Esq., Bradford, Yorkshire, fifth—in this collection, Admiral Curson and Lord Ragian.

Wandsworth Road, fourth; George Rudd, Esq., Bradford, Yorkshire, fifth—in this collection Admiral Curson and Lord Ragian were extremely fine; and Samuel Buttram, Esq., Burgh Mills, Woodbridge, sixth. There were eight entries in this class.

In Class C, for six dissimilar blooms, Arthur Medhurst, Esq., Priory Road, S.W., secured the premier award with excellent examples of James Douglas, Annihilator, Admiral Curzon, Sybil, J. D. Hextall, and Sportsman. W. H. Dodwell, Esq., Sydney Villas, South Lambeth Road, was a good second, Admiral Curzon being fine. Burnaby Atkins, Esq. (gardener Mr. A. Gibson), Halsted Place, Sevenoaks, was third. Those enumerated were the only exhibitors.

stead Place, Sevencaks, was third.

In Class D, for single specimens, a large number of blooms were exhibited. Five prizes were offered in each class. Scarlet Bizarres.—Mr. James Douglas was first with Admiral Curon, good. Mr. E. S. Dodwell second with a seedling; third with the first-named variety; fourth with True Briton; and fifth with Admiral Curzon. Seventeen blooms were shown in this competition. Crimson Bizarres.—Mr. C. Turner was first with J. D. Hextall, very bright and good; and second with a seedling. Mr. J. Douglas was third with a seedling; fourth with Bisteman; and Mr. E. S. Dodwell was fifth with a seedling. Twelve blooms were entered in competition. Pink Bizarres.—Mr. J. Hines was first property. entered in competition. Pink Bizarres.—Mr. J. Hines was first with Sarah Payne. Mr. J. Douglas second with the same variety; with Sarah Payne. Mr. J. Douglas second with the same variety; third and fourth with James Taylor; and fifth with Sarah Payne. Eleven blooms were shown. Purple Flakes.—Mr. C. Turner was placed first with Squire Trow; Mr. E. S. Dodwell second with James Douglas; Mr. J. Douglas third with Squire Meynell, and fourth with Juno; and Mr. E. S. Dodwell followed with True Blue. Eleven exhibits. Scarlet Flakes.—Mr. C. Turner was again in the coveted position with Clipper, a large and bright bloom; also second with the same variety. Mr. J. Douglas was third and fourth with Sportsman, and fifth with John Bagley. Ten blooms shown. Rose Flakes.—Mr. C. Turner held his usual position with Sybill taking the second prize with the same variety and third

shown. Rose Flakes.—Mr. C. Turner held his usual position with Sybil, taking the second prize with the same variety, and third with John Keet. Mr. E. S. Dodwell was fourth, and Mr. Douglas fifth with Sybil. There were twenty-three blooms shown.

PIOOTERS.—In Class E, for twenty-four blooms of twelve dissimilar varieties, Mr. C. Turner obtained the first prize with a collection of superb blooms. The varieties were Her Majesty, Dr. Abercrombie, Emily, Leah, Mrs. Allcroft, Horace Mayor, Empress Eugénie, Lady Baston, Rev. J. B. M. Camm, Baroness Burdett Coutts, Lucy, and Miss Frowd. Mr. E. S. Dodwell was second with neat and clean blooms; Mr. J. Douglas third. Mr. George Rudd was fourth with a good collection, in which J. B. Bryant, the Rev. J. D. Horner, and Morna were fine. Mr. H. Hooper was fifth. Six competitors appeared in this class.

In Class F, for twelve dissimilar varieties, Mr. E. S. Dodwell obtained the premier prize with handsome flowers of Zerlina, Mrs. Allcroft, Alliance, Edith Dombrain, Mrs. Dodwell, John Smith, Ann Lord, Royal Visit, Brunette, and Alice. Mr. J. Douglas was second, Mr. Samuel Buttram third, Mr. John Matthews fourth, Mr. John Hines, Ipswich, fifth; and Mr. H. Cattley, Bath, sixth Seven collections were staged.

In Class G, for six dissimilar varieties, Mr. Arthur Medhurst

In Class G, for six dissimilar varieties, Mr. Arthur Medhurst

In Class G, for six dissimilar varieties, Mr. Arthur Medhurst secured the premier award with fair examples of Miss Wood, Morna, Mrs. Summers, Mrs. Lord, Ann Lord, and John Smith. Mr. W. H. Dodwell was second, and Burnaby Atkins, Esq., third. In Class H, for single specimens—Red, Heavy-edged—Mr. C. Turner was first with Dr. Abercrombie, excellent; Mr. Jno. Hines second with Princess of Wales; Mr. E. S. Dodwell third with John Smith; Mr. J. C. Buttram fourth with Col. Clarke; and Mr. Douglas fifth with John Smith. Seventeen blooms were exhibited. Red, Light-edged.—Mr. J. Douglas was first with Mrs. Bower; Mr. C. Turner second and third with Emily; Mr. J. Douglas fourth with Mrs. Bower, and fifth with Mrs. Williams. Twelve exhibits. Purple, Heavy-edged.—Mr. C. Turner was first with Mrs. A. Chancellor, Mr. J. C. Buttram was second with Norfolk Beauty, Mr. J. Douglas third with Alliance, Mr. E. S. Dodwell fourth with Zerlina, and Mr. Jno. Hines fifth with King of Purples. Eleven exhibits. Purple, Light-edged.—Mr. J. Douglas first with Minnie, Mr. C. Turner second with Her Majesty, Mr. E. S. Dodwell third with Ann Lord, Mr. J. Douglas fourth with same variety, and Mr. C. Turner fifth with Her Majesty. Twelve blooms were shown. Rose or Scarlet, Heavy-edged.—Mr. C. Turner area. Twelve blooms were shown. Rose or Scarlet, Heavy-edged.—Mr. C. Turner was first with Royal Visit, second with Lucy, third with Mrs. Payne; Mr. J. Douglas fourth with Edith Dombrain,

Afth with the same variety. Nineteen blooms were shown. Rose, Light-edged.—Mr. C. Turner was first with Mrs. Allcroft, second with Miss Ward; Mr. J. C. Buttram third with Miriam, Mr. C. Turner fourth with Miss Ward, and Mr. J. Douglas fifth with Escelle. Yellow Grounds.—Mr. C. Turner was first and second with Prince of Orange, Mr. Henry Hooper third with Miss Frampton, Mr. J. Douglas fourth with King of Yellows, and fifth with Prince of Orange.

In Class I, for twenty-four blooms of miscellaneous selfs, fancies, or yellew grounds, Mr. Charles Turner staged a remarkably handsome cellection of blooms, and easily obtained the first prize. The varieties were Heather Bell, A. Alegatiere, Rosa Bonheur, Coronet, Sybil, Unexpected, Mars, Bride, Prince Imperial, Mayor of Nottingham, Peter Stevenson, Admiral Curzon, Eccentric Jack, and Brilliant. Mr. J. Douglas was second, Mr. H. Hooper third, Mr. H. Cattley, Bath, fourth, and Mr. John Matthews fifth. There were six entries.

In Chas K for twelve discipling and interest the control of In Class I, for twenty-four blooms of miscellaneous selfs, fancies.

In Class K, for twelve dissimilar varieties of the above, Mr. E. S. Dodwell was first with good blooms; Mr. Arthur Medhurst second, Master Harry Matthews third, and Mr. John Abercrombie, Chel-

tenham, fourth.

In Class L, for twelve specimens in pots of any Carnation or Picotee, only one exhibitor appeared—Mr. J. Douglas, who was placed first with rose-flake Carnation Rose of Stapleford; Satisfaction, purple flake sport from J. Douglas, James Taylor, Clipper, Fakonbridge, and Illuminator; Carnation Norfolk Beauty, Mr. Nichol, Rival Purple, red-edge Brunette, all well grown and

SLUGS AND SNAILS IN GARDENS.

CAN any of your readers from experience tell me what will destroy snails, slugs, and their eggs? This is the inquiry of "G. O. S." on page 104; and I think the candid reply must be, No one can tell of any specific that will wholly meet the case without being either too expensive, or as injurious to the plants as to the devourers—in common parlance, making the cure as bad as the disease. He has tried paraffin oil and water, McDougall's disinfecting powder, and nitrate of soda, and has used both soot and lime, but mixed with the manure heap, which he suspects has had merely the effect of keeping them warm there during the winter. I have found the most potent means of destroying all kinds of noxious vermin, slugs and snails included, to be constant stirring of the soil; by doing so you throw those that are buried to the surface. They are frequently eaten by birds; and to make certain of this let "G. O. S.," or others similarly annoyed, procure a clutch of young ducklings. Every spadeful of earth turned they will search minutely, and if allowed full liberty they will roam capidly over a whole garden. Expose the soil intended for bedding or other purposes to a few hours' hot sun, and there is scarcely a slug or an egg of one, in the tender stages especially, that will not be effectually killed. If I made an exception of anything it would be of a hard black slug, that for experiment I have often put on a smooth surface and coated over with lime or soot-often effectually.

It must be recollected that all slugs are capable of burrowing into the soil, and through those same safe channels they may be seen emerging after a shower, when the dew begins to fall in the evening, and generally when the soil and surface is in a moist state. Turn up the soil, and you turn up the slugs and snails and effectually close their channels of retreat. Even if they escape the lynx eyes of ducks, birds, or their arch enemy the gardener, they find it difficult to burrow into the earth again before the sun or some other agency has destroyed their soft bodies. Some plants slugs will not touch at all, such as Tropecolums, owing to a hot acid juice they contain; others, as young Petunias, Asters, Godetias, &c., they will certainly devour. When plants become robust they are rarely injured, except Marigolds, which are devoured ravenously at all stages. Lime in dry weather scattered loosely around the base of a plant is an effectual check; repeat it after rain. Carried down by the rain it is both a manure and a deterrent to worms and other injurious agencies. To protect Petunias, &c., in circular awn flower beds, Mr. Lonegan, Birdhill, has adopted with effect the curious expedient of tarring a circular hoop which he has joined on the outside of the bed. The soft tar stops every intending marander. These and similar expedients may be tried by "G. O. S." with benefit to his garden and without great expense.—W. J. M., Clonmel.

"G. O. S." asks about destroying slugs and snails. Let me again strongly advise persons not to tamper with paraffin; acthing is so injurious, as it is perfectly insoluble in water. Several others Carbelic acid is a much safer substitute, and good crystallised for the group.

carbolic acid is quite soluble when melted and used in a weak solution, especially if soft soap is added. The best cure for alugs is quicklime and common salt mixed together and dusted on the ground between the crops. Guano and nitrate of soda are also useful, checking the slugs and invigorating the crops. I have been but very little troubled with slugs, having no Box borders but only tiles. Every inch of ground is forked twice over and left fallow before planting the crops. Nothing so thoroughly destroys slugs as this, but on heavy clay this cannot be done.—C. P. PEACH.

ROYAL HORTICULTURAL SOCIETY.

AUGUST 12TH.

THE principal feature of this meeting was the National Carnation and Picotee Society's Show, which had been postponed to this date from July 22nd; but the miscellaneous collections from nurserymen and amateurs were also numerous and good, and althe section of the meeting proved a highly successful one, for attracted by the fine weather a large company of visitors assembled during the afternoon. The Carnation Show was held in the entrance hall near the Council-room, but any general description or critical remarks would be superfluous on our part, as the observations which are subjoined of the noted cultivator of Carnations Mr.

George Rudd render anything further unnecessary.

FRUIT COMMITTER.—Henry Webb, Esq., in the chair. The duties of the Committee on this occasion were rather light, for very few collections were exhibited. Mr. W. Carmichael, the Gardens, Newton Court, Bury St. Edmunds, sent a large, hand-Gardens, Newton Court, Bury St. Edmunds, sent a large, handsome, yellow-fleshed Melon named Victory of Bristol, very finely
netted and of excellent flavour, for which a first-class certificate
was awarded. Mr. James, gardener to Sir John Walrond, Bart.,
sent two fruits of a seedling Peach of no especial merit. Mr.
Gilbert, the Gardens, Burghley, sent examples of a new Pea, Hobart
Pacha. Messrs. J. Carter and Co. also sent a new Pea, Carters'
Stratsgem; and Mr. Robert Veitch of Exeter exhibited Exeter
Marrow Pea. From the Society's garden at Chiswick came fruits
of Rubus biforus or leucodermis. Messrs. James Carter & Co.
sent samples of Culverwell's Telegraph and Carters' Telephone sent samples of Culverwell's Telegraph and Carters' Telephone Peas, with a request that the Committee have them cooked to decide Messrs. Carters' claim that Telephone is wrinkled and of superior flavour, greater size, and distinct colour. The Committee confirmed the certificate granted to Telephone last year, and con-

frmed also Messrs, Carters' claim.

FLORAL COMMITTEE.—Dr. Denny in the chair. In the Council-

FLORAL COMMITTEE.—Dr. Denny in the chair. In the Councilroom a number of miscellaneous plants were exhibited, Roses, Tuberous Begonias, and Phloxes being especially numerous. Mesers. W. Paul & Son, Waltham Cross, sent nine boxes of cut Roses in excellent condition both in respect of colour, form, and substance. Several varieties were unusually good, such as Alfred Colomb, Exposition de Brie, Pierre Notting, Alfred K. Williams, May Quennell, and Duchess of Bedford. A silver Flora medal was awarded. Mr. Charles Turner of Slough also contributed six boxes of superb Roses, which included fine representative flowers of Alfred Colomb, Louis Van Houtte, Dr. Andry, Sir Garnet Wolseley, Madame Victor Verdier, and Charles Lefebvre. This fine collection received a similar award. Messrs. Osborn & Sons, Fulham, received a vote of thanks for a large group of foliage Fulham, received a vote of thanks for a large group of foliage plants and Ferns very neatly arranged. Messrs. John Laing and Co., Forest Hill, sent a most extensive collection of Tuberous Begonias, the varieties being both numerous and good. The most prominent were Trocadero and Stanstead Rival; the latter, which was awarded a first-class certificate, has extremely large and well-formed flowers, about 4 inches in diameter, and bright salmon scarlet in colour. A silver Flora medal was awarded for the

formed flowers, about 4 inches in diameter, and bright salmon scarlet in colour. A silver Flora medal was awarded for the group of Begonias and a collection of Phloxes in variety. Messrs. Paul & Son, Cheshunt, obtained a silver Banksian medal for a large collection of cut Roses, one box of Mrs. Laxton containing some remarkably fine blooms. Alfred Colomb and Docteur Andry were also well represented.

Messrs. Veitch & Sons exhibited a number of new plants and Orchids of considerable merit. First-class certificates were awarded for the following:—Sarracenia formosa, a hybrid obtained from a cross between B. peittacina and S. variolaris, a pretty and distinct form 6 to 8 inches high, with darkly veined pitchers; Nepenthes Vieillardi, with extremely dark pitchers. A number of fine Iris blooms were also exhibited, of which the following were certificated:—Iris Kæmpferi var. Charles Maries, an enormous flower, white faintly streaked with purple, a yellow blotch at the base of each of the outer perianth divisions; I. Kæmpferi var. The Jersey Belle, neat, pure white, yellow blotched at base of the perianth divisions; I. K. var. Sir Stafford Northcote, fine purple flowers, very large. The Orchids were fine; one specimen of Saccolabium Blumei majus was bearing five long spikes of its delicate purple-tinted fragrant flowers. Zygopetalum Sedeni, a hybrid between Z. maxillare and Z. Mackayi, with dark sepals and petals, and beautiful purplish-blue markings on the labellum. and petals, and beautiful purplish-blue markings on the labellum. Several others were also good, and a vote of thanks was accorded

Messrs. Charles Lee & Son of Hammersmith sent a large and bright group of Tuberous Begonias, principally small plants but well flowered. A bronze Banksian medal was awarded. A vote well flowered. A bronse Banksian medal was awarded. A vote of thanks was accorded to Mr. H. Cannell for a collection of cut blooms of Verbenas and Pelargoniums, and he also obtained a first-class certificate for a handsome Oblens with extremely dark velvety leaves streaked with bright crimson down the centre. Mr. B. S. Williams, Upper Holloway, obtained a finat-class certificate for a new Gladiolus, G. hybridus Lensoinsus, a cross between G. gandavensis and G. purpurso-curatus. The colour is a curious creamy white with a tinge of green, the lower petals being dashed with rich crimson marcon. Messrs. F. & A. Smith of Dulyob received a vete of thanks for a group of Balance and of Dulwich received a vete of thanks for a group of Balsams, and a first-class certificate for a new Fuchsia Eclipse, with fine flowers, scarlet calyx, and rich purple corolla. Mesars, James Carter and Co., Holborn, exhibited a collection of Tropecolums and French Marigolds.

Votes of thanks were accorded to the following exhibitors: Votes of thanks were accorded to the following exhibitors:—G. F. Wilson, Esc., F.B.S., for a plant of Eryngium gigantesum; Mr. J. Tong, gardener to J. S. Sawyer, Esc., for a basket of bedding Begonias; Mr. John Wills, for a handsome specimen of Hydranges panioulata grandiflora. Messrs. Veitch & Sons were also awarded a botanical commendation for a Conondron ramondicides, a pretty little purple-flowered plant. Mr. Boller exhibited a large group of succulent plants, for which a bronze Banksian medal was awarded. An axtensive and graceful group of Gloxinias, Selaginellas, and Adiantums was cent from the Society's gardens at Chiswick.

NETTED VICTORY MELON.

ATTRACTED by the description of this Melon as to flavour and by the certificate that was awarded to the fruit by the Royal Horticultural Society, I obtained some seeds, convinced that any improvement upon Victory of Bath must be a desided acquisition. I did not expect to see much "net" in the new wariety, as I have been operating upon the Victory of Bath Melon for some years to secure, if possible, a handsomely netted form of superior quality; but of the Melons raised the flesh was invariably scarlet when the netting was superior, whilst with moderate netting the flesh was invariably white, coarsely netted and somewhat carbuncled fruits having green

Two plants of Netted Victory were planted, both having dissimilar foliage and fruit. In the young fruit of the two plants the difference is very marked; one is very pale in colour, oval, with a long footstalk, the colour despening as the fruit secones ultimately bluntly oval, very singularly netted at the nose and shank end, the fiesh white, thick, and in every respect first rate. The other plant produces fruit with a short footstalk, round as a cricket ball, only the ends are flattened, coarsely and peculiarly netted, having a tendency to carbuncle, the netting being confined to the st end of the fruit; fisch green, with an exquisite flavour. Netted: Victory shows by its sperting something more influential than a scratched rind, leaving its mark in the progeny. Artificial netting would not affect the seed. Pollen influence has been at work, and though its effect may not be very decided it is nevertheless reproduced by some at least of the progeny. What pollen or male parent Mr. Gilbert may have employed to bring about the variation from Victory of Bath it would be instructive to know. Of its being solely a result of pollen in-fluence, whether designed or accidental, I have not any doubt, it being prone to sport, as crossed Melens invariably are.

To net a Melon is no difficult matter; but to secure a handsomely netted fruit and high flavour is a different affair. Indeed, in crossing Melons we find varieties that are netted the best are not nearly so highly flavoured as others. The most ribbed, carbuncled, or smooth-skinned Melon can be in a single generation changed into a handsomely netted fruit, as I have proved in endeavouring to net Victory of Bath, which is as smooth as any Melon. I have in the first generation obtained a scarlet flesh as closely netted as Read's and as round; an oval fruit also scarlet fleshed, even more closely netted; and a green flesh as round as an Orange, and as coarsely netted as Colston Basset; but not a single variety with a smooth rind. The smooth rind does not appear again until two or more crosses are effected, and then we have it with perhaps a little net at the nose and heel, along with a carbuncle or two. This form, though generally accompanied by a diminution of flesh and colour, is the highest in flavour of all; it may not further be crossed, nor will one plant in three afford the characteristic of the parent. There is no secret in or about such things. Why, therefore, withhold the parentage of high-class Melons?

At the principal agricultural shows pedigree is given for the benefit of breeders of horses, cattle, &c., and in horticulture the parentage of fruits and flowers ought equally to be essentied with merit to the granting of a certificate. - G. ABBEY.

THE LATE HAILSTORM.

I more sensiting will be done in the way of raising a public Provided in aid of some of the sufferers in the Esling. Brentford, Richmond, Bleworth, Kew, and Twickenham de-tricts through the late storm. Mr. Hawkins of Bayswater has tricts through the late storm. Mr. Hawkins of Bayswater has a large glass nursery, and his loss from broken glass and damaged plants is set down at something near £1000; Mr. H. B. Smith, Ealing Dean Nursery; Mr. Lane, The Grove Nursery; Mr. George Weeden, St. John's Nursery; Mcsan, Waylett & Sen; Mr. Smith, Chapal Road Nursery, &c., are heavy sufference. The last four are jobbing gardeners and small florists, employing men for jobbing parposes, and fast their losses keenly. In addition there are many jobbing gardeners who have put up a little glass, and lost plants as well as glass, and these especially need assistance. At Brentford Mr. T. Pestridge of the Boston Park Road Nursery, the well-known grower of variacysted Pelangonums, is a very heavy known grower of variegated Pelargoniums, is a very heavy, loser, and is indeed well nigh ruined. I am doing what I can to awaken some local interest on behalf of these cases, but it is very desirable that a public effort be made as in the case of the hailstorm of 1876, for owing to the adverse character of the season and the slackness of trade many of the small florists are less able to bear their heavy losses. I know of some who would gladly form themselves into a committee to ascertain damages and administer relief were any moneys forthcoming for the purpose. Assistance is urgently needed, and remembering the generous response made in 1876 I trust a similar feeling will be manifested on this occasion.—RICHARD DRAM, Rancingh Road, Raling, W.

NOTES AND GLEANINGS.

AT a General Recting of the BOYAL HORFICULTURAL SOCIETY held yesterday, Dr. Denny in the chair, the following candidates were elected Fallows of the Seciety---via., John Belcher, A. Braid, Alfred A. Healey, and James Whealer.

MAJOR-GENERAL ANDERSON, writing to us on the 3rd instant from Lakefield, Glen Urquhart, on the WEATHER AND VEGETATION, observes:—"Two or three nights back after dull cloudy weather, and following two or three days of bright sunshine, we had frost at night; this was succeeded by drizzling rain all yesterday, and now to-day we have had warm sunshine. These rapid alternations from hot to cold tell upon our outdoor plants, and everything is consequently in a most backward state. Our Roses are only just beginning to bloom. With such weather it is next to hopeless to success? even with common plants."

- DURING the past week the PIONEER AMATEUR FLORAL SOCIETY held their second annual Exhibition in South Bermondsey, which is not exactly the locality one would expect to do much in the way of plant culture, and therefore the results were the more creditable to the exhibitors and surprising to the visitors. The whole of the plants exhibited were grown by working men in the neighbourhood of Bermondsey, and under conditions which were not the best adapted to success. For instance, one who exhibited a collection of miniature succulent plants informed us that they had been growing for some time under his bed, but whether this position was assigned to them as a means of protection during the severe weather of last winter or to stimulate growth during the severe weather of last winter or to stimulate growth we know not. Classes were provided for Fuchsias, Pelargoniums, Stocks, Petunias, Musk, Balsams, Verbenas, Calcelarias, Cacti, and Ferna, and all were well represented, particularly the Pelargoniums, Fuchsias, and Ferna. One enthusiastic exhibitor, Mr. Butler (a lighterman), secured no less than twenty-five first prizes and two second, thus proving the hero of the occasion. The Society is well supported by wealthy and influential patrons, and the attendance at the Show was good, for on the second day upwards of six hundred persons paid for admission. We wish the supporters of this little Society much success in their efforts to promote a love of little Society much success in their efforts to promote a love of horticulture among the masses of the people.

- A COLLECTION of cut flowers of TUBEROUS BEGONIAS was recently submitted to our inspection by Messrs. Sutton-and Sons of Reading, selected from a batch of seedlings raised by them. The form, size, substance, and colours of the flowers

were extremely good, and several of the varieties could scarcely be surpassed for beauty and vigour. The crimson and scarlet flowers were especially noticeable for their great size; the other well represented shades of colour were pink, creanywhite, and yellow. The strain is an excellent one, and now that Messrs. Sutton have given their attention to these popular plants still further improvement is certain to follow.

— THE general condition of SOUTHWARK PARK is at the present time highly creditable to the management, and as a place for healthful regreation in a densely populated neighbourhood too much can scarcely be said in its favour. There is a nestness and cleanliness in the appearance of the turi, shunbleries, and the asphalte walks which would bear comparison with far more presentions public parks and gardens.

the peculiar ROSE VERTE, or Green Rose, is now in flower, if such bunches of green leaves deserve the name of flowers. The origin of this plant seems involved in obscurity, for while some consider it as having first appeared on the continent, others state that it was sent from America, while others again attribute its origin to a small nursery in England. The name it bears at Kew is Ross sempervirous memerics, and, as most of our readers are aware, its singularity is due to the conversion of petals, stamens, and carpels into small green leaves.

GARBRAND HALL, EWELL, the residence of Mrs. Torr, is famed for the excellent plants, especially Azaleas, which Mr. Child grows so well and exhibits so successfully. But there is much to admire in Mrs. Torr's garden besides the specimen plants. The grounds, which are about 13 acres in extent, are enclosed by a lofty and substantial wall. This comparatively small enclosure has been made the most of by judicious arrangement. Banks have been raised, and curving walks formed in such a manner that the real extent of the grounds has been masked in a very successful manner. Shrubs, Conifers, and ornamental trees have been planted in profusion. Some of the finest variegated Acers we have seen are there, also mop-headed Acacias, Robinia inermis. At the front of the mansion a beautifal miniature lake has been formed, the water being clear as crystal, so that the grand Lombardy Poplars, Willows, &c., growing near the margin are reflected with remarkable effect in the pure spring stream. A noble Tulip Tree near is flowering profusely. In one place is a flower garden, in another a rosery with rocks and herbaceous borders in suttable positions, the whole garden forming a charming secluded retreat randered additionally enjoyable by the excellent manner in which the grounds are kept by the gardener.

— Mes. Torre's exhibition plants are not grown in low yet roomy span-roofed houses which one might expect to find, but in a long lofty range of lean-to's beving a southern aspect. There the splendid Azaleas are arranged, some being elevated on large pots, others on tailer drain pipes and large chimney pots, so that the plants are as near the glass as possible. The plants are not placed out of doors at any time, and they evidently receive the best attention, as is indicated by their clean-liness and free growth. Other greenhouse plants are in the same excellent condition, as also are the stove plants that are grown in the same range. Orchids are not so numerous as formerly, but the stock is a choice healthy one if small. Several houses are devoted to Grape culture, and useful crops are produced—quality of fruit rather than large-sized bunches being the object aimed at. In the conservatory are Dicksonias with trunks of unusual size, and in a case very fine examples of Todes superba with various flowering plants on the side stages clean and well cultivated.

In the KITCHEN GARDEN, which contains many fruit trees and good vegetable crops, the most striking and singular feature is the boundary wall, which represents a segment of a circle. For a considerable length the wall faces south or nearly so, and on this aspect every Peach tree has been killed by the late severe winter and inclement spring; but where the wall curves, presenting a south-eastern aspect, every tree is healthy. The trees on the southern portion of the wall grew and formed fruit, then the whole of them died suddenly, not a vestige being left. Mr. Child does not again intend planting Peaches there, and, indeed, it is little use doing so unless the trees can be covered with glass. The wall and aspect are suitable for disgonal cordon Pears, and it is questionable if any other trees could be planted more usefully and ornamentally.

— THAT charming ministure Spruce Fir ABIES EXCELSA GREGORYANA seems to do well on a rockery judging by its

appearance at Chiswick, although it is also adapted for other situations. The plant is extremely dwarf, almost rivalling A. pygmæa. The specimen referred to is not more than a foot in height, and about 2½ feet across the recumbent branches. The needle-shaped leaves are stiff and short, and are thickly placed on the branches. This variety was raised at the nursery, Circumester, Gloucestershire.

THE VAN HOUTTE MONUMENT.—We are informed that the unveiling of the monument of the late Louis Van Houtte will take place at Gendbrugge, Ghent, on Sunday the 17th inst. Delegates from botanical and horticultural societies will be received at 3 P.M. on the day mentioned in the Place Comte de Flandre, opposite the railway station. A banquet will be held on the evening of the same day at the Hôtel Royal, Place d'Armes. Those who intend to take part in the ceremonies should communicate with M. Ed. Pynaert, 142, Rue de Bruxelles, Gand.

Barkson at the LIVERPOOL SHOW, for an extensive and superior display of wirework, a similar award was granted to the same exhibitor for the Allerton Priory Botler, a powerful apparatus that is highly spoken of by practical gardeners in the district. No awards were made to implements when we left the Exhibition, and the list of medals, &c., granted in that section of the Show was transmitted to us by telegraph. Mr. John Richardson of Beston informs us that he was awarded first prizes in the open class for twelve dishes of vegetables and four dishes of Peas at the same Show.

—— An extremely handsome stove climber is IPOMGMA PANICULATA especially during the summer months, as it then bears a profusion of large orimson purple flowers in a somewhat paniculate inflorescence, from which character the specific name is derived. The plant requires a rather high and moist temperature, and a house devoted to tropical aquatics is excellently adapted to its requirements. There is a good instance of this at Kew, where the plant is growing luxuriantly in the old Lily house.

We recently noticed several extremely fine OBCHIDS flowering in the house devoted to these lovely plants at Kew, and especially remarkable was the handsome Dendrohium McCarthise. This is an epiphytal species, a native of Ceylon, and it was introduced about 1854. The delicately purple-timed flowers are borne in graceful pendant spikes; and when, as in this case, the plant is growing on a block suspended near the roof of the house, it appears very beautiful, and also thrives admirably, for a light position is requisite to its successful cultivation. That magnificent terrestrial Orchid Disa grandiflors was bearing numerous flowers of the bright scarlet-crimson hase which characterises it as one of the finest of the genus. Lyanste Deppai had several flowers of a greenish yellow colour clouded with brown; petals white; labellum yellow with chocolate spots. This old Orchid is rather attractive. A plant of Stanhopea Wardii was suspended in a basket, through the bottom of which it had ferced a fine spike of its curiously spotted flowers.

ON CIRCUIT. HMLENSBURGH ROSE SHOW.

My visit to Helensburgh this year was made under mingled feelings of pleasure and sorrow, and I was painfully reminded of my first visit four years ago when I was so heartily welcomed and so hospitably treated. The welcome was as hearty now and the hospitality as great, but those who first extended them to me are alas! no more amongst us. I shall never forget the kindness of the two gentlemen who then out of sheer love to the Bose welcomed a stranger amongst them. The pains they took to make my visit a pleasant one left a deep and lasting impression on me, and I should be ungrateful indeed not to remember it. One of them, the indefatigable Secretary and virtual founder of the West of Seotland Rosarians' Society, was most feelingly alluded to by several gentlemen who took part in the proceedings of the Exhibition this year, of which I must now give some account.

The Exhibition was held, as last year, in the Skating Rink, or

The Exhibition was held, as last year, in the Skating Rink, or rather what was the Skating Rink, for happily here as everywhere that American institution has not taken root amongst us; and notwithstanding the unfavourable nature of the season the number of the Rosee exhibited was greater than that of last year, although no competitors from England entered the list, while the quality was certainly as good. As I have before explained the Exhibition here is peculiar. The stands are all furnished by the Society. "Stands" is, however, rather inapplicable to them, as they are simple tables covered with moss with tubes inserted in

them, so that each exhibitor has a place allotted to him. He takes the Roses out of his own boxes and places them on the tables. Thus all are on the same level, all are upon the same footing, and so far it is an advantage. Moreover, as one of the exhibitors said, "I am not troubled about my boxes. I can take them away when I choose, need not wait until the close of the Exhibition, and am thus independent." At the same time the plan has its inconveniences. Those who are in the habit of arranging their boxes previously to starting from home do not like it, and in the taking of the blooms from the box to put on the tables confusion often

veniences. Those who are in the habit of arranging their boxes previously to starting from home do not like it, and in the taking of the blooms from the box to put on the tables confusion often occurs and names get wrongly placed or lost.

Amongst nurserymen the chief prizes fell to Messrs. Dickson of Newtonards, who exhibited some fine stands, although not equal, I think, to those shown at Newton Stewart. Amongst them were some fine blooms of La France, Baronne de Bothschild, Karl of Beaconsfield, Marie Baumann, Marguerite de St. Amand, Dr. Andry, Alfred Colomb, Duke of Edinburgh, Marquise de Cassellane, and other well-known varieties. The second prize was awarded to a local nurseryman, but was withheld owing to some of his flowers being unnamed. This is a rule which I think ought to be more rigidly adopted in the south than it is. It gives a loophole to a dishonest exhibitor (and there are such) who knows that he has unfortunately duplicates in his stand and yet is unwilling to give one of them a different name, and so leaves it alone, whereas if it were named the fraud might be detected; and there are some Roses which, although generally detected, yet in certain seasons come so near to one another that it is very difficult to detect them. The third place was occupied by Mr. Smith of Stranraer with some fine blooms. According to our sonthern rules he would have taken second place when the second stand was disqualified; but it was not so arranged here. Amongst amateus the chief place was undoubtedly held by Major Dennistown of Roselea, whose blooms were fresh, of good size, and exhibited proofs in their foliage of fine cultivation. His stands contained the usual well-known show varieties, and his stand of twelve blooms of La France contained large and beautifully fresh blooms. I desire particularly to notice it, because I had the opportunity of seeing his garden where Roses, few in number indeed compared to many, but of excellent growth and vigour, were evidently as home; and amongst them I saw the very finest

At Helensburgh, as in most places, the rule has been adopted that no foliage should be added. I noticed on going round on my duties that one box looked very suspicious, the foliage was so ample and so neatly surrounded the bloom. Well, I took out one bloom, cut the bass, and found a very clever evasion of the rule. No foliage was added, but the bloom stem was cut about a foot long; some 8 or 4 inches under the flower there was some good foliage, the stem was doubled up, and this foliage was brought up under the bloom. It was "unco canny." Nothing was added, and the bloom was in one sense shown as cut from the plant. But ought this to be allowed?

There was nothing remarkable in the class for new Roses (the prizes in this class being offered by Mr. Cranston); indeed, owing to old Roses being put in and the general inferiority of the blooms, no prizes were awarded. It was evident that although the Committee had lost the services of their indefatigable Secretary Mr. Galloway, yet there were others who were determined to make the Society a success; and with the kind and genial Provost Stuart as their President, I have no doubt the West of Scotland Rosarians' Society will tide through this disastrous year and have a prosperous course before it. The second prize for twelve Teas was awarded to Mr. James Service of Maxwelltown, at the Newton Stewart Show, and not to Mr. Smith as stated last week.

LERK.

"Its a lang way tae Cupar," and so it is a good stretch and a tedious journey to Leek in Staffordshire, where I was to be on Tuesday, and so after a quiet day spent on Sunday at Helensburgh with my good friend Provost Stuart, I started off on Monday morning at eight, not reaching Leek until eight or nine in the evening. It was, of course, fine travelling on the Midland from Glasgow (by-the-by, let me recommend anyone who has to stay in Glasgow to try the new hotel at St. Enoch station) to Crew; but then commenced the delay; an hour to wait there and two at Stoke showed that the arrangements of the North Staffordshire railway are not quite of the first order, but at last I arrived, and was hospitably received and welcomed. I had thought Leek was a small place, but I found, on the contrary, that it was a busy manufacturing town, celebrated for its sewing silk, which is sent to all parts of the world. There is a very earnest band of Rose-growers who have started a very good club, and its exhibition of two years ago was duly noticed in the Journal. This year they were singularly unfortunate. The Show had been

twice postponed, but although the fixture was a fortnight later than originally intended it was still too early. Leek is a very cold place, and consequently beckward, and in no place that I have seen this year has everything (including Roses) given such evidence of the very abnormal season through which we have passed. Strawberries on July 29th were hardly in, and it will be seen how difficult it must have been to have exhibited Roses, especially as it is confined to amateurs. Measure. Avail, Cartwright, and others did their very best; but in many of the standa no expanded buds were put in, in order to make up the number. The most noticeable Rose I saw was a Tea in Mr. Newall's stand called Madame Maurice Kuppenheim. It has very large shell-like petals of a peculiar colour, although I am afraid there is not enough of them; it is, however, worth a trial. Messrs. James Dickson & Co. of Chester showed, not for competition, a very good stand. While the stove and greenhouse plants from Mr. Gloxea's gardens exhibited evidence of very successful cultivation. There is a curious custom adopted here and at Newcastle previous to the show—a person accredited by the Society goes round and visits the gardens of the intending exhibitors in order to see what they are likely to exhibit, so that no deception may be practised. As it is a club with a few members this can be done, but I think, after all, it would be better to trust to the good feeling of the members. I have nowhere seen greater enthusiasm in the cause of the Rose than here. The times have been against them this season, but I do not think the men of Leek will be discouraged, but rather stirred up to increased earnestness, and with an energetic committee and efficient officers such as they have I am sure they will succeed.—D., Deal.

FORCING STRAWBERRIES IN POTS.—Your correspondent Mr. W. Bardney states on page 1, that I "appear to cling to the old system of forcing Strawberries." Now I can assure him I am only too pleased to hear of any improvement, but as the system of layering Strawberry runners in their fruiting pots has been practised for more than thirty years there is nothing new about it. I think the method of growing Strawberries for forcing I have described in the Journal of Horticulture is of a more recent date than the other. The Strawberry being of strong growth and subject to the red spider, is one reason for placing saucers under the pots, not only to contain a supply of moisture, but as a preventive against dripping on other plants which may be placed beneath. In winter the plants are placed in shallow cool frames on ashes with tar felting on framework in place of lights, merely for protection in bad weather. Surely a few frames are easily made like the above. I prefer this to the old plan of stacking the plants, &c. By this treatment I have been amply repaid with well-flavoured and large fruit.—H. C. OGLE, Turnworth.

CLETHRA ARBOREA.

CLETHRA is an Ericaceous genus which comprises as at present known about eight species, five of which are natives of North America, one is found in Peru, another in Jamaica, and the one under consideration is confined to the island of Madeira. All the species are shrubs, and there is an interesting fact in connection with their geographical distribution which is deserving of notice. The hardy species—viz., those from North America, are deciduous, whereas the others, which require the protection of a greenhouse, are evergreens. In the latter section is included the old but remarkably handsome C. arbores, a spray of which, obtained from a fine plant in the Royal Horticultural Society's Garden at Chiswick, is represented in the annexed engraving (fig. 18).

the annexed engraving (fig. 18).

This species, which undoubtedly far surpasses the others as a decorative plant, was introduced to the Royal Gardens, Kew, in 1784 by Mr. Frederick Masson. It has bright green elliptical leaves, and bears numerous terminal compound racemes of pure white, bell-shaped, fragrant flowers. The shrub attains the height of 8 or 9 feet, and succeeds admirably in a pot, the soil consisting of sandy loam. It would, no doubt, also grow outside if planted in a sheltered position in the southern counties of England, but we are not aware that the experiment has been tried. The slightly pendulous thickly placed flowers are highly suggestive of Lilies of the Valley, and are admirably adapted for cutting purposes, as they keep for a considerable time after being separated from the plant. Although not absolutely neglected, yet this plant is by no means so extensively grown as its merits demand, as a more beautiful shrub for flowering during July and August in a conservatory or greenhouse could scarcely be found. The flowers and buds are admirably delineated in the engraving, but our artist has

Fig. 16.—CLETHRA ARBOREA.

BANK HOLIDAY AT CHESHUNT.

"IT's an ill wind that blows nobody any good," and the cold and wet that has prevailed for the whole of the first six months of the year, killing our tender Rose trees, withering-up the foliage, and retarding and knocking to pieces our blooms, has at last provided me with the above-named treat. It is day's enjoyment that I had long promised myself; but July, when the Roses are generally in full bloom, is such a very busy month with me that I have been unable to spare a day, and the first Monday in August has found the Roses nearly all over; but this year they have been so retarded that they are only now to be seen in their beauty. On arriving at the nurseries I was welcomed by Mr. Paul, and by him passed on to his energetic and obliging Rose foreman Gater; and with the soil and situation so good, and with a foreman so intelligent and painstaking, and with such a love for his work, it is no longer a wonder to me how Mr. Paul is able to take such a high position as a Rose exhibitor.

Our first point was a fine batch of the newly introduced Roses, among which Alfred K. Williams stands pre-eminent. It is a good grower, with large bright red flowers of good sub-stance and fine shape, something like Horace Vernet, but a more vigorous grower. It appeared to me to be the best Rose of its year, an opinion in which I was glad to find both Mr. Paul and his foreman concurred. The next in order of merit appeared to be Madame Gabriel Luizet, a large finely-shaped Rose, between Abel Grand and La France in colour, but stiffer petalled. Constantine Fretiakoff seems to possess all the good qualities of Comtesse d'Oxford, but is somewhat lighter in colour and a stronger grower. Madame Marie Verdier I was much pleased with; it is of a pure rose colour with very fine petals. Boieldieu, Charles Baltet, Edouard Pynaert, Princess Charlotte de Tremouille, Madame Laboulaye, and Edouard Dufour seem likely to turn out well, but will require further proving. Mabel Morrison is a healthy free-growing Rose of a beautiful pure white colour, but too thin for exhibition purposes. Souvenir d'Auguste Rivière is a splendid dark Rose but flat, while Mr. Turner's two Roses Penelope Mayo and Dean of Windsor are both grand; the former rosy carmine in colour and of beautiful pointed shape, the latter of a darker colour and similar in shape to Oxonian. Mr. William Paul's May Quennell is a fine globular exhibition Rose, bright centred

with darker shading, and of vigorous hardy growth.

We next turned to Mr. Paul's own Roses, and I was glad to find that they almost all have fine high centres instead of being that and thin as too many of the French Roses are, and that they are, so far as proved, good autumnal bloomers worthy of the name of Perpetuals. Of those already sant out Mrs. Laxton is decidedly the queen—beautiful in colour, of the very finest globular shape, and of exquisite fragmence. Another good quality is its perfect uniformity of character. After seeing it in one part of the nursery I had no difficulty in recognising it wherever met with; altogether a magnificent Rose. John Bright, too, I was especially pleased with. When this Rose obtained the prize as the best seedling at the Crystal Palace I thought it much too thin to be of any use except in the garden; but it now seems to have improved in this respect, and to have main-tained its character as the very brightest crimson ever sent out. Marchiness of Exeter appears to be a fine Rose, but as it is an early bloomer I was unable to see really characteristic flowers. Emily Laxton is doubtlessly good, but I think those who already grow her sister Annie Laxton will scarcely need her. Robert Marnock and Charles Darwin are two fine brownish crimson Roses, both very free autumnals, the latter with a decided dash of Bourbon blood; and Marquis of Salisbury, one of those only just sent out, is a strong compact-growing plant with fine dark rose-coloured flowers of globular form. The wet of this year had been rather more than it appeared to like, but in ordinary seasons I should expect it to be a splendid

Three new Roses to be sent out next year are Duke of Teck. Climbing Glory of Cheshunt, and Earl of Beaconsfield. Of these the first has already been described more than once in your columns. It is of strong-growing habit, free-flowering, and bright scarlet in colour. Perhaps it is a trifle undersized, but it has already won prizes and certificates wherever exhibited. The second of the trio is a rapid yet strong-growing plant, with fine foliage and flowers similar in colour, and many

failed to pourtray the elegant and pendulous character of the sa large as Reynolds Hole, so that it will rank at once both as racemes. is a grand Rose as regards growth, foliage, and flower, and will go far towards immortalising the name of Captain Christy by whom it was raised. Of other seedlings of which the stock is to be greatly increased ready for sending out later on it is parhaps premature to say much, but I must refer to one which is dedicated to, and bears the name of, our amateur champion Mr. B. N. G. Baker. It will be enough to say that it appears to be a fitting companion for the splendid Rose sent out by Mr. Turner; or to quote Gater's words, "Mr. Baker likes it very much, and for him to like a Rose it must be a good one

you know, sir."

From the seedlings we went to the Tea Rose garden, which is laid out in beds 8 feet wide. Down the centre of each bed there rans a light yet strong wire, to which are trained the strong-growing hardy Teas Gloire de Dijon, Belle de Bordeaux, &c. Next to these on each side is a row or two of standard Teas, the beds being finished off with a row of dwarfs next the walks. The whole is surrounded by a good hedge or fence, and the Roses are further sheltered by rows of trained fruit trees being interspersed here and there. The result of this careful yet very simple arrangement is that the Roses are quite safe from frost, and even with the bitter weather of last winter I was told their losses were extremely few, in fact scarcely any. Here were all our old favourites in large numbers and great beauty. Catherine Mermet, Alba Rosea, Cheshunt Hybrid, Niphetos, Souvenirs d'Elise and d'un Ami, and Devoniensis in such splendour as to make even Gater, who sees so many fine blooms, pause and exclaim as he lifted a lovely drooping specimen, "When are we going to beat this, sir?" Good new Teas are very rare, but I liked the look of Madame Nabonnand, a good-sized flower, something like Devoniensis, but with a pale pink centre; Madame Lambard, bright rose colour, in the vay of President but larger and better shape; and Madame Welch, light yellow with darker centre.

Our next move was along the New River bank to a splendid lot of the older varieties—twelve acres of dwarfs and standards in full bloom, presenting a grand sight. There the visitor can see the same Roses on all stocks—standards, seedling Briar, Briar cutting, De la Grifferaie, and Manetti, and thus can order his plants on whichever seems to him to suit the variety best. The whole of the varieties were looking remarkably well; the general damp and gloom of the season had of course suited the dark Roses best, but there had been three or four hot days which had brought out the lighter ones in fine style. Reynolds Hole, Xavier Olibo, Sultan of Zanzibar, Prince Camille de Rohan, and Duke of Connaught among the darks; and Baronne de Rothschild, Marguerite de St. Amand, Marie Finger, and La France among the lights were splendid; but perhaps finest of all was Capitaine Christy. While we were admiring, Mr. Paul joined us with a fine bouquet in his hand consisting of a fine bloom of Mrs. Baker surrounded with three of Capitaine Christy, and he remarked, "It is not often I cut a Rose, but Capitaine Christy is so beautifully fresh this morning that 1 was tempted. I think that," pointing to one of the three, "is the finest bloom of it I have ever seen." I had an opportunity here of seeing a quantity of Eugène Verdier and Marie Finger growing side by side and comparing them; having done so, I am bound to say I think there is a decided difference between them. Marie Pinger has darker wood, and the flower is darker in the centre, and again this variety has several large spines on each shoot, while Eugène Versier has apparently none at all. Of course they are very similar and both would not be required in a small collection, but I do not think I go too far in saying they are nearly as dissimilar as Baronne de Rothschild and Capitaine Christy.

I was next conducted through ten large houses, in one of which the giants in pots, some of them sixteen or eighteen which the grants in pots, some or them sixteen or eighteen years old, which take honours year after year at the early shows in March and April, were quietly reposing, looking splendidly healthy. Another had a splendid Marchal Niel trained all over the roof, while the bottom part was crowded with smaller plants of the same variety in pots, and the rest were filled with fine young plants of all the best sorts for this mode of culture. Then through the Rose garden formed of lants in pots laid out in about a dozen hede each plunged plants in pots, laid out in about a dozen beds, each being filled with a light variety and edged with a dark one; Duchesse de Vallombrosa surrounded by Reynolds Hole and so on, and the whole enclosed by fine pillar Roses. Then through a Rhododendron garden, at the end of which is a Wellingtonia, declared by Mr. Harry Veitch of Chelsea to

be perhaps the finest specimen to be seen in England. Then past hundreds of pots containing plants of the newer or finer varieties, at present only tiny shoots a few inches high, but

which being plunged in cocon-nut fibre on hotbeds, grow in a few mentles into fine bushy specimens.

And then F had not seen all. I was told of several screw of Roses, mostly five-chase Tess, at Highbouch, and of seven other houses which I had not visited. The fruit trees I had not been near, and the Strawberry ground I had seen nothing of ; but I had seen enough, heard enough, learned enough, and brought away with me a fine bunch of Roses enough to make Bank Holiday at Cheehunt one of the pleasantest days ever spent by A LOVER OF BOSE SHOWS.

MARILDSLIE CASTLE

MAULDRAIN had a history eight hundred years ago, and eriginally comprohended nearly the whole parish of Carlolle, same six miles in dissector, and in the times of John Bullet and Bobart the Bruce had been a royal forest, which was gradually broken up by the latter, and like other extensive tracts in Sectland given to persons of distinction, in order doubtless to secure and maintain men skilled in the art of war at a time when Scotland stood in great need of them. The present castle, a noble pile of baildings, was built and finished in 1792-3.

The walls are of stane from a country of the present castle, The walls are of stone from a quarry on the estate not far from the spot on which it stands. This stone, a cream-coloured tre, scenar to dely weather, for the castle looks as clean and

ne, seems to dely weather, nor use when it did sixty years age.

B. stands on part of the estate which is unentailed, and this stands on part of the estate which is unentailed, and this part is remarkable for its charming though circumscribed mery. The situation is about midway between Lanark and Hamilton on the north side of the river Clyde, and the castle is slightly raised above and overlooking the clear waters of this river, which heads round the pleasure grounds and tends westwards. The place is heavily weeded, and the trees near the house are very noticeable for their height, brandth, and symmetry; and most of them, like the houses in the City of Edizburgh, give one the idea that they are there for effect, standing just where they ought to be, and form past of a complete and finished picture. It is a pleasant spot well sheltered by rising lands all round, which are well covered with forest trees and orchards.

On this part of the Clyde the orchards are noticeable. The odd corners and sloping banks everywhere are planted with fruit trees. "The banks and brace," etherwise unclose and unworkable, are converted into inuitful and profitable rdens. At Manidelie there are nine serve of such ereb The Gooseberries alone of these evenants sold one year for \$280. I do not know what they were sold for this year; but the Gooseberries at Brownise, adjoining Maudalie, have realised £320 this season. The Gooseberries and Plums I have been told "pay better than Apples and Pears.

The unentailed part of Mauldelie has changed hands several times. In 1850 it was in the market, and was then purchased by the late James Hesier, Esq., and is now in personaion of his eldest son. Since it fall into the possession of the Hesier family everything about the place has been better kept. A substantial and beautiful bridge has been built screen the Clyde, and an ornamental lodge for the bridge-keeper exected flare; a new farm steading has also been erected, the kome farm put into good trim and high culture, and the approaches

to the house have a clean and neat appearance.

The gardens are of moderate size—about five acres of flower garden and three acres of kitchen garden. The flower garden is en the south side of the eastle, in front of some of the principal tooms. The kitchen garden is some distance from the house, and is quite hidden from it by trees and shrubs. Two scree of the kitchen garden are walled in, and one acre lies between the south wall and the river. In the walled garden there is a good dwelling house for the head gardener (Mr. Gorrie) and a good bothy for five of his men. Evidently Mr. Hozier is wishful to provide for the comfort of his servants. The hothouses are all in the kitchen garden and are of moderate dimensions. The three vineries are about 36 seek longeach. The early house is filled with Black Hamburghs, the second one with Mussats, and the late one with Kady Downes' Seedling, all bearing fairly good crops of ordinary sized bunches with large bearies. Peach trees were in full fruit. The Fig trees in smother house are exceedingly healthy and fruitful. In two Melon pits were plants grown on wires loaded with fruit of a small kind of Melon. For the culture of plants and flowers

there are what is called a span-roofed stove, a span-roofed greenhouse, a Camellia and Fern house, &c., all of which we found filled with plants in full growth. A new fruit room, 24 feet by 12, was built last year. Above the fruit room there is sanother room the same size for keeping Grapes in bottles during the windowand spring months. This room is lathed and plastered, and is covered with both roofing felt and slates; is has a fireplace, and is shelved for holding 170 bottles in a slanting position. Mr. Gussie told me he placed 170 busness of Lady Downes' Grapes in these bottles on the 7th of January this year, which lasted the family until the 14th of June, and some of the bunches were good and plump to the last.

At Mauldelie there is much to admire, and little, if anything, at manuscus; there is much to saming, and little, if anything, to find fault with. In the kitchen garden there are two plain borders (without reckery stones) planted with hardy Ferns in great variety, each plant standing separate were, to my eye, models of nevelty and good taste. The three terraces on the south front of the castle which make the flower garden might perhaps be altered with advantage at little cost. If the highest were lowered or removed the castle would appear more elevated, and the flower garden would have a botter annearance and be and the flower garden would have a better appearance and be

better seen from the windows .- A. PEDTIGREW.

SOUTHPORT HORTICULTURAL SHOW.

AUGUST STE AND STH.

ARGUST STR. AND STR.

THE above Show took place on Friday last at Southport in the large conservatory of the Winter Gardens. We were semewhat surprised to hear the Show last year with its £400 in prizes was not well petrenised, and are inclined to think with the Superisements of the above gardens, Mr. A. Campbell, that if good local prizes were offered by the inhabitants of this fine watering place that greater intense water would be arrised, in the above. We do not prises were offered by the inhabitants of this fine watering place that greater interest would be evined in the shows. We do not see why Southport should not have shows such as these of Leeds, York, Newcastle, Liverpeel, and other large provincial towns. The conservatory of the gendens is a fine place for a spring and astume show, but it is decidedly objectionable en a hot summer's day to ladice and gentlemen. The first named in particular de not admire being broiled in a large glass house, and will not go to such places to view Nature and Ast. On the other hand, when ambibitions are held either in a field or park under canvas, the timis are found to be a cool and pleasant retreat on a hot day; the flowers in a cut state also lest a much lenger time in good condition then under class. dition than under gla

dition than under glass.

The classes of this Show were fairly well filled, and the preductions were generally good. In a few cases, however, the Judges withheld the awards, the exhibits not being of sufficient merit. The plants were instefully arranged in circular groupe down the centre of the large building. These were four entries in the class for missellaneous plants arranged for effect, entries in the class for missellaneous plants arranged for effect, good plants were exhibited in the various classes, and the Exhibition was estistically amonged. Furns were not shown in large quantities, but the plants were good. Furthelias were in better condition than any we have seen this year, the plants were fine, well bloomed, and finely developed; dask varieties greatly predominated. Colourses were also shown in fair condition, Gloxizias were good, and Zonal Pelargeniums were very fair.

Miscellaneous collections of plants were staged, not for competition. Misses, G. & W. Nazes, nursesymen, Meaton Nontis, Misses, that an assertment which included some well-grown and choice plants suitable for decorative nursease, also a box of

Missichester, had an assertment which included some well-grown and choice plants suitable for decorative purposes, also a box of thirty-siz Bose bads. Mr. J. Shaw, F.B.R.S., of Bowden, staged a very fine collection of Resinespense in pots, also Caladiums, Aloussian, and Decorate new and old, with many other choice stove plants.

Rose were admirably shown (not fer competition) by Mesure.
Crosseon & Co., Hereford, Mesure. James Dickson & Sons, Chester,
and Mesure. Dickson & Robinson, Manchester. The first named
collection arrived late at the Show through some delay on the
line, and for size, colour, and solidity the blooms far surpassed

In the centre of the building a large table was tastefully laid out with dinner-table descritions by Mrs. Cassons, Birkdale, Southpart (not for competition). The arrangement was light and elegant. The object of the exhibitor was to interest other ladies of Southpart and district in table descritions, and we undescribe the second of the exhibitor was to interest other ladies of Southpart and district in table descritions, and we undescribe the ladies of the exhibitor was to interest other ladies of Southpart and district in table descritions, and we undescribe the exhibitor was to interest other ladies of the exhibitor was the exhibitor was the exhibitor was and she purposes offening a prise next year for the best arranged ible. We think she ought to be highly commended for the

praiseworthy step she has taken.

praiseworthy step she has taken.

The fruit was small in quantity, of a very ordinary kind, and consequently needs no special notice. The schedule contained twenty-five classes for cottagers, and the competition was good. It certainly would be beneficial for the country at large if more prizes were effered for cottagers, as they would thereby be induced to take a much greater interest in their gardens, from the cultivation of which they might derive many hours of pleasure.

The principal prisetakers in the various classes were lift. Corcoran, gardener to G. Chamberlain, Esq., Birkdale; Mr.

Rockliffe, gardener to T. Powell, Esq., Southport; Mr. Holder, gardener to W. Bellhouse, Esq., Southport; Mr. Swire; Mr. Heaton, gardener to Mrs. Bradbury; Mr. Ferguson, gardener to W. Kellett, Esq.; Mr. Shaw, gardener to Mrs. Winder, Walton; Mr. Sutton and Messrs, J. C. and T. F. Knowlson.

The Judges were Mr. John Shaw, Bowden; Mr. Upjohn, Worsley, Manchester; and Mr. Mackellar, Abney Hall, Manchester

NOTES ON VILLA AND SUBURBAN GARDENING.

FLOWER GARDEN.-In ordinary seasons we should now commence to propagate Tricolor, Bronze, and Zonal Pelargoniums for next year, but at present there is a great difficulty in finding cuttings sufficient for this purpose. Owing to the dull and wet cuttings sufficient for this purpose. Owing to the dull and wet summer the plants have not grown with their usual rapidity, and to cut away the little growth they have made is to destroy the ornamental effect they may be able to produce during the remainder of this month. Fortunate are the gardeners who possess a reserve stock of plants to cut from. Those that have not would do well to delay the operation of propagation for a short time longer. Continue to remove dead flowers and leaves from plants in bell. in beds. Keep the edges cut closely and the beds free from weeds, nn bees. Keep the edges cut closely and the beds free from weeds, so that a neat appearance of the garden may in a measure compensate for the deficiency of growth and flowers. Mixed borders are now very pretty. Sweet Williams have been bright for a long time, and are still very gay. The best varieties should be selected and marked for seed. Regulate the growths of the stronger-growing annuals, and remove all old flower stems where seed is not

RITOHEN GARDEN.—The condition of the Potato crop is now a matter of the greatest importance. The disease is spreading so rapidly that in many places around London it threatens to destroy rapidly that in many places around London it threatens to destroy the greater proportion of the early varieties. We strongly urge the advisability of lifting all except the late varieties, and removing them to a place where they can be laid out thinly. The ground which becomes vacant by the removal of the Potatoes should be planted with Cabbage, Kale, and other winter greens. Clear the ground of Pea haulm as soon as the Peas are gathered. The sticks should be tied in bundles and stowed away, and the ground

sticks should be tied in bundles and stowed away, and the ground may be dug and planted again with winter vegetables at once.

Celery may yet be planted for late supplies in trenches about a foot wide, but not quite so deep now as earlier in the season. Place a good coating of well-decayed manure over the bottom of the trench; in this the young plants will grow vigorously.

Cawliftowers.—A sowing of these may be made this week, and a second sowing towards the end of the month. It has been our

practice for some years to sow about the 21st, but the seed should

practice for some years to sow about the 21st, but the seed should be sown a few days earlier in the north of England and a few days later in the south. Sow the seed on a light warm border, and if the weather should prove dry water must be given. Early London and Walcheren are the best varieties for the present sowing.

Cabbage seed not sown the last week in July must be sown without further delay; the best varieties are Wheeler's Imperial, Carter's Heartwell Marrow, Enfield Market, and the early Battersea. If a south warm spot can be spared a little sowing of Early Horn Carrot seed may be sown. The roots will be useful in the spring when the winter store is exhausted.

spring when the winter store is exhausted.

Onions.—The bulbs of the autumn-sown varieties are now matured and ready for storing, and the ground vacated by them may be dug over at once and sown with winter Spinach. It is advisable to make two or three sowings of Spinach a week or advisable to make two or three sowings of Spinach a week or ten days apart, as that first-sown will grow quickly and be most useful, but will not endure the winter like the later-sown crop. The variety known as Prickly Spinach is the best for winter use. The main crop of winter Onions should also be sown. Both the Globe and Flat Tripoli are well known standard varieties. They are very useful for pulling while young, and when a good breadth is transplanted on a highly manured piece of ground large bulbs are produced by the time the winter stock is exhausted. It is a good plan to make another sowing of carled Parsley for winter and spring use, and where the spring-sown crop has grown luxuriantly a portion of the crop may be cut somewhat closely, as the young leaves produced after this will be beautifully curled

dixunantly a portion of the copy may be the sound and able to withstand the winter. Make sowings of Turnips wherever a vacant piece of ground can be spared. Veitch's Red wherever a vacant piece of ground can be spared. Veitch's Red Globe is one of the best varieties. Sow Brown Cos Lettuce for a spring supply, and plant out large breadths for late autumn and winter use; also plant out Endive on a warm dry border or sheltered position. Broad-leaved Batavian Endive is very useful when well blanched, and it is also sought after by some for boiling instead of Spineab when the resulted in the state of the second of the instead of Spinach when that esculent is not obtainable.

WORK FOR THE WEEK.

FRUIT HOUSES.

Peaches and Nectarines.—The foliage of the trees in the earliest house is now dropping off, which should be assisted by gently brushing over the trees occasionally with a soft broom. Although a dry condition of the border is to be avoided when the trees are

at rest, excessive moisture at the roots is frequently the cause of premature growth, which must be guarded against. Earlyforced trees do not, as a rule, make strong growth, having generally a larger proportion of single fruit buds than trees that grow under more favourable circumstances, triple buds not being nearly so frequent; hence in pruning it is not desirable to cut back next year's bearing shoots unless they are of great length. Very little pruning will be needed provided disbudding has been attended to, no more wood being trained-in than is required to replace the bearing shoots of the current year and to renew worn-out growths, as well as provide for the proper extension of the trees. Trees that have long been subjected to very early forcing are seldom vigorous, but not unfrequently become so enfeebled as to need the removal of the weak growths, which, though plentifully furnished with fruit buds, are undesirable from their affording much smaller fruit than is produced by the moderately vigorous and well-ripened growths. Any trees which grow too vigorously should be lifted, whilst those that are showing symptoms of weakness should have the old soil carefully removed from amongst the roots, replacing the old soil carefully removed from amongst the roots, replacing with fresh turfy loam with about a twentieth part of crushed bones and wood ashes intermixed. A good watering should then be given both to the lifted trees and to those that have had the soil renewed about the roots. These operations require to be performed as soon as the leaves are mature and before they fall from the trees. Trees in late houses will need frequent attention in thinning and regulating the summer growths, and if they are laid-in thinner than usual it will in a measure compensate for the deficiency of sun. Gross growths, of which there are plenty this season, must be stopped or removed altogether. Endeavour to season, must be stopped or removed attogether. Endeavour to secure a balance of moderately strong wood; and to ensure its ripening as well as to improve the flavour of the fruit gentle fire heat, especially in low and cold situations, will be of great benefit. Attention must be given to syringing until the fruit commences ripening so as to keep the foliage free of red spider, and water the inside borders as may be necessary. As the fruit is gathered from the trees in the succession houses the shoots that have borne fruit. unless required for extension, should be cut away, and all the growths where too crowded thinned out.

growths where too crowded thinned out.

Vines.—The heavy rains and low temperature have been against mideeason Grapes acquiring bloom and colour rapidly, but they are very fine in the berry; a low night temperature of 60°, with moderate ventilation, will assist the bloom and colouring process, allowing a steady rise by day with abundance of air. Muscats in the last stage of ripening will need sharp firing to keep up a day temperature of 85° to 90°, and 70° to 75° at night, and light being essential to their fine amber colour it may be desirable to stop the laterals somewhat closely. Late Grapes will need constant firing laterals somewhat closely. Late Grapes will need constant firing to secure their satisfactory swelling and finish; they indeed require the same temperature as Muscats. For such varieties as Lady Downes' and Muscats which are liable to scald and have not com-Downes' and Muscats which are liable to scald and have not completed stoning a rather dry and warm atmosphere must be maintained through the night, with free ventilation by day. Inside borders must be attended to, and when necessary have copious supplies of water; and where the Vines are bearing a full crop of Grapes some stimulant, as a sprinkling of guano over the border well washed in, will be of advantage. Ripe Grapes that are hanging on the Vines will need gentle fires so as to admit of free ventilation, and if the wet continue outside borders should be covered with some material, spare lights being preferable. The canes of Vines in pots intended for very early forcing should be in the last stage of ripening; but if by reason of the cold sunless weather they are not ripening freely, fire heat should be applied, maintaining good ventilation, and supplying no more water than is needed to secure the proper maturation of the buds that are maintaining good ventilation, and supplying no more water than is needed to secure the proper maturation of the buds that are to afford fruit. Any Vines that have the wood thoroughly ripe should be placed in the open air, but they must be protected from heavy rains. Although all lateral growth is to be checked the old foliage must not be removed, but allowed to fall naturally. Early-forced Vines will have the wood fully ripe, and should have the laterals cut away and some of the long shoots shortened back, deferring the final remains, until the foliage is nearly cons. deferring the final pruning until the foliage is nearly gone. The old surface soil should be removed and forked from amongst the roots, taking the opportunity of raising any that are deep and laying them in fresh material nearer the surface, replacing the old soil with good loam, with which has been incorporated about a fifteenth of crushed bones and wood ashes or charcoal. Give a moderate watering, and the roots will push into the new soil before winter sets in. When the lifting is deferred until the leaves fall the start is not nearly so satisfactory.

Owing to the heavy rainfall herbaceous Phloxes are unusually fine, and considering the very accommodating character of these plants it is remarkable they are not more frequently grown not only in mixed beds but in shrubbery borders. Choice varieties should now be propagated either by division of the old plants or by cuttings, and such plants as Primrozes, Daisies, Polyanthuses, Forget-me-nots, Gentians, &c., may be readily increased in the same way. Lilies and Gladioli should be well supported with atakes, as in exposed situations their flower stems are liable to be broken by the wind. Columbines are fine in mixed borders. Seed FLOWER GARDEN.

should be sown now in pans, and it will produce young plants that may be placed during the winter in a frame and planted out in spring. Sweet Williams are very showy; any choice varieties may be propagated by slips, and the best saved for seed. Herbaceous plants have grown unusually strong, and need a considerable amount of tying and regulating. Anemone seed should now be sown, and that of bulbs generally, such as Tulips, Hyacinths, Irises, Narcissuses, Fritillarias, hardy Cyclamens, &c., which may be done either in boxes or in beds in open yet sheltered situations; but is preferably done in boxes, as they can be afforded protection in winter from severe frost, heavy rains, and snow by placing them in cold frames. Polyanthus seed should be sown as soon as the seed is ripe. Intermediate Stocks should be sown without delay. Sees is the. Intermediate Stocks status of sown without clearly. Cuttings of Hollyhocks strike freely in a frame with gentle heat, shading them from sun until rooted. Insert cuttings of Pansies and sow seed, saving it from the best varieties. Flowering shrubs are making more wood than usual, necessitating the employment of the pruning knife. In new arrangements the common and free-growing shrubs should be cut in closely, so that the choicer reservoing stratus should be cut in closely, so that the choicer species may have room for development. Hedges should be cut into shape; and although the shears answers well for Yew, Box, Privet, Thorn, and Berberis Darwini, such broad-leaved plants as Lanrel should be cut in with a knife. Thuja occidentalis bears clipping well and forms an admirable screen. Roses as they go out of bloom should have the faded flowers removed and be cut back, and any long sappy growths shortened so as to induce their thorough ripening. Climbing varieties, such as Marschal Niel, Cloth of Gold, Gloire de Dijon, and Climbing Devoniensis, should have the old wood which has borne flowers cut out, training in sufficient of the young shoots for next season's flowering.

PLANT HOUSES,
Greenhouse.—The greater portion of the stock of Camellias Greenhouse.—The greater portion of the stock of Camellias will now be setting the flower buds, and may if necessary be shifted into larger pots. It is important that the operation be performed directly the buds are formed, for if allowed to become large they will in all probability fall. Avoid overpotting. As to soil, nothing answers so well as a somewhat light loam full of fibre, but where this is not to be obtained a mixture of peat and loam does very well. Moderately fibrous peat also suits Camellias, and well-reduced leaf soil with a free admixture of sand. The compost should not be broken too fine, and sufficient sand should be added to render it porous. Efficient drainage must be probe added to render it porous. Efficient drainage must be provided, and beyond removing the crocks and any soil not occupied with roots pot with the ball entire, employing potting sticks to make the new soil as solid as the ball. Early-flowered Pelargoniums will now be ready to cut back. The soil should be moderately dry before doing so, or the roots will be liable to suffer. Old plants should be shortened back to within two or three bads of where they were cut to last year, but young plants should be allowed a couple of bads more to each shoot. Place the plants in a light pit or frame, leaving the lights will tilted so a to admit plenty of air. A light sprinkling of water overhead may be given every afternoon until they have started into growth, then afford no more water than is necessary to keep the soil in a moist condition. Zonal Pelargoniums grown for summer decoration will continue flowering until autumn with the assistance of liquid manure. Fuchsias that flowered early should have the shoots shortened a little, an inch or two of the surface soil being removed and replaced with fresh soil. Place the plants in a house or pit where they can be kept a little close and moist by syringing overhead morning and evening; they will then start freely, and without making much wood they will come into bloom in about six weeks. If assisted with weak liquid manure they will flower to a late period. Cuttings of Fuchsias should now be inserted; they strike freely in a close frame or wherever they can be kept close and moist. When rooted they should be potted into 3 or 4-inch pots, using good turfy loam with a fourth of leaf soil and a sixth of well-decayed manure, and a similar quantity of sand. Place the plants in a light position near the glass in a temperature of about 50° at night, and in about two months' time they will require shifting into 6-inch pots.

Primulas must, without further delay, be shifted into their flowering pots, so as to have the pots well filled with roots before winter. Good turfy loam, with a fourth of leaf soil and a similar proportion of decayed dung and a sixth of sand, suits them adremoved and replaced with fresh soil. Place the plants in a hous

winter. Good turfy loam, with a fourth or leat sou and a simuar proportion of decayed dung and a sixth of sand, suits them admirably provided they are placed in a good light pit near to the glass. They require abundance of air and a thin shade in sunny weather. Cinerarias should receive their final shift, those in pots 6 inches in diameter being the most serviceable for decorative purposes, employing soil similar to that advised for Primulas, placing the plants on a cool moist bottom in a cold frame, and admit air frealw with no more shade than is advised for the placing the plants on a cool moist bottom in a cold frame, and admit air freely with no more shade than is advised for the Primulae. Keep a close watch for aphis, as it soon spoils their appearance, and if fumigation be resorted to it must be done carefully and moderately or the foliage will be injured. Chrysanthemuns must have plenty of space to admit of their having light equally on all sides, and the shoots must be well tied out, as when they are crowded they become attenuated and lose the lower leaves, the growth not being solidified as it is made. Liquid

manure must be given liberally if they are expected to make and retain good foliage as well as flower satisfactorily.

TRADE CATALOGUE RECEIVED.

Haage and Schmidt, Erfurt .- Catalogue of Bulbs and Miscellaneous Plants.

* All correspondence should be directed either to "The Editors" or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

as doing so subjects them to unjustinable trouble and expense. GRAPES SCALDED (S. C. O.).—In a note that was published on page 88, in the number for July 31st, we directed attention to the extremely succulent nature of vegetation in consequence of the absence of sun and prevalence of wet, and urgod the importance of shading if necessary to prevent scorching on the sudden recurrence of sunny days. Our anticipations have been confirmed that injury of the nature indicated would follow if means were not taken to prevent it. You are one of a great number whose Grapes have been scalded by the want of a little timely shade and extra attention to early ventilation. You cannot restore the injured berries to their original freshness, but you may prevent further injury by following the advice given to "J. J. B." and others in our correspondence column of last week.

SWEET WILLIAMS (W. C.).—Some of the varieties are pretty, the colours being well defined, but we have recently seen flowers much superior to those you have sent us.

you have sent us.

REMOVING ORANGE TREES (G. T.).—As the roots were pruned last winter and the trees have made their season's growth they may with safety be removed now and placed in tubs, care being exercised that the roots do not become dry by exposure. We should shorten the branches somewhat now, and complete the pruning in the spring, as by the retention of a considerable amount of foliage renewed root-action will be accelerated, provided—and this is important—that the foliage is kept fresh by frequent syringings, shading also for a time if needed. Drain the tubs well, protecting the drainage with fibrous turf from which the soil has been shaken, and make the compost firm. Turfy loam, with a fourth of decayed manure and a sprinkling of crushed bones—half a peck to a barrowful of soil—will grow the trees well.

the trees well.

ROSES IMPERFECT (W. W. A.).—Green hard centres in Roses is generally the result of inclement weather, which has checked the expansion of the flowers; poverty of soil, too, is a prime cause of the evil. Some varieties are more prone to produce such flowers as the one you have enclosed than others, and we have frequently seen them on old trees of this very old Rose. Yours is possibly an old tree, and if so the soil in which the roots have long been feeding is comparatively exhausted, while younger trees in the same bed have a greater store of food. If the case is as we suspect you will do well to give the Rose very copious applications of liquid manure, thoroughly saturating the soil. This may be done at any time, and if in the autumn you remove a portion of the surface soil and apply a heavy mulching of rich manure the tree will be much benefited, and will produce finer flowers.

GERNERAS FOR WINTER (Exoniensis).—Few plants are more brilliant than these in the depth of winter. G. exoniensis is a very fine variety, but not more useful than G. cinnabarina and G. refulgens. No time should be lost in potting the tubers. Ours were potted a month ago, and growth is just commencing. We place one large tuber in the centre of a small pot, and three smaller tubers together in other pots, employing a rough open compost of turfy loam, peat, and charcoal, embedding the tubers in sand. The pots are placed in a stove, and if they can be plunged so much the better; water is given sparingly until growth commences, and then more copiously. When the pots are fairly filled with roots the plants are shifted into larger pots, and are grown on a shelf in the stove, shading them slightly in bright weather. Thus treated they produce rich velvety foliage and fine spikes of flowers of the most glowing colours. We have them in beauty during the first three months of the year.

LAYERING CARNATIONS (New Subertber).—Layering should be done as

ine spikes of flowers of the most glowing colours. We have them in beauty during the first three months of the year.

LAYENISG CARNATIONS (Nes Suberther).—Layering should be done as soon as possible after the grass is long enough to be pegged down easily, and in the following manner, as detailed in our manual "Florists' Flowers for the Many:" A layer is a branch or shoot brought down to the ground, and when rooted separated from its parent. The materials wanted for layering are a sharp small knife, a quantity of hooked pegg (the fronds of the common Brake or Fern are the best, though the pegs may be made of Birch or Hazel), and some finely sifted soil. When the shoots round each plant have made five or six joints or pairs of leaves, choose a dull cloudy day on which to perform the work; or, if the plants are in pots under an elevated awning they may be layered in any weather. Commence by trimming off the leaves from the bottom of a shoot, leaving the two uppermot on and entire. Trim off the lower leaves on every shoot before layering one, because when a layer is tongued it is easily broken off. When this is done take hold of the shoot, turn it up, and pass the knife blade through the third joint upwards, commencing the cut just below it; then reach a hooked peg, thrust it into the soil, catching hold by its hook of the layer as it descends, and press it gently, and the soil. Do the next in the same manner, and so on till every shoot is layered, then cover them all with the sifted mould about three-quarters of an inch deep, and that pot or plant is completed; then give a alight watering, and the layers want no further care till they are rooted, which will be in about a month or six weeks. Bramine them cocasionally, and as soon as roots are emitted pot them off into 5-inch pots, a pair in each; or if your space is limited and the layers small three may be put into each pot. After they are potted they should be placed under glass in a cold frame or pit, plenty of air being given in mild weather and shelter from se be replaced in the pit.

CLIMBERS FOR GLAZED CORRIDOR (R. J. S.).—Acacia Riceana, Jasminum

Poiteau, Rhynchospermum jasminoides, and Sollya heterophylla. For back wall of the other house Habrothamnus fascicularis, Cobea scandens, Lapageria roses and L. alba. Camellias would answer well, or if you wish a dense close covering of green without flowers plant Picus repens.

seria rosea and L. alba. Camellias would answer well, or if you wish a dense close covering of green without flowers plant Ficus repens.

THE RELEWEIS (B. C.).—This plant is of interest to tourists in particular and is known as Gnaphalium Leontopodium, Leontopodium vulgare, and L. alpinum. This plant has often been referred to in our columns, and we cite the following relative to it:—The Rev. H. Smelt, Wilcott Vicange, Mariborough, states the following particulars of a specimen of this plant growing in the garden of that vicange, at a height by Ordnance Survey of only 423 feet above the level of the sea. "The Edelweise in question was brought from Lucerne in the summer of 1872; it was carried for three days in paper—the little ball of peaty earth nearly dry—in a hat-bar to Frankfurt-on-Mash, where it was potted by a German gardener in German peat, in abeat the same sized pot as that known to English gardeners as No. 60, after which it had another five days with but very little water in the same hat box to this place. On arrival it was immediately planted in the open ground. During the winter succeeding whenever mow could be obtained it was carefully hesped upon it, and in the following summer I was rewarded with one large perfect bloom. Being allowed, however, to remain too long, it less its proper shape of a star, and grew into three very irregular asterisks of white felt. The very dry odd spring and hot burning summer of the next year agreed with it so well that it produced eleven splendid blooms, standing its nearly a circle round the plant. These were allowed to open well, and were gathered in June, except one left, if possible, to seed. The plant is very healthy. Every tale has its moral. The moral of this is, that instead of searching for Edelweiss from 700 to 10,000 feet above the sea, people may flash it as 482 feet, and, for aught I know, lower; and, instead of hreaking their pure persons on the rugged Alpa, they may if they like walk across their own Raglish lawns and pick it. I imagine, however, that

the smoke of the large and busy town adjacent.

FilePis Ford Small Gemenkhouse (Mrsy).—We suppose you wish for please that will afford flowers more or less throughout the year. We should have a few Camellias—vin., Alba plens, Fimbriata, Valtevaredo, and Mathotians. Analess—A. Borsig, Ferdinand Kegeljan, Jean Vervasse, and Kaiser Wilhelm. Epacities Rolipes, Hyacinthifors, The Bride, and Vesuvine; Abutilon Boule de Neige, Acadia armata, A. Riceans, Correa Brilliant, Cyclamen persicum and van. album, grandifform, noseum, and rubrum, Gytisus racemosus elegans, Hydranges hortensis, and Thomas Hogg, Kalosanthes coadnes, Bhedodendron jasminiforum, Statice profess, and Vallota purpures. In addition we should add. Fusheiss, Show Pelargoniums, Primulas, Cincernias, Tree Camations, and bulbs for spring flowering, along with a few plants of Spirase japonics, Lily of the Valley, and Roses. Avoid, however, attempting too much, and above all eschew crowding.

GRAPES DEDATING (Simulators).—The cause of the decay of the Grapes is excessive moisture in the house. A drier atmosphere and increased ventilation will prove a remest for the evil. Cut every berry out having the least trace of fungme on it, and the rest will probably remain sound. These will be no maggets if there are no decayed berries.

will be no maggots if there are no decayed berries.

ROSES FUE SIGEXY DESTRUPY (A Registers).—Only free-growing varieties can be relied on, such as Prince Camille de Roham, Contesse d'Oxford, John Hepper, Duke of Edinburgh, Victor Verdiss, and Edinburgh Vaillant; you may also tay La France. The Roses do not bird we will in analy places, the best for your purpose is undoubtedly Gloire de Dijon. Madame Willemest is also a free grower. The beautiful Noisette Celime Forusier might also succeed, as almost certainly weuld the vainable sld Engurence might also succeed, as almost certainly weuld the vainable sld Enguren Rose Souvenit de la Malmaison. We should have them on very dwarf Manetti stools, but the Rose last named thrives countly well, if not better, on its own roots. Order your plants early in October from a good Rose nusseryman, stating the purpose for which you require them, and also this you are willing to pay a little extra for selected plants. As you only want a few the extra cest will only be trifling, and will be wisely incursed.

FROPAGATING LOBELIAS (Mess.).—The and of the present women in a

pay a mease extra nor sensones panner. As you only wells a new use value cost will only be trifling, and will be wisely incorresed.

PROPAGATING LOBBLIAS (Idem).—The end of the passent mouth is a good time for striking the outsings. Select healthy growths and insert them in analy soil to be hept constantly mosts, placing the post in a frame that must be kept close for a time and shaded from bright sun. Or you may cut a few plants mather closely early in September and pot them towards the close of the mouth when they are making fresh growth. These plants, if you succeed in setablishing thera, will affined you shundance of outsings for striking in early spring. Very dwarf Lebelias often ross fresly up the stems in the amanum. If such plants are divided and dibbed in bons, partially trimming-in the growth, they will, when placed in a close frame for a time, soen form healthy plants. Abutions will strike new, the cuttings being inserted in sandy sell, which must be kept constantly moist. A close frame will be suitable, and shading and frequent sprinklings must be reserved to in bright weather. As framigation will not destroy the insects on Cinerarias dip the plants in a solution of soft soap 2 cas to a gaine of water, adding to that quantity a quarter of a pint of tobacce water. Place the plants in a very coal moist frame, or in a shaded place out of doors, but not trequire much pet room, and removing some of the old soil and top-dreasing with fresh compact may be all that is needed.

WATER LIDY PLANTING (Manchester).—The best time to plant is in

WATER LIHT PLANTING (Manchester).—The best time to plant is in spring from March until May, so that the plants may become well established before winter. The roots should be in not less than I foot depth of water, and not exceeding 3 feet. If the bottom be soft a stone or half brick may be secured to the root-stem with wire, and the plants be dropped or thrown into the water where required; but should the bottom be hard the plants should be planted in strong loam in shallow wicker baskets. The plants will be established before or by the time the basket decays. They must be secured to the bottom by some means to prevent them floating. These are a number of kinds of Water Lilies—viz., Nymphasa alba, common

White Lily: N. odorata, very sweet, and a variety of it, N. odorata minor N. candidisaima is noted for its pearly whiteness, N. pygrassa for its smallness of growth, and N. toheroes for its large root-stems. The yellow Water Lily is Nuphar lutes, another goed kind being Nuphar averas, and a very dwarf kind, Nuphar pumila minima. One of the sweetest of aquatics is Aponogroun distantyon, which with its small form minor is also very suitable for grawing in a pan in the greenhouse.

distactly on, which with its small form minor is also very suitable for growing in a plan in the greenhouse.

Sowing Carrange Sum (Sukoolmaster).—The Fulham or Early Retinues, Nouparell, and Atkins' Matchless are as good as any. A sowing sheak he made about the 31st of July for final planting-out early in September, many plants of which will be turning in between Michaelmas and Christmas and in early spring. The second and most general time of sowing, to raise plants for almost the whole year's supply, and of any lind, including the Red Dutch and its varieties, is from the 6th to the 18th of Angust, and the seedlings may remain in the seed bad all the winter if new too thick, or say number may be finally planted in the open quartees from October to Escape in the control of th

each way, the smaller earlier kinds being planted the closest.

DRAINING LAND (J. W.).—As you have only 6 inches in depth of good soil resting on a bed of clay 6 feet in thickness we should not drain despit. Drains 3 to 4 feet in depth in soil of this nature are uncless. A depth of about 30 inches (the tops of the pipes being that distance from the surface) will be far more effectual, employing 4-inch drain tites and covering them with rubble to a depth of 6 inches, and over the rubble place coarse-shaw; rects, or sticks to prevent the sell obstructing the drains. The pipes musts be laid firmly and have a good and regular fall, and may be laid in lines from 7 to 10 yards apart according to the wateses of the ground. They should fall to the lowest point where a good outlet can be soured, but should not be taken straight down the ground but obliquely. In working such soil we should the first year bring up about an inch of the clay and incorporate it with the soil, the clay beneath being well broken up as despit as peacible; by continuing this practice, bringing up a little clay cach year, you man, with the soil of measure, soon incomes the calturable depth of the soil. We know of no more cheep and useful boundary bedge than one of White Thorn, which if well managed forms a close and impenetrable fence in a few years.

a few years.

FIGS SHRIVELLING (Clifton).—When trees are excessively luxuriant they are very spt to cast a considerable portion of the crop. We suspect that the wood of your tree was not matured. We should root-prune the tree in the antenna and make the soil very firms about the roots, so as to induce share-joined wood. The growths should be thinned as that every leaf has full exposure to the light, and then, by stopping the shoots in summer after the fruit is fairly formed and watering the tree if necessary during hot and dry weather, we think the fruit will swell to maturity. You had better remove the exuberant growths now, so as to expose the shorter-jointed wood to the beneficial action of light and six.

SEEDLING FUCHSIAS (Edward Felix).—The flowers are not sufficient compact and well formed, and are inferior to varieties already in common compact and well formed, and are inferior to varieties already in common compact and well formed, and are inferior to varieties already in common compact and well formed to be a supplied to the compact and the compact and the compact are compact and the compact are compact.

compact and well formed, and are inferior to varieties already in commercial Dimarked Granes (Irial Suberder).—The black spots upon the great freat of your Black Hamburgh Grape Vine is probably the disease test-niceally tarmed "rust." A crop so affected cannot be enred, but a resurrence of the mischief may be avoided by the energies of due care in opening and closing the ventilators. Cold currents of air admitted to vineries when the Grapes are young green, and swelling fast cause rust, for the cuticle of the bury is then so tender as to be easily injured. A little watchfulness will soon convince you of this. We have seen vineries wherein all the bunches immediately beneath the top ventilaters were badly affected by rust, slight tences of it being also discernible upon a few other humbes it itsels lower down, while the remainder were quite clear.

little lower down, while the remainder were quite clear.

CATERFILLARS ON GEOGRESSMENT BUSHESS (L. G., Ipseech).—The following reply that was recently given to a correspondent is practically applicable to your question:—The caterpillar you have sent is the larves of the Gossberry Sawfly, Tenthredo grosmiariss. The female deposits her eggs closs to the sides of the principal nervures on the under side of the leaves, which is very remarkable, for all the females of this extensive family are furnished with an instrument called the saw, for the purpose of cutting into the larves and states and introducing the eggs between the cateloles or under the lexit. In about a week the larves hatch, and commence feading on the leaf on which they are stationed, and soon riddle them full of small holes; thus they go needing and changing their successive skins as they increase in size, until they are three-fourths of an inch long, when they are seen scattered round the edges of a partly demelihad leaf, holding by their fixe legs, with their tails turned up, or lying on one side. Hand-picking is the most effective leads of riddance.

INSECTS (Tyro).—It is the common Millipeds. (B. Meigas).—The Maying, Meloloutha valganis.

NAMES OF PLANTS (W. D. H.).—Circus ladariforus, the Gum Circus. (Mary).—There appears to have been some confusion in regard to the same less. No. 3 is Origanum vulgane; 4 (small spray), Brigaron some; 4 (long spline), Verbena officinalis. (W. W. A.).—1, Marchantia polymamha; 2, Claydonis furcata; 3, Lycopodium alpinum; 4, Lycopodium claratum; 5, Spergula arvensis. (James Shearer).—No. 4 named last week as Lycopodium alpinum was, we think, L. clavatum. (O. G. Roberts).—We have received no Rose from you during the present month; if we had we should possibly have been unable to have named it, as variables of Bosse and other fortists flowers.

see fir too sumerous, and many of the varieties so similar, that no one can same them except by comparing any that are cent with a large collection of fewering plants. The Zonal Pelargenium was so much crushed as to be tetally unrecognisable. If your Rose is a species and not merely a variety we will endeavour to name it if we receive a flower and foliage quite fresh and in good condition. (Rose).—The purphish-flowered Orohid with the leaf attached is Calanthe meance; the other is probably an Africas, but we cannot setembe the species from the flower cans. A. ispendeum is greenish-white spotial with rese. The small Fassion-flower is too imperfect for identification. The ownige flower is Asclepies curraenvics. (Constant Reader).—20, Cuisagu macrantha; 71, Fagus pendula, the Wepting Besch; 22, Tills platyphyla, the Large-leaved Lime; 23, Laycosteria formosa; 24, the Silver Queen Hally; 25, Waterer's Golden Holly. (A. A.).—2, Agathese celestis; 4, Coccobbe platypters. The others are insufficient for identification. (A. B.).—Adjector postators.

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

THE SUMMER GRAZING OF CATTLE.

HAVING on a previous occasion referred at some length in these columns—and especially on pages 355 and 375, vol. Exxv. -to the rearing and feeding of young cattle for early maturity and for the production of what is often termed "baby beef," we now propose to allude to the advantage and profit to be derived from cattle of full age of both sexes grasing chiefly upon pasture land, and incidentally upon the selection and treatment of the animals in a comparatively probationary state before the res are sufficiently clothed with verdime to maintain them in a fatting condition throughout the summer months. Our first point is that a considerable portion of the grass land in various districts of the United Kingdom is sufficiently rich and productive to keep a balleck and fatten it without any assistance by oil cake or other artificial or concentrated food. There is, however, a much larger portion which is just the reverse; and in order to grase bullecles with profit in the latter case it is desirable, not only for the successful fattening of the animals that they should receive a liberal allowance of oil cake or other feeding material, this is also of great importance in maintaining and improving the grass land whereon they are fed. The best districts of land for the fattening of cattle upon grass alone, ithout assistance by other food, is found in some of the river valleys which have never been ploughed and are composed of fine alluvial soils of various strata, some being so rich that for a long series of years the occupiers have continued to fatten the cattle upon the grass produce only—in fact, taking all the produce away in the shape of beef and returning nothing to the land. In such pastures it is often found that the subsoil is compesed of strata rich in phosphates and potash, the latter more particularly in some strong clays. As an instance of the fertility and fattening properties of some of these rich alluvial soils. we recollect a friend of ours about twenty-six years ago purchasing in a local market in a southern county at Christmas time a pair of large half-fattened North Devon bullocks. These he turned into a pasture with a hovel in it, where they were fed with hey and water only, until the grass became fit for feeding in the ing, when they were allowed to graze without any assistance by cake or other food until the autumn, when they again began to receive hay only as before until Christmas. They were then sold in the same market at which they had been purchased the previous year, thus having been kept with grees and hay the produce of one pasture only, one portion being fed, the other cut for hay. The cost price of these two animals was £64, and after a twolvemonth's feeding they made £64 each. We name this as a remarkable instance of what the richest grass land will do maided by artificial food, the advantage to the grasser thus ting 12s. per week per bullock, a profit which is seldom exod under the like circumstance

although we have just alluded to a pair of North Devon oxen we do not by any means recommend these for feeding in preference to other breads for profit. The best guide to the home farmer is generally to look to the bread of animals usually fed is any partisular neighbourhood er district where the farm is situated; therefore we will say Devons in the south-western counties may be kept, Sussex in the south-eastern counties, also the Berefords in the west midland counties, Aberdeens in the best Scotch counties, and Shorthorns everywhere. We must

therefore conclude that in the absence of any other breed we may, without any hesitation, take shorthorned cattle for fattening upon any pastures, except the highest mountain districts, throughout the United Kingdom. At the same time the Shorthorns, from their general approval by the graziers, are to be obtained in almost every district. Another leading point is that after being made fat the Shorthorns are more generally approved by the butcher than any other breed for the ordinary trade of the country.

After having selected and purchased our cattle for grazing on the pastures in the following summer we prefer to take some of them into keeping in the early part of the winter, so that the animals may become acclimatised and forwarded in condition. Whether we have selected worked oxen, or young steers, or barren cows, they should be kept in yards made comfortable for them by shalter sheds, and properly bedded and littered with straw or other materials as cleanliness requires, taking care, however, to have the yards always earthed at bottom, not only to absorb the arine but to ensure a drier and healthier lair for the animals. During the time the cattle are fed in the yards it is customary to feed them upon farms where there is a portion of arable land through the winter with chopped straw and roots pulped in admixture. Upon farms, however, without arable land it is usual to feed them with hay chaff mixed with oil cake, ectton cake, been, barley, or make meal. This mode of feeding will have brought them forward enough in condition to enter upon grass feeding in the spring with great advantage. They will, if fed as above stated, have laid the foundation of lean meat, and be in a condition for laying on the fat whilst feeding on grass only in the pastures; and they will at the same time, having been in the yards during the winter, have made a large quantity of valuable maxime if care has been taken to bed and litter them properly. When, however, the cattle leave the yards entirely, which they will usually do in ordinary seasons about the first week in May, it must be considered whether the pastures are of first quality or only second rate. In the former case the bullecks will require nothing but the grass with free assess to good water and rock selt at all times; but in the latter ease, where the pastures are comparatively inferior, the animals will require assistance by feeding with cake or meal as before stated.

Thus it becomes a question when cattle are feeding on the pastures how they should receive their cake or meal. roots are available mangolds should be held over for summer use, for there is no better or more economical method of giving meal than in admixture with cut mangolds or other roots. In the case, however, of there being no mangold reserved or grown the cake is frequently laid in little heaps upon the grass ground. The animals soon learn to eat it in this manner, and although it is a slovenly soon learn to eat it in this manner, and atmosgn is a savely way of feeding it is simple and gives less trouble than trough feeding; and the cattle, when they become accustomed to get their cake in this way, will eat and lick it up quite clean. In some situations, particularly in the mild climate of the southern and couth-eastern counties, the animals will require some shelter and shade during the hot and sunny days and to protect them from the flies, which in some districts are extremely annoying to the cattle, and irritate them so much that it is quite impossible for them to thrive as they should do. On some farms trees are left on the pastures for shade. This is, however, in our opinion, a very erroneous plan, because when the animals resort to the shade offered by trees it does not protect them from flies, nor does it preserve the dung dropped by them; but, on the contrary, the draw is left under the trees of t dung is left under the trees, where it does no good. In our estimation this is an important matter, and particularly when the cattle are having cake or corn, which should go to benefit the grass land as well as assist in fattening the animals. To meet the requirements for shade and shelter, and feeding cattle whilst feeding on the pastures, we have designed and erected upon several estates elongated sheds, which are placed in such a cautral position as to be accessible to the cattle when feeding on any adjoining pastures; and as they become accustomed to be fad there once a day with cake, corn, &c., they the more readily take to the building for shade or shelter as they may require. The building sheuld consist of a shed of such length as may be required, having reference to the number of cattle to be accommodated, the width being 16 feet, with a feeding path 83 feet wide, divided and railed off into 12 feet by 12 feet boxes sufficient for two bullocks, with a store room at one end for hay, straw, roots, cake, or corn. The building should be thatched with reeds or straw, as being cooler in summer than either slates or pantiles. The floor of the boxes may be excavated 1½ foot deep and filled with earth for littering with straw and accumulating manure, or may be filled with sches or peat to absorb the urine, the solid dung being removed as cleanliness diotates to a manure heap. In either mode of management the manure is in a convenient place for applying to the adjoining pastures.

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour will still be employed at every opportunity in the tillage of the farm, either preparing for late turnip crops, rape, or

mustard, &c., also horse-hoeing, and the interculture of root crops generally. Horse labour will now be required for the reaping machine in the early districts. Winter oats, rye, the Canadian and other early white oats, will be forward enough for cutting; and in order to make long days at this work, now the reaping and tying machine is come into use, it will require change of horses. The work is severe for the animals, and in order that the work may proceed without delay each relay of horses should not be worked beyond four hours at a time. The tying with wire has been objected to, and yarn or twine is now recommended instead; but in point of fact wire need not cause any difficulty, because in cutting the wire at the time of threshing the sheaves, it is now cutting the wire at the time or threshing the sheaves, it is now removed by the instrument used in cutting, and none will be found in the straw when properly attended to at the time of threshing. Carting of hay and stacking will still be going on in pasture districts, and also upon the water meadows where sheep had fed early and that were laid up for hay afterwards. The cost of labour in mowing, stc., in the water meadow where the mowing machine and the product of the state of the cannot be used is a great drawback to such pastures as compared with the value of produce of such land at a former period when labour was cheaper and more plentiful, especially the labour by women and boys. The interculture of root crops will still require constant attention by horse-hoeing, the weeds having been so abundant this year amongst the root crops, and the weather so much against their destruction, it will increase the labour for a much longer time, in fact up to the time when harvest is com-menced. The home farmer should remember that it is best to menced. The nome narmer should remember that it is best to have as much of the root crop set out and cleaned before harvest commences, all such being done at nearly or quite double cost during the harvest periods. In fact, it is frequently impossible to get such work done at all when harvest work is going on. All the late-sown turnips will probably require hoeing by hand during the harvest, but in those cases where hand labour is scarce the horse hoe may be used with great advantage and economy both between the rows and across them. In critique out the roots between the rows and across them. In cutting out the roots crossways it leaves the plants in breaches, but nevertheless it saves them from being stunted, and maintains them in a growing state until the hand labour can be obtained for singling and finishment of the roots. ing off the work. In setting the hoes to work crossways we use three cutting shares like the centre share in an ordinary horse hoe, in fact such as we use in horse-hoeing wheat when drilled at 12 inches; the shares then each cover about 8 or 9 inches.

12 inches; the shares then each cover about 8 or 9 inches.

Hand Labour should be cleared up as close as possible to the commencement of harvest. For instance, where it is intended to sow stubble turnips, as fast as the corn is cut the manures required for drilling should be got ready and mixed with ashes, so that no time may be lost in light work and trivial matters during the harvest. The hiring of a sufficient number of hands for harvest work should be attended to immediately, and an arrangement made as to the prices to be paid for labour. These matters are more particularly necessary in those situations where labourers are rather scarce, and where the labour required in harvest time is far beyond the neal staff of men and women namely employed. far beyond the usual staff of men and women usually employed upon the home farm. We urge this matter of obtaining sufficient labourers in order that the horses may not stand in the stables or be turned out to graze in the early part of the harvest, for the purpose of having the teamsmen and boys at liberty for harvest work; for we consider that the value of horse labour during the first week or ten days of the harvest is of as much or more value first week or ten days of the harvest is of as much or more value in the fields than at any time in the whole year, because m case of no stubble turnips being sown the autumn tillage by the scarifier may be begun in preparation for root crops for the next year. Instead of sowing stubble turnips in a late harvest like that which we are now anticipating, it will be well to sow the trifolium of the different varieties immediately the corn is cut, and harrown upon the corn stubbles, &c., between the stooks or pooks of corn. In this we may hope to avoid the slugs, the greatest enemy we have to contend with in trifolium cultivation. The shepherd and cattlemen will now he fully employed and he required to feed the sheen men will now be fully employed, and be required to feed the sheep liberally, and particularly the Down ewee, which will now have liberally, and particularly the Down ewes, which will now have the rams with them. In case the ewes are in low condition or feeding on bare keep in grass, it will be necessary to give them a daily fold of rape or mustard, and a few cracked beans if it is desired to have early lambs. The yearling-off heifers, too, should be liberally fed with a constant change of pasture, selecting the highest and driest land for the night lair; they will then probably offer to the young bull which should now be with them, and this is desirable so that they may bring their first calf in the May month. The calves, too, of various sizes must be properly fed and is desirable so that they may bring their first cair in the May month. The calves, too, of various sizes must be properly fed and cared for, when they are quite young as weaners they will get milk and meal only, except a little sweet hay to pick, or if turned out at daytime to learn to eat grass it should be in a dry sheltered paddock, and if with a hovel in it so much the better in wet or stormy weather. Cabbage seed should now be in beds for planting in the autumn and early approx in the autumn and early spring.

THE FORTHCOMING DAIRY SHOW.

THE prize list of the fourth annual Dairy Show, to be held in London by the British Dairy Farmers' Association on the 18th

and four following days of October next, contains offers of plate, money, and medals to the estimated value of about £1500, and is divided into live stock—comprising dairy cattle and gosta, poultry and Pigeons; dairy produce, including clotted cream and dairy salt; dairy utensils, comprising apparatus for cheese and buttermaking, vehicles for conveying milk, milking machines, and cowhouse fittings; and finally models and drawings of dairy homesteads. Several alterations and additions are noticeable in comparison with the schedule of last year, the most important of which are the following. of which are the following :-

of which are the following:—
Cows.—In Shorthorns, not eligible for the Herd Book, four prizes are to be awarded instead of three, and the entries will be made singly and not by pairs. The "any other breed" class, both in cows and heifers, will admit pure specimens only, in hopes of bringing forward Devons, Dutch, and other good milking varieties, the "crossed or mixed" having then a class to themselves. The class for "any other breed of bulls" is similarly changed to any other "pure" breed.

GOATS.—An extra class is provided for "maiden" goats over twelve months and under two years with a view to discourse.

twelve months and under two years, with a view to discourage the practice of too early breeding. A silver medal is offered for the best kid.

CHESS.—The Stilton class is open to makers only, and the prizes doubled in value to encourage manufacturers. An additional class appears for "loaf cheese," and one for cream or soft cheese. Fair.—Entries here are also restricted to makers this year, and the first prize is a gold medal and £10, instead of a silver medal and £30. The champion prize is done away with in the cheese classes and fair, it being justly considered impossible to designate the best cheese out of so many different kinds. Foreign.—This is the best cheese out of so many different kinds. Foreign.—In a classified under the various known varieties in this country, such as the Roquefort, Gorgonsola, Gruyère, Parmesan, Edam, Goudar, and Soft Cheese, instead of the plan previously adopted, as French, German, &c., thus offering fair competition in each class between specimens of the same kind, which before could not possibly be

Clotted cream is now added, with a silver and bronze medal as

Clotted cream is now added, with a silver and bronze medal as prizes for the two best samples of not less than 8 lbs.

BUTTER.—Fresk.—In order to better apportion the prizes to the number of entries, butter made from the milk of Channel Islands cattle, which has generally the advantage over other makes, is classified by itself, the remainder being subdivided into lumps of 2 lbs. and prints of 1 lb. Cured.—Scotch and Welsh this year will compete together in the "any other variety" class. Foreign forms but two classes—"fresh" and "cured," instead of "fresh, salted, or preserved" being all jumbled up together under the names of the various countries whence they are sent, which has hitherto resulted in a series of empty classes.

Dairy salt forms a novelty this year, the prize being a silver medal. The quality is to be judged by analysis.

DAIRY UTENSILS.—Medals are offered for the best collection

independently of those shown in action, thus having a class to themselves. In cheese and butter-making the fees are reduced from £5 to a guinea in order to encourage manufacturers to compete Milking machines, with a silver medal as prize, are also a novelty

on this occasion. Vehicles for the conveyance of milk have three classes instead of one, being divided into those for station purposes, for retail delivery, and for perambulators or trucks.

Models and drawings will be designed this year for the accom-

modation of from twenty to eighty cows instead of from fifty to one hundred, and the fee of entry is reduced by one-half. One great feature in the schedule is the reduction of entry fees to members of the Association, by which subscribers are allowed the advantage of 25, 80, and in some instances 85 per cent. discount upon the fees of non-members.

Schedules may be obtained of the Honorary Secretary, Mr. H. S. Holmes Pegier, at the offices of the Society, 446, Strand,

MOULTING.

We have before written about moulting, but as the season comes round we find it well to remind our readers of the special points to which care should be given in the poultry yard. We should expect fowls to be late this season in going into the moult; summer heat generally hastens it, and of that we have had little enough as yet. At the last show, too, which we saw late in May, birds were in much better plumage than they usually are at that time of year. Our birds have thus far, however, been most irregular in beginning to change their feathers; some have been quite ragged for a month, others are still in plumage fit for the show pen. The year is strange, and many things come about contrary to expectation. As far as our observation goes the birds which have been early to lose their feathers are those which have warm houses into which they are shut at night, and in which they consequently pass many hours in a much higher temperature than that of the external air; those still in plumage are the birds which roost under rough sheds and feel the cold and damp of night. WE have before written about moulting, but as the season comes

Moulting may be hastened or retarded, therefore it is useful to observe the month in which we find it best for poultry to moult. It is common to hear fanciers say in June, "See how well my birds are going into the moult." For our part we prefer the birds not to lose their feathers till the middle of August, especially the hens, for we have observed that if they begin to do so earlier the moult is almost always a partial one only, and they generally then fall into another in November, just when the exhibitor wants them to be in good plumage for the great shows, and they remain weak through the early winter when everybody wiske heas to lay. With cocks the moult is a different matter; the reformation of tail and hackle feathers takes a long time, and the operation is rarely repeated in the same season: the sooner therefore that they begin to drop their strong quill feathers the better. Those cocks seem to go best through the strain which first lose those feathers, and then when the new ones are half grown drop all the body feathers at once; these are rapidly replaced, and the birds' full plumage is seen altogether in its fresh beauty.

How are we, then, to hasten the operation when we desire to have the birds in plumage for the autumn shows? We should separate cocks and hens now, and take care that all go into their henses at night. The former we should place in enclosed runs, small and warm quarters seem to promote the moult. Care must, however, be taken to keep all birds out of the sun when the fresh hackle and saddle feathers are coming; it would be sure to tinge all pale and delicate, and indeed almost all colours, and spoil them for the season. The moult of hens of all sitting varieties may be much more easily hastened. By this time of year they become broody after laying small batches of eggs; let them amuse themselves with sitting for a month on a china egg or two. If they are then taken off the nest and shut up for a few days in an exhibition pen they will go to pieces all at once, and we always find that hens which do this, even though they look for a week or two like naked skeletons, pass best through the moult and come most quickly into full plumage. Those who require autumn chickens for winter use can give their hens some real eggs now in lieu of sham ones; the effect will be the same, only that they will moult a little later. They will be all the better for the good food which they will get with the chickens and for the warmth of the coop. It is a good plan to rear crossbred chickens at this time of year; the great strength thrown into the constitution by a fresh cross enables them to reasist the chills of autumn. For this purpose the cocks, instead of being isolated, may have one or two hens given them of some other sorts and of no great value. We think it unsafe ever to put hens of great value as stock birds with a male bird of a different breed.

As to food to stimulate the moult special diet is rarely needful, and, as we have often said, we abhor stimulants. Iron mixture in the water is very useful and should constantly be given. A minute quantity of saffron, too, may be boiled in water, and a few spoonfuls of the decoction occasionally put in the water. If the cocks become very pale in comb they may have a little Spratt's food mixed, according to directions we have often given, with other meal; but avoid stuffing them, because they are moulting. We have known obese and useless birds quite cured by reduction; on the other hand, we have seen several instances in which peculiarly fine cocks have been fed highly with bread and ale and ether dainties to get them on, and have died in sudden fits just as they were attaining full beauty and were entered for Birmingham or the Crystal Palace. Hens, too, should have the iron tonic, but not any stimulant at all. Such foods only make them produce eggs instead of feathers, and excite them when the system should be somewhat dormant.

be somewhat dormant.

Occasionally it may be wished to retard the moult of a hen for a September show; we object altogether to show at this time of year. Still, if this should be necessary, and some hen promises to retain her plumage, separate her from the cook entirely, let her roots in a cold place, give her no nest egg, remove those she lays daily, and should she show the slightest inclination to become broody turn her off the nest at once. We have occasionally kept a hen in plumage in this way; but the probability is, that should the show room be hot, when the judge comes round in the morning a sudden moult will have come on, and the bird will be standing on a regular feather bed of her own down. We have known instances in which inexperienced exhibitors have put down such metamorphoses to foul play, and have fancied that their favourites had been plucked!—C.

VARIETIES.

DURING the past few days the weather has considerably improved, and has had a marked and beneficial effect on the grain crops, as well as having facilitated the securing of hay, which for many weeks has been exposed in the fields. In the south of Ragland the corn is at last "changing" and an Essex correspondent informs us that harvest has commenced on the light lands of that county by the cutting of rye. Wheat crops in the same district—that is, on light soils—are looking well, as also is barley; but on heavy lands weeds predominate, and the harvest, even under the most favourable weather influences, must be a very un-

satisfactory one. Root crops, too, are extremely late and poor; and potatoes, except the latest sorts, are almost wholly destroyed by the murrain.

—— AT a recent meeting of the Council of the Royal Agricultural Society the Finance Committee reported that the balance at the bankers on July 81st was £15,711, and they recommended that the Secretary be authorised to sell out £10,000 New Three per Cents, now standing in the name of the Society, to meet the claims arising from the Exhibition at Kilburn. In presenting this report Colonel Kingscote said it had been found impossible to state the exact loss resulting from the Exhibition, but so far as could be ascertained it would come to about £10,000.

— In some of the old poultry books allusion is made to "hen-cocks"—i.e., fowls which were apparently neither cocks nor hems. This has often been derided as a mistake, and it has been asserted that such are always old hens which have partially assumed the male plumage. We have this year frequently seen a young bird which is apparently an instance of the shormal monstrosity. It is a Silver-Grey Dorking with the head and expression of a hen, but the plumage of a cockerel. It carries its tail somewhat low, but is fast assuming the hackles and mature plumage of a cock.

— The Value of Bees.—A bee-master of repute, the Rev. M. Sauppe, in Ltickendorf, makes the following calculation, in-

— The Value of Bres.—A bee-master of repute, the Rev. M. Sauppe, in Litckendorf, makes the following calculation, intended to prove the great agricultural and economical importance of the rearing of bees:—Of each of the 17,000 hives to be met with in Saxony, 10,000 bees fly out per diem—equal to 170 millions—each bee four times, equal to 680 millions, or, in 100 days, equal to 680,000 millions. Each bee, before flying homeward, visits 50 flowers, therefore the whole assemblage has visited 8,400,000 millions of flowers. If out of the ten only one flower has become fertilised, 340,000 millions of fertilised flowers would be the result. Supposing the reward for the fertilisation of 5000 flowers to be one German pfennig, the united bees of Saxony have obtained per annum a sum of 68 millions pfennige—680,000 marks (£34,000 sterling). Each hive represents in this way a value of £2 sterling.

value of £2 sterling.

— Wz understand that Spratt's patent food will be supplied to the animals at the forthcoming National Show of sporting dogs at Birmingham. This food is being supplied to the dogs at the present Birmingham Hound Show, and gives great satisfaction.

TAKING BEES TO THE MOORS.

HEATHER, it is well known, yields honey in great abundance. This plant flowers freely, generally speaking, and comes into blosom in August when clover, limes, and bramble bushes have passed their flowering season. Heather is of some, nay, great importance in apiculture. In favourable seasons it gives the bee-keepers in many districts the chance of an additional month of honey-gathering. In such seasons when the bees are taken to the moors they have a time of activity and noise; they gather abundance of honey; the outdoor workers seem to be in a tremendous hurry to accumulate stores, running out of the hives and flying off to the heather as fast as they can. Hives speedily become heavy; breeding recommences; the indoor workers are overtasked, and cannot carry aloft and store away all the honey that is brought to them. A wet day or two interfering with outdoor labour is not all loss and hindrance, for the bees in such days attend to home duties—carry aloft the accumulations of honey and lock it up. In this way the arrears of indoor labour are met and removed, and preparations made for the reception of future accumulations. Any observant bee-keeper cannot fail to remark how fast the bees of strong stocks with empty cells work when honey is abundant, and also after a short time of rest during a flush of honey.

The practice of removing bees to the moors is common and general in Scotland and Germany, but not so common in England, still many apiarians here resort to it with advantage. In many counties, both north and south, the heather of England cannot well be surpassed for excellence. Here, in this north corner of Cheshire, we are about twenty miles from Delamere Forest, in which there are thousands of acres of excellent and accessible heather; and about the same distance from the Glossop Moors, which may be said to be ranges of hills in Derbyshire, clad with heather. We have hitherto preferred the moors of Derbyshire, and our bees have been taken there nearly every season for

sixteen years.

Our hives have cross sticks in them, and can bear pretty rough handling or treatment by the way. To guard against suffocation is the only necessary precaution in our case. The hives are well ventilated by placing over their doors and crown holes fly-proof wire, and in this way fresh air is admitted and thorough ventilation given to the bees during the journey to and from the moors. Without good ventilation suffocation is likely to result, for when the doors of hives are closed all natural ventilation ceases. Some bee-keepers ventilate their hives by tying thin towelling over their mouths, and raise them off their board about 2 inches. There are other modes of ventilation, and probably everyone thinks his own plan the best.

The time to remove bees to the moors depends on the se In 1868 we took ours on the 24th of July, and were not one day too soon; again we have been as late as the 20th of August, and were not a day too late. This year the heather, indeed every kind of crop, is unusually late; and when we remember that almost every season the weather fails before the heather, that very seldom after season the weather fails before the heather, that very soldom after the first ten days of September do bees gain in weight even though the meens be clad and bright in their purple robes, we are compelled to consider this season whether it is or is not advisable to take ours. Evidently the heather will not be in full flower till September this year, and if the present rainy weather continue much of the heather will not blossom at all, or not blossom to the continue much of the heather will not blossom at all, or not blossom. to be of advantage to been. The bees in Scotland have hitherto done but little good on the clover this year by reason of the cold rainy weather, and almost all the bee-keepers I met there intend, or did intend when I left them, to take their hives to the heather. Having known hives gather 50, 60, and 79 lbs. each on the moors making known myes gather 50, 50, and 10 ms. each on the moors in a short time, I dare not advise anybedy not to take them this year. For me to take mine would be an adventure. The expense would be about half a crown per hive, the risk of losing bees during stormy weather very great, and the prospect of gain but small. Half a crown will buy 10 fbs. of good sugar, and this boiled into good syrup and properly administered to a hive will be about enough of food for a hive of ordinary numbers or treated thill the amount of the province of the state o strength till the spring of next year. A great philosopher in our township, I am told, predicted that this year, 1879, would be one of calamity by reason of spots on the sun. It certainly has been a year of disappointment to bee-keepers, but let us hope that the spots will be off the sun before he makes his appearance in March, 1880, and that a good season will follow.—

A. PETTIGREW, Sale.

BEES AT THE BIRMINGHAM SHOW.

THE Rev. Herbert Peel seems to have set before him the esta blishment of a bee-keepers' association in every county in England and with a view of setting the ball rolling in Warwickshire he, in conjunction with Mr. Villiers Blakemore, determined to hold an conjunction with Mr. Villiers Blakemore, determined to hold an apicultural exhibition at the annual show of the Birmingham Botanical and Horticultural Society, by whom the prize money in this case is provided. To the kindness and energy of the latter gentleman much is due, while he must be gratified at the intense interest excited by the Exhibition.

The hives, with but one or two exceptions, call for little comment beyond what they have already received in these columns in our reports of Eilburn and South Kensington. Mr. Fuggle, however, in Chase C. for the best and cheapest hive for cottagers' use.

ever, in Class C, for the best and cheapest hive for cottagers' use, shows a really good article, well made in yellow deal with sections and super cover, for 10s. 6d. The sections are arranged thus:—On the hive sides, when the sections are in position, rests a wooden frame about 4 inches deep. This frame is, in fact, an extension npwards of the hive proper to give room for super honey. Over this frame are placed as a cover seven slate which touch at their edges, and on the under side of the slats are fixed the sections by a single screw, so that the lifting of the slat brings up two sections by a single screw, so that the lifting of the slat brings up two sections with it, and at the side of these a dummy is used to give lateral movement, and thus facilitate the removal of the boxes when filled. The plan is simple, and is more likely to be worked successfully by cottagers than many we have seen. This hive deservedly stands first, while Mr. Green makes an excellent second with his Cottage Myrtle, with which the readers of this Journal must be familiar. In honey nothing worthy of remark was shown, nor could indeed such be expected with such a season as we have experienced.

we have experienced.

In the driving competition the times were wonderfully short, Mr. C. N. Abbott driving and transferring in 9 min. 45 sec., Mr. Walton in 11 min. 56 sec., and Mr. J. Abbott in 12 min. 56 sec.
The great attraction of the Exhibition was, however, the bee tent in which Mr. Cheshire lectured to crowded and delighted audiences, Mr. Walton acting as his operator. The manner in which the bees were handled filled all with extreme astonishment, while the descriptions of the wonders of the anatomy of the insect and its descriptions of the wonders of the anatomy of the insect and its marvellous adaptation created so much interest that the accommodation the tent afforded was sorely taxed, hundreds waiting for admission at the close of each display. At midday on Saturday Mr. Cheshire lectured through an interpreter (Mr. Fowler) to the deaf and dumb school, whose power of communicating to the children was as marvellous to the onlookers as was the tameness of the bees to them.

or the bees to them.

The primary object of the gathering has been achieved, in that many have signified their intention of joining the proposed Association, while Mr. Bower has been requested to accept the honsecretariat. If he accept, as we are given to understand he is likely to do, the Warwickshire Bee-keepers' Association may be regarded as a fait accompt.

OUR LETTER BOX.

YOUNG RABBITS DYING (H. S.).—The age at which your Rabbits die suggests that from some cause or other they are unable to pass through the

period of moulting. Rabbits are born with fine, omly, woolly, dull far darker than that they will have when older. About the age of from thirty to forty days this fur falls off, and it is replaced by a permanent fur that gives the foundation and the particularities of its coat. This crisis of nature passes unperceived if the Rabbits are kept warm, clean, and the mother has been well fed to allow of her being a good nurse. Separated from their mether they must have food consposed of grains and green plants. If moulting is not a disease it is, nevertheless, a crisis of nature which happens at teething, and which may give rise to many symptoms and affections. Convulsions occur when moulting does not take place at the time prescribed by nature; the Rabbit becomes low without appetits, and it is not rare to see it asised with convulsions, which succeed each other by frequent fits, and which cause death within twenty-four hours. Treatment—The dissection of bedies show disselected tissues—a red liquid in the intestines. The treatment consists in keeping them warm with fifteen grains of camphor a-day, and as soon as they can eat give them watercresses and a little boiled barley with a little salt.

FEREDING FOWLS (E. R. P.).—There is no advised proportions in mixing

FEEDING FOWLS (E. R. P.).—There is no advised proportions in mixing make or crushed cats with boiled vegetables. The more of the corn that is given to the fowls the more their fattening is promoted. We should not add more than one pound to even of the vegetables.

add more than one-peum to seven of the vegetables.

RENOVATINE ERGIST MEADOWS (A. O.).—In the case of meadow had lying too low to be drained, we have had some instances of improvement having been effected by the addition of road scrapings or elean fine gravel, if the land is pearly, laid on and spread several inches desp. This application of compost, &c., will make the land firm and more productive; but in the event of manure being required, we recommend a top-dressing of 4 owt. to 6 owt. of mineral superphosphate per acre. We have lately had an illustration of this where the pasture laid low and cold, and the small fine rushes predominated in the bertage; yet, since we have applied the above named dressing, the cattle graze so closely that they cat the rushes now as well as the graze.

REMARKS.

6th.—Coel but fair; not much sunshine; very slight shower 2.50 P.M., 7th.—Fine sunshiny morning; overcast by 2 P.M.; shower at 3.5 P.M.; heavy shower at 3.5 P.M.; wet evening.
8th.—Fair throughout, but very dull.

8th.—Fair throughout, but very dull.

8th.—Fair throughout, but very dull.

9th.—Very dull in early morning, afterwards fine bright day.

10th.—Fine bright morning; but from 10 A.M. very thick and fog-like; very little sunshine after 11 A.M. but no rain; very calm.

11th.—Fine bright morning; cloudy during the day, at times very dark and storny-looking; very calm all day; starlight night.

12th.—Very fine bright day; hot sun, but cool pleasant wind.

A fine dry week, but cooler than the previous one, and rather below the average for the time of year.—G. J. SYMONS.

COVENT GARDEN MARKET .- AUGUST 18.

THIS warm weather is sending the soft fruit in fast, and this week will see the bulk of it. Demand has been good at improved prices. FRUIT.

LIFTING AND RENOVATING VINES.

HEN the lifting of Vines is deferred until

the leaves fall the start is not nearly so satisfactory," is a sentence of considerable importance which I extract from the practical instructions given in "Work for the Week" of your last issue. Having lifted Vines at different periods of the year—namely, in summer, autumn, winter, and spring, and having adopted various modes of renovation in dealing with Vines and Vine borders, I may perhaps usefully communicate a little of my experience on this subject. When I was a much younger man than I am now, and intensely in earnest in gathering knowledge on practical gardening, I remember with what pleasure I read articles in the old "Cottage Gardener" when they appeared just in time for the instructions contained therein to be carried out; and, on the other hand, how disappointed I was when an article was published just too late to be of use to me. I therefore refer to the subject in hand now, not because I feel that I have anything new or of great

Grape-growing is either one of the greatest pleasures or the greatest troubles of the gardener—pleasure when the crops are good, and he is proud of showing them; trouble when they are a failure, and he is afraid of visitors seeing them. In some cases where Grape crops are notorious for their inferiority the fault rests with the manager; in other cases the failure arises from causes beyond his control. If a gardener has well constructed and efficiently heated vineries provided, has abundance of good soil at his command, and has had full liberty to carry out his plans without hindrance for a number of years, and he yet fails to produce good Grapes, then we are driven to the conclusion that there has been an error in management somewhere; but, on the other hand, if the houses are radically bad, dark, heavy, tambledown structures, or if they are situated in a swamp, or in a district where the soil is comparatively sterile, and for agricultural purposes dear at 10s. an acre (and good soil cannot be purchased), then superior Grapes cannot be expected. Again, if a gardener unfortunately inherits from a predecessor Vines in a thoroughly bad state, carrying poor crops of fruit and large crops of mealy bug, he is to be pitied, and certainly ought not to be blamed if he fails to

importance to record, but mainly because what I have to

say shall be said in good time to be of use, if any use can be extracted from my observations on lifting Vines.

Nine good gardeners out of ten would in a case of the kind just noted advise that the old Vines be removed and also the old borders, that the house be thoroughly cleansed and painted, that new borders be made and young Vines be planted. That would be attacking the evil at its root and laying a firm foundation for future success. But owners of Vines do not always see things in the same light that gardeners do. Perhaps it is within the recollection of the former that new borders have been made at considerable expense and young Vines planted, and yet the present

render the Vines clean, healthy, and productive in a year

unsatisfactory results have followed. It is then not surprising if an employer hesitates in accepting the advice of a new gardener until he has had some proof of his abilities. The gardener under such circumstances may possibly feel a trifle uncomfortable; but if he reflects a little he will perhaps admit that his employer is only exercising reasonable caution and ordinary prudence.

Confidence is only gained by proving that it is deserved. It is often a hard struggle to win it, but with ability, perseverance, and industry it is to be won. One of the best modes that a gardener can adopt to "get his own way" is by proving himself willing to make the best of the plans of his employer. It is always true policy to make those plans a success if possible. Try them fairly and honestly. If they succeed fairly well mutual pleasantness will result and confidence will be more than half won; if they fail most employers, conscious that the utmost has been done to achieve success, will readily acquiesce in a change of plan, and the gardener, then of proved worth in the em-ployer's estimation, will have pretty much his own way.

A quarter of a century ago I succeeded a gardener who had spent five miserable years in fighting an employer over some old Vines. The gardener was stubbornly determined to have the old Vines out and have young Vines planted; the employer was equally determined that if possible the old favourite Vines should be renovated. It is easy to determine who would lose in a contest of that kind. Finding what above all things was coveted-namely, presentable Grapes on the old veterans, I determined to try and produce them. I entered on my duties in August, and the first work I did was to attack the Vine border. The first step to the renovation of the Vines was a rude one, but it answered. The rafters were 4 feet apart, a Vine being planted under each rafter. I simply dug trenches across the border of one house exactly between the Vines, these trenches being 2 feet wide and as deep as the border. Most of the roots found were cut off smoothly, as I felt certain there would be sufficient in the 2-feet-wide ridges remaining to keep the Vines alive until new roots were produced. The trenches were filled with manure, vegetable soil, decayed leaves, burnt refuse, and a little loam to check undue fermentation. The mass heated slightly. On examining the cut ends of the roots a month afterwards I found them callused, and in October there was a fringe of white fleshy rootlets just entering the manure. In the meantime the Vines were syringed regularly to keep the foliage fresh and no laterals were cut off, and thus rootaction was encouraged. The foliage was retained longer than usual, which was a good sign. In November pruning was done. The spurs were not more than 6 inches apart. A selection of the best was made, and the others, more than half, were sawn off nearly but not quite close to the rods, and smoothly pared with the knife. The young wood on the spurs remaining was not pruned closely, but some of the young growths were tied up to the rods and shortened at the best buds, the eyes at the base being almost invisible, and obviously of little use. In the spring the old Vines broke better than they had done for years past and some very fair bunches were produced: young growths also

NO. 980,-VOL XXXVII. NEW SERIES NO. 1612.-VOL. LXIL, OLD SERIES,

issued close to the main rods, as I rather anticipated they would when cutting off the old spurs. These were encouraged, and every shoot was removed that was likely to interfere with them. In the autumn were cut several acceptable dishes of Grapes, good wood was provided for another year, and an opportunity afforded for removing some of the other ugly spurs. The year following, knowing there were plenty of roots in the manured trenches, a width of 4 feet was dug out from the entire front of the border, chopping the roots off as before and filling in with rich compost the same as in the trenches. The "crust" was taken off the ridges at the same time, just baring the roots, which were also covered with fresh compost. After that the Vines grew vigorously and produced serviceable crops of fruit.

The border of the second house was entirely removed in the autumn (November), the best roots being carefully preserved and the others shortened, and the Vines were planted in a new border of good turfy loam with slight manurial additions. Pruning was done as above described. The Vines improved, but not so quickly as the others, for instead of new roots being produced in the autumn they were not produced until the following June, when the Vines were in leaf. The Vines in the third house were lifted, and the border was renewed in March just as the buds were swelling. Great care was taken to prevent the roots being dried during the lifting process, and the Vines in both houses were treated the same in every respect. They were grown as coolly as possible, so that the stored-up sap in the rods was not exhausted before fresh roots stored-up sap in the rous was not caused before fresh rous were produced to continue the supply. The spring-lifted Vines started better and grew more freely than those lifted in November, but eventually both houses produced good crops.

When Grapes became plentiful it was suggested that one of the houses could be planted with young Vines without any material check being experienced in the supply of fruit. The response was very different from what it would have been three years previously. By doing what my employer wished then I had full liberty, readily granted, to do as I liked now. My plan was this:—A brick wall was built inside the house parallel with the front wall, and 21 feet from it (the hot-water parallel with the front wall, and 27 leet from the hot water pipes not permitting a wider space); Vines were raised from eyes, and in June were turned out of the pots and planted in this narrow inside border, the growing canes being trained between the old Vines, which had their laterals pinched more closely than usual to admit light to the youngsters. These grew freely and produced good canes the same season. The following year the old Vines were denuded of their spurs at the lower half of the rods, the top portion being cropped heavily, and afterwards the old Vines were taken out entirely, the outside border removed, arches made in the front wall and a wider feeding ground given the young Vines that until then had been confined to the narrow border inside. whole of the range was eventually treated in the same manner. and both employer and gardener were well satisfied with the

I have lifted many Vines since then and renovated other houses, and have arrived at the conclusion that the end of August or the beginning of September is the best time for root-pruning old Vines and enriching old Vine borders where the Vines are only wanted to be "kept on their legs" and imthe Vines are only wanted to be "kept on their legs" and improved for a year or two to maintain the supply until young rods come into bearing; and that the best mode of establishing young Vines is, when the heating arrangements allow, to form narrow inside borders and plant at the time and in the manner

above described.

If it is desired to renovate Vines with a view to rely on them, and not to plant young canes, and if at the same time there must be no blank in the fruit supply, I still advocate the renewal of the border in summer or very early autumn before the leaves fall. But the work must be done with great care. There must be shading both of the Vines and roots during the process of removal, and the syringe must be freely employed to both; and when a crop must be had the following year one or two main roots of each Vine should be left intact, placing fresh soil round them, but not severing them until the following year, when new roots will have formed. The old roots (previously marked with sticks inserted in the border) can then be severed where desired without the Vines receiving any check to their growth. Where it is not of importance that Grapes be had the following season the whole of the roots may be raised and be shortened and pruned as desired, and the border be renewed as soon as possible after the fruit has been cut, or any time from the present date to the beginning of October.

In renovating old Vines it is always advisable to train up young growths, affording them all the light possible, and thus to prepare for the entire removal of the old rods with their scraggy and unsightly spurs .- A NORTHERN GARDENER

SUBTROPICALS.

FEW things in my opinion add more to the beauty of a garden than a judicious use of large-growing plants, such as are usually called subtropicals. Most of them are easily grown and give little trouble after they are once out, although, as a rule, they have voracious appetites, and will swallow any amount of the good things which are the venison and cream of the vegetable world. In fact, the rapid growth which they make must be supplied with liberal doses of liquid manure if the subtropical vegetation is to look healthy and luxuriant and unless it does so look there is no beauty in it.

When I first came here I found the margin of the lawn dotted with little round beds, each of which contained one standard Rose. Now the French say, "Chapten à son godt," and my own goût in this case is not to like standard Roses dotted about in little beds on the margin of a lawn. They look to me absurdly stiff and formal. I do not know what enthusiastic Rose-lovers would say to me, but I directed the factorum to clear them all away except two. They were really so beautiful that I could not make up my mind to destroy them, and there they stand still, though more than nine years have passed away. We turfed down all those little beds which were by the away. We turied down all those little beds which were by the side of the drive, but the others I allowed to remain, intending to fill them with specimen plants of the subtropical kind.

About the same time a clump of three Fir trees standing on slightly raised ground had to be taken down. The wind kindly took one, and then the others were obliged to follow. They were lanky sickly-looking trees, and I was glad to get rid of them though I missed them for a while. I think they were to the Fir tree world just what that poor creature must have been among his fellow men, to whom in the churchyard just over my wall his friends have placed this sad memorial

* Pain was my portion, Physick was my food; Groans were my devotion, Drugs did me no good."

Alas for the doctors! However, my trees were destroyed and made excellent firewood, and in their place I made a large bed for subtropicals. Knowing their fondness for high living I had a cartload of the richest material from the dung yard mixed with leaf mould and the old soil of the lawn before I put anything in. Then I placed a good clump of Pampas Grass in the centre, and surrounded it with Tritoma Uvaria. The following spring this bed was filled with Castor-oil Plants, Cannas, Dracæna terminalis, Tobacco, and Acacia lophantha. The bed was a great success the first year. The various colours and forms of the leaves harmonised well together, and the Tritomas sent up fine flaming red hot pokers round the Pampas. But all my pride in that bed has been taken out of me since, for I have seen Pampas and Tritomas together on a large scale in a beautiful valley in the New Forest which has

made my little effort look very small indeed.

Not far from Dibden on the Southampton Water may be seen growing in wild luxuriance in a narrow valley between two rounded hills glorious clumps of Pampas and Tritoma Uvaria, and growing so magnificently that the sight is one never to be forgotten. That is landscape gardening indeed, and really well done. The hill on one side is clothed with specimens of various Pines, on the other all is wild with rock

and Heather and Gorse.

But to return to my subtropical bed. After a year or two the Pampas had to be left in almost sole possession of the whole, surrounded only by a few Cannas and Verbena venosa and other smaller plants. The fiery pokers, too, can now scarcely find their way out through the drooping rough-edged leaves of the monopolising Pampas. However, it is beautiful in itself, and most useful in the waving silvery feather heads which it produces. With them both house and church are more or less decorated in the autumn. By the way, it is important in gathering Pampas flowers for decoration to take them before the feathery part has come out of the sheath in which it is folded at first. If this is not done it is probable that the flowers will be dull and brown instead of being, as they ought to be, bright and silvery.

With regard to the other beds, I have found them a very beautiful adjunct to the flower garden. They have been filled with various specimen plants alternated and changed as much as possible from year to year. In the shade under some magnificent Plane trees I have always found Dracena terminalis do well. It preserves its bright colour to late autumn, and generally makes fair growth during the hottest time of the year: it does not bear much sunshine. The Giant Hemp is a beautiful plant, so tall and graceful and light; it has stood all the storms of this stormy season, and seems none the worse after all, though while the wind is blowing it about it looks as if it must be destroyed. Probably the toughness of its fibre enables it to weather the storm. To bacco is too ragged to place by itself even in groups of three or four plants; it must be associated with other large-growing plants. The Bamboo is striking from its peculiar style of growth, and is one of the most excellent plants for a specimen; it is hardy, too, for last winter did it comparatively little injury. The various species of Ricinus are always chief aids to fall back upon, their immense leaves and glancous stems having a truly subtropical appearance. Last year I had the R. Gibsoni; its dark leaves were a lovely contrast to the green of the lawn and other plants near it. It ripened its seeds well. This year I have R. phillipinensis, and I am much pleased with its huge leaves and the oily green of their long fingers. Caladium esculentum is a great favourite, but it will not do alone. The enormous leaves are a great source of wonder to the good people of the village when they come to see my garden. The plants remain in their pots all the year. First they decorate the vinery, and then when the weather is warm enough they are placed in a group by the bow window of the dining-room, where they seem very happy and look very beautiful. In the late extraordinary gales the giant leaves nodded, and wriggled, and twisted about as if they did not much like it, but they are not much the worse after all.

The various forms of Cannas are most useful for my little beds. Some of them flower, and some with larger leaves have never shown any disposition to flower yet. I treat them much like Dahlias, storing up the roots in a cellar during the winter, and giving them a push in the early vinery in spring. There is something cool and refreshing about the soft green leaves of the Canna, as they gracefully unroll themselves to the summer heat. An Indian friend once exclaimed, "What! that nasty weed in your garden! I am sick of seeing it everywhere." "Well," I said, "I can hardly believe that I should ever get tired of seeing such a beautiful plant, even if it were a weed and a common one." As it is, I think the Canna comes in for more than its share of praise from visitors to the garden. I must not omit to mention the Banana (Muse ensete). I grew this from seed, and in two years it was a stately plant; it lived in the greenhouse during the winter, and was carried out in a tub which was sunk in the ground in June. By the side of it I placed a Seaforthia elegans, and I must say those two plants attracted more attention than anything else I possess. The leaves of the Banana were often 8 feet long, and I have been obliged to give up putting the plants out. The Banana grew too large for the factorum and a helper to carry in and out of the house. The Seaforthia showed strong signs of disapproving of the treatment. But for two seasons they were really lovely side by side in a small part of the garden which is very sheltered. The Banana is now in a lofty conservatory, but it threatens soon to want a house like the Palm house at Kew.—A GLOUGESTERSHIER PARSON.

DUPLICATE ROSES.

AFTER drawing the fire of two such great guns in the matter of Fisher Holmes and Duc de Wellington, my more prudent plan will be to retract. I quite see the differences so courte-ously pointed out; still I think they are almost too similar for exhibiting, and I border on the conclusion of the sorely perplexed African, "Pompey and Cassar berry much alike, especially Pompey." Fisher Holmes might often do for both. In respect of others that "WYLD SAVAGE" names, and especially of Mr. G. Paul's printed list, there can be no such hesitation; and I venture to think some reform of nomenclature one of the things that the National Rose Society may presently very profitably take up. If a list were given of names which, as duplicates, would not be recognised at any of their shows, and the presence of which would disqualify, this would no doubt be adopted by all affiliated societies, and a check would be given. The remarks of "D., Desl," on this subject (I suppose the judge of largest experience that we have) in a late number of the Journal are well worthy of notice; it ought to be an absolute rule at every show that every Rose is named (though

I would give facilities for finding out a lost name before the judging commenced), and then duplicates ought to be actually looked for, as is indeed a usual practice with judges.

Another point is the checking of old friends reappearing with a new name. It is a hardship to have to give a higher price for Marguerite Brassac and to find out, as we have been shown, that she is only Charles Lefebvre. The Beauty of Glasenwood business was a very fiagrant instance of this kind. Fortune's Yellow ought never to have allowed his name to be wrested from him as it has been. As regards the Cheshunt Roses, there is certainly a strong family resemblance in a certain strain. But it must be remembered this is rather a doubtful time of year for comparing; some Roses now will come so little like themselves that they are hardly to be recognised, and the same going off may make them run into others.—A. C.

FORCING STRAWBERRIES IN POTS.

FROM the remarks of your correspondent Mr. H. C. Ogle (page 180) I can only come to one of two conclusions—either that he is attempting to explain a system set forth by him some weeks ago, or that he is endeavouring to pull to pieces the article which appeared from my pen on the above subject. As Mr. Ogle's remarks on comparing his two articles seem very inconsistent I would like to ask him, What system of culture he really does pursue? It is very easy to see that he is unknowingly setting forth two different systems. In his first (page 464), after the final potting into the fruiting pots he says, "I again place them in cool frames, where they remain until required for forcing;" but in his second, "In winter the plants are placed in shallow cool frames on ashes with tar felting on framework in place of lights." In the one case, then, the plants are placed after the final potting in cool frames, in the other they are only placed in them for protection during winter.

Again, we find Mr. Ogle placing the pots in saucers of water in order to save watering, as he explains in his first article; and in a letter six weeks later they are placed in saucers, because "the Strawberry is of strong growth and subject to red spider." Having some doubt about the accuracy of his first statement he further says, "It is for the purpose of preventing drip," which appears to be his principal reason for the use of saucers. I wish to know if Strawberry pots standing in water will keep red spider in check. My experience is that Strawberries too frequently become a prey to red spider, either through neglect or through the plants being starved at some time. If the plants are grown rapidly under favourable conditions without check there is little fear of that insect troubling them; but should spider exist on the plants when stored in the winter they invariably are a source of annoyance in the spring, and I believe no saucers of water will eradicate them.

While your correspondent admits he would be glad to hear of any improvement in the way of culture, he appears slow in embracing the system already advanced in the Journal of layering runners into the fruiting pots. This system has a decided advantage over the one recommended at page 464 of the last, and again at page 130 of the present volume. I will just examine the two modes. First the runners are taken off, rooted in a close frame, and then finally potted. This plan not only draws the young plants up weakly, but in adopting it great risk is run of damaging the crowns in the hurry of potting them by those charged to carry out the operation. As to our method, I will ask Mr. Ogle if the work of potting the plants from small pots into fruiting pots does not take twice as long as filling the fruiting pots in the first place and layering the runners? Further, must not the young plants make greater progress when assisted by the parent plant than when severed and subjected to unnatural treatment? Moreover, when layered into fruiting pots the plants receive no check afterwards, which they are bound to do to a greater or smaller into larger pots. Supposing from two thousand to four thousand plants are forced, there is that number of small pots to be washed in which to place the runners, and then they have to be changed to larger pots. None of this is necessary with the other system. Besides the large amount of labour saved there is no comparison between the plants grown under one system and the other. In the one the plants are weak and puny, as a visit to our garden will abundantly prove, while in the other they are robust and full of vigour.

It would be well for Mr. Ogle to carefully peruse my remarks

on page 1, for then perhaps he will clearly see that there is no allusion to the stacking system in winter. Strawberries need no protection in winter when plunged outside in leaf soil or coal ashes, except in the case of plants required for very early forcing. Taking for granted that the system of layering in fruiting pots is thirty years old, and that the one advanced by Mr. Ogle is of more recent date, I still say without hesitation that the newer mode of culture is a step in the wrong direction. -WM. BARDNEY, Norris Green.

WINTER SPINACH.

This is one of the most useful and perhaps one of the most sappointing crops in the garden. The seed usually germidisappointing crops in the garden. The seed usually germinates freely, and the plants grow well enough for a time, and then one by one canker and die until the bed is spoiled. One reason why the plants "go off" is that the soil is too rich, producing a very succulent growth, which speedily succumbs to the influences of adverse weather. I have often found it advantageous to sow on firm ground—that is, ground that he not been dug after a preceding crop, say of winter Onions. In low-lying and wet positions it is worth while forming the ground into a series of ridges about 18 inches apart, sowing a row on the top of each ridge; but the best place of all for winter Spinach is an ordinary field. In such an exposed position I have never found it fail, which suggests that when grown in gardens, as in nearly all cases it must be, moderately fertile soil and an open site are essentials to success. It is very important also that the plants be thinned out freely, not after they become crowded, but before they touch each other; they then assume a sturdy hardy character, enabling them to pass the winter with comparative safety. The winter or prickly-seeded Spinach is more hardy than the round-seeded or what is termed summer Spinach, at least so say all the books, and catalogue writers who copy from books; but I for one dissent from such teaching. I have sown both varieties side by side for nearly twenty times during as many consecutive Augusts, and not in one instance has the "winter" proved more hardy than the "summer" variety. More often the reverse has been the case, and I would quite as soon rely on the round-seeded variety sown now for yielding a supply of leaves early next spring as the prickly-seeded sort. I think Mr. William Taylor has written to the same effect; but although he flatters me by describing my writings as provokingly like his own, I have certainly not copied his practice in growing Spinach, for I proved what I have said as to the relative hardiness of the two varieties long before he enriched the pages of the Journal with the records of his experience, and long also, I may say, before I was seized with a scribbling fit, which occasionally impels me to narrate my own views and practice. I perceive, however, that at last I have placed myself in opposition to Mr. Taylor. As calmly as possible I await the coming impeachment.—A NORTHERN GARDENER.

MAIDENHEAD HORTICULTURAL SOCIETY.

AUGUST 14TH.

THE second annual Exhibition of this Society was held on the above date, the day being all that could be desired. A very good show of plants, flowers, and fruit was staged; and worthy of special notice was a collection of stove plants from the Duke of Westminster's gardene, Oliveden. In this collection Ortons and Ferns were very fine, one Adiantum farleyense being 3 feet through. Next came Mr. C. Turner's collection of Liliums, Roses, Carnations, and Picotees. It is well known where Mr. Turner exhibits there is something good to be seen. The Roses, Carnations, and Picotees were beautiful. Six boxes of Roses were staged containing seventy-two blooms each, and all were excellent both for size and quality. These, the Carnations and Picotees, were the chief attraction amongst the flowers.

attraction amongst the flowers.

The following were the awards in the principal classes: For six variegated or handsome-foliaged plants Mr. G. Elliott, gardener to J. Hibbert, Esq., was first. For six stove Ferns Mr. J. Tomlin, gardener to Miss Patterson, was first. For one specimen plant Mr. J. Hibbert again carried off the honours. For a group of plants to compy a space of 12 feet by 10, Mr. Maher, gardener to C. Allhusen, Bsq., Stoke Court, was first; J. Hibbert, Esq., second; and Mr. Elliott, florist, third. In the class for Fuchsias first honours went to Mr. H. E. Gribble, gardener to H. Palmer, Rsq. Eight classes were provided for cut flowers, and most were well contested. FRUIT.—In the class for six dishes of distinct kinds C. Allhusen, Esq., was first; second Mr. A. G. Bridgman, gardener to J. B. Cocks, Esq. In the class for Black Hamburgh Grapes first honours were obtained by Miss Patterson; second, J. W. Burrows, Esq.; third, Mr. W. Mowbray, gardener to the Earl of Leven and Mel-

ville. In the class for Muscat of Alexandria Grapes the Rarl of Leven was first, Miss Patterson second, Mr. G. Reve third. In the class for Peaches J. S. Cockle, Esq., was first; Miss Patterson second; C. Allhusen, Esq., third. Nectarines.—E. H. Palmer, Esq., first; C. Allhusen, Esq., second; Miss Patterson third. Apples were shown, but inferior both in size and quality. Melans also were very inferior. With the exceptions named the fruit generally was very good.

generally was very good.

Vegetables were well represented, and taking the season into consideration they were good, particularly in the collections for

aine dishes.

A division was provided for anatours only, and some very good plants, cut flowers, fruits, and vegetables were shown. The cottagers' classes were well filled with good vegetables, and substantial prizes were offered to the cottagers for their products. Special prizes were offered by Mr. Broughton, Mr. Bliott, and Mr. Fernic of Maidenhead, also by Messrs. Sutton & Sons, Resding, to cottagers for vegetables; these brought strong competition, and all classes were well contested. Mr. Standish staged a collection of plants not for obspeciation. Most conspicuous and good were the American Tuberpasses. the American Tuberoess.

On the whole the Show was a very good one and we think must be a decided success, as the large hall was crowded with people from the opening to the close of the Exhibition. Great credit is due to the Committee under whose management so much has been

A FLOWERY LAND.

DURING a season like the present, when the general aspect of field and garden is comparatively colourless by an overwhelming preponderance of foliage and a corresponding paneity of flowers, the above term as applied to the majority of gardens would be a misnomer, but it is certainly not so when employed in reference to a bright spot on the Essex coast—namely, the seed farm of Messrs. James Carter & Ca. at St. Osyth. The firm in question-is-far too enterprising to permit its works, ipossessions, and resources to remain in obscurity; but no one who has seen the farm under notice during the present: month em. access the proprietors of overestimating its importance as exemplifying the magnitude of the flower seed industry, nor of unduly extolling the striking beauty it presents when seen under the advantages of a sunny day. The gently undulated graund-far simust as the eye an reach is one grand figual passwans—as my every colour being represented in clean bold masses, varying from a few rods to an acre or more each. In one field the flowers are grown in comparatively small squares of a few poles in extent, the colours being arranged with a view to effect, the whole re-sembling a piece of mosaic work of considerable magnitude and great brilliancy. In another they are grown in larger masses, clearly defined stripes of colour from 5 to 10 yards wide and several chains long. In another the groups are more rregular—blue, white, yellow, arimson, pink, buff, and inded almost every conceivable colour being rappearated, and all full, fresh, and level to the extent of quite sixty acres, and forming what is a perfectly justifiable designation—"A Flowery

Let us look a little more closely at the several parts composing this rich and varied pleture. No one who has not seen, for instance, an sure of the orange Eschecholtzia can imagine its brightness, nor the rich fiery glow of a mass of the erange-scarlet variety Mandarin, nor the density of colour of the double yellow. Besides these there are in smaller masses a distinct rose-coloured variety, and even a choice patch of a semi-double white form of this popular annual. In fine con-trast are some seres of the charming sky-blue Nemophila insignis, and a considerable extent of its variety marginat, the petals being margined with white. Still deeper in colour are the rich breadths of such Lobelias as the true specioss and Cobalt Blue, and the paler yet still attractive Paxtoni. Of more dazzling hues are the dwarf Trapsolums; the intense velvety marcon of King Theodore, the distinct Ruby King, the soft buff of Crystal Palace Gem, the chining yellow of Golden Tom Thumb, and the glowing scarlet of King of Tom Thumbs with its dark bluish-green foliage. This is the best of all the scarlet varieties grown en masse, but a variety selected from it is decidedly richer in colour, which as yet is only seen in a very small quantity. Some new varieties which have been selected and "fixed" by Messes. Carters' foreman command attention by their novel colours. Spetted Queen, golden yellow spotted with scarlet erhason, is totally distinct from Spotted King, which is blotched with thosolate; The Frince is pale primrose with clear chocolate spots, very distinct; Chameleon is buff spotted and margined with rosy crimson; and The

Bride is a soft pleasing yellow faintly spetted and flaked with purplish crimson. These novelties are very attractive and quite dissimilar from all others of this useful genus of free-

growing yet dwarf and effective annuals.

Less glowing than the Troppollune, but not less attractive. are the extremely chaste and very pleasing masses of Rhodanthes maculata, Manglesii alba, exc.; also an effective double-flowered variety. The Charkies in large squares present an extremely cheerful appearance, especially C. integripetala limbata, every petal of which is clearly banded with white, the plants growing about a foot high, and the entire bed as level as if all the plants had been the produce of one pod of seed. A newer variety with a darker centre has been selected, which is regarded as an acquisition. The double white variety is a mass of purity, and tells well amongst the deeper colours. Not many squares have a more gay and, beautiful appearance than those devoted to dwarf Larkspurs—the Stock-flowered, Bocket, and Hyacinth-flowered; each in upwards of a desen distinct colours, the plants being as regular in size as if they had been cast in a mould. Of a richer order of beauty is a gorgeom breadth of Godetia Lady Albernarie. This fine variety is somewhat sportive in its character, and it can only be kept true by rigid selection. Every plant having the slightest tendency to overtop its neighbours must be removed before flowering, or the seed will not be reliable. In this large bed of many susand: plants not one-can be seen differing from the rest either in-habit of growth or coleur of flowers, but the whole presents a level magnificent glow of lively orimon. Equal to that variety in coloar is G. Whitney: flammes. The plant is apparently of rather more stardy habit than the foregoing and flowers somewhat later, and the large bed of it is very grand. G. Whitneyi is very fine, and there are other colours of this gay genus, including a pure white form, the various masses being singularly striking. Another rich and distinctly beautiful quarter is Vicearia cardinalis. This variety, which is by far the finest of them all, originated at St. Osyth some years ago, and special care is taken to keep it pure, the seed for such the second care is taken to keep it pure, the second for such their several colours (shining crimson scarlet), or the variety deteriorates. When seen true as it is "at home" it is one of the most beautiful annuals in cultivation.

Of annuals of larger growth grown by the acre are Sweet Pess in separate colours. The harvest of these, it is feared, will not be a good one, the plants being scarcely in full flower, and the seed can hardly be expected to ripen in the usual manner. In appearance the masses are very beautiful, and the perfume is waited by the breeze to a long distance, and as mingled with that from an acre or two of Sweet Alyssum and patches of Sweet-Sultan in various colours the odour is powerful and peculiarly refreshing. Not sweet but remarkably striking are the squares of Chrysanthemums—the double white variety Dunnetti, full and pure; and the double golden with large Aster-like flowers. Antirririaums also command attention as grown in separate coloure and in mixture, the crimeon and white beds, "self beds," being particularly noticeable. The bed of fine dark Emperer Larkspur is very rich.

Of annuals of dwarfer habit which command attention by the rich carpet-like surface produced by them are such Campanulas as Lorei and the bright Venus's Looking-glass; and for panels of pink nothing can surpass the pretty Sapenaria calabrica and the frae spring bedder Silene pendula compacta. The white Saponaria pumila alba is also very charming; and equally so are the Leptociphons densifierus, which has grown taller than usual this year; roseus, dwarf and extremely pretty; and lutens, sparkling with its thousands of tiny golden flowers. Candybufts in various colours are largely grown, but the quarters have been somewhat injured by the wet. Collinsias produce a charming effect, and especially so does Lupinus nanus, which is extremely rich when grown by the rood. Nolana paradoxa, the Sphenogynes; Kanifussias, Bartonias, very dwarf and very double French Marigolds, and many other flowers which share in the filling-in of this great floral picture. Many annuals have necessarily been omitted mention, but one tiny gern must not be forgotten—namely, Nycterinia selagineides, which is highly worthy of cultivation both in pots and small beds. A spleadht bed of Sweet Williams, too, demands notice. The varieties are of great excellence; the flowers large, flat, and circular, and the colours defined with creat cleaves. great clearness—a fine selection. Pansies, too, are extremely gay, at least the famey varieties are, while the one named Beauty of St. Osyth is about as black as a chimney-sweep's hat. In fine contrast is a bed near it of the dwarf, floriferous I variety, but it is not so fine as one now on the plant, but is a

and extremely brilliant Mimulus cupreus—a splendid plant for pots and moist but not overshaded borders. The appearance presented by the large masses of the flowers named and of many others that must be passed in silence is at once splendid and imposing. Every variety is selected with great care, and out of the countless thousands of plants grown scarcely a "rogue" can be seen.

Only a few acres of the St. Osyth seed farm are devoted to vegetables (which are grown on other farms), and incomparably the most striking of all the vegetables now to be seen is the new dwarf Pea Stratagem. Of the rows of this Pea one or two supported by short sticks, and the others growing in a square without any such assistance, it is impossible to speak too highly. The haulm is nearly 2 feet in height and very strong; and grand peds are produced from the very ground to the tips; so low down indeed are they and so fine that their points rest on the soil. The pods are as large as these of Telegraph grown in the same field, and are equally full, which is saying a great deal, and the Peas are also of the first suse, sweet and juicy. On trenched and well-enriched ground this new dwarf Pea cannot fail to give great satisfaction, while if grown in manured trenches and the haulm supported by a faw sticks grand rows must follow. On thin, dry, and comparatively poor soil dwarf Peas are often disappointing. They require soil in "goed heart." and are then valuable both for home consumption and market purposes. This is the finest of all dwarf Peas, and the nearest to it is another variety of the same character named Strongth. This may be a little dwarfer than the other and the pede a trifle broader and a shade desper in colour, but generally there is a similarity between the two; still, as they were not growing in the same quarter they could

not be properly compared.

We now come to Telegraph and Telephone. These are growing side by side, and in appearance are very nearly identical. The latter was simply selected from the former, the wrinkled seeds being separated from the round, and after being tried at Chiswick the wrinkled form was awarded a first-class certi-It is decidedly premature to judge of the relative merits of the two Peas, or to indulge in any dogmatic assertions ments of the two reas, or to mange in any augment access relative to either of them, until it has been proved that Telephone does not preduce wrinkled seeds. If it yields both smooth and wrinkled seeds the same as Telegraph the question is settled as to their identity. Wrinkled Pees are generally of better quality than round, and quality is hardly an unim-portant point. If it were, and if the fact of a Pea being wrinkled were not sufficient to constitute it a variety, we should have no Champion of England Pea now. The history of this good old standard variety is known to many, but has been forgotten perhaps by some. An early-blooming plant of Knight's Dwarf Marrew was selected for seed. One of the pods produced by this plant contained both smooth and wrinkled Peas. These were sown; and the relative characters of the seed being maintained, the round variety became Fairbeard's Surprise, and the wrinkled one Champion of England. Sup-pose the same distinctive points should be "fixed" in refer-ence to the two Peas Telegraph and Telephone, will not that be sufficient to constitute them separate varieties? Judgment on Peas by merely seeing them growing can be of little or ne weight; therefore until the varieties have been fairly tested in a cooked state, and until it is seen in what form the seed ripens, it will only be prudent and fair to withhold the expres-

sion of a definite opinion in regard to their identity. On the same farm some selected stocks of Wheat, Carter's Fill-measure, and a horned variety, are remarkable for their fine heads, in this respect greatly excelling the ordinary varieties of Wheat in general cultivation. The entire grounds are, considering the season, remarkably clean. The soil being light and well drained has enabled weeds being destroyed more easily than has been the case on the majority of soils, and this advantage has certainly been turned to account, for scarcely any weeds are visible in this excellently managed and highly attractive farm, which is situated about fourteen miles from the Manningtree station of the Great Eastern Railway, and about three miles from the sea.—VISITOR.

Since our correspondent's notes relative to Telegraph and Telephone Peas were written the varieties have been "fairly tested in a cooked state," by the Fruit Committee of the Royal Horticultural Society, and have been found distinct.—EDS.]

GLOTRE DE NAMCY BEGONIA .-- I send you a flower of this

POTTEN, Sissinghurst.

[The flower exceeds 2 inches in diameter, is perfectly double. and very fine.-EDS.]

PARAFFIN AS AN INSECT KILLER.

FURTHER experiments on a large scale have fully convinced THERE experiments on a large scale have fully convinced me that this is the best and safest antidote for red spider and scale with which I am acquainted. Thrips and fly are not so readily destroyed by it, but these it is well known are easily destroyed indoors by fumigation. The quantity of paraffin which I find safe as well as effectual is 1\frac{1}{2} oz. in weight to a gallon of water, and this if used unsparingly in the way which has been so often described in this Journal—viz., putting a swinceful into the retained on to the plant elementally will syringeful into the pot and on to the plant alternately, will with two or three doses cure the worst cases of scale or red spider in existence. I have no doubt from what I have heard that it is equally effectual for mealy bug, and I would recommend those who have this troublesome pest even in their bunches of Grapes to try it; for although happily I have no chance to prove its efficacy in this respect, I have proved its efficacy as well as its harmlessness on other very tender plants, some of which I will name before I conclude these notes.

No doubt we shall have, as before, many of your readers rushing to the rescue and telling us in pitcous tones how they have had their plants killed outright by using paraffin, and seriously warning us that even the odour is injurious to plant life. I give these good friends all credit for honesty of purpose and for faithfully recording their convictions; but we always find when examining their details that they have not carried out the instructions given, or they attribute their failure to the wrong cause.

wrong cause.

We read of trees being killed by painting in winter with undiluted paraffin, or of plants being seriously injured by dipping in a very strong mixture of it. Results cannot be otherwise. The abuse of a thing does not prove its worthlessness, and we know it is sometimes possible to have too much even of a good thing. But, on the other hand, if the recommendations of anyone of your responsible contributors are faithfully carried out and failure then follows, it is very important that the operator should give all details with the strictest accuracy. the operator should give all details with the strictest accuracy, so that any error in the instructions may be detected and the failure ascribed to the right cause.

A very necessary precaution which I omitted to mention in a previous paper is to prevent the sun touching any plant which has been syringed with paraffin before it gets perfectly This will sometimes take a whole day, or even two days, for the oily substance sticks to some leaves a long time, and as far as my experience goes it cannot easily be removed except by evaporation. We have tried to syringe it off with clear water; we have also tried soapy water both hot and cold, and water with soda dissolved in it, but none of these are very effectual so long as they are used at a strength which

We have tried several plans to make the paraffin mix with the water, such as making the water hot, using soda or soft soap with it or both, but it is always the same—the oil comes to the top, although there is certainly something in the paraffin which always mixes with the water, for it changes the colour of it. I have used it at the strength above named for Peach trees immediately the flowers were set, and again on other trees after the second swelling had commenced. I have used it for yearling pot Vines while the growth was very tender, and for Stephanotis with hundreds of fully expanded flowers on it. Once only a few of the Peach leaves had holes burned in them as large as a small pea, and this was owing to the sun reaching them before they were dry. In no case where the precautions I have named were taken was there the least injury to leaf, fruit, or flower, while the cure was perfect. WILLIAM TAYLOR.

CLETHRA ARBOREA.

I WAS much pleased to see your remarks and illustration of this plant at page 130, as on account of its fine flowers it is well worth the attention of your numerous readers. The description of it is quite correct, but you have under-estimated its height, "8 or 9 feet." There is a large plant of it growing

fair average size. I consider this one of the most useful varieties we have. The plant has been loaded with blossoms for some months and will be for some months to come.—WILLIAM is very attractive. I believe it would stand out of doors very well in ordinary winters, as although we place our plants of it in the Orange house during the winter, they were frequently subjected to 10° of frost in this structure last winter without the slightest injury .- J. MUIR.

ABOUT LIVERPOOL.—No. 1.

FROM the report of the Show of the Liverpool Horticultural Association published in a recent issue of the Journal it will be gathered that there are good cultivators in the vicinity of the famous port. The gardeners "about Liverpool" appear to be earnest men, as undoubtedly they are able-over-zealous some of them (I employ the plural advisedly) were on one memorable occasion, and they possess what may be termed a good share of local patriotism, yet notwithstanding they are, as a body, worthy representatives of "the craft," and their works are worthy of record. Before, however, noticing a few private gardens to which a flying visit was paid, it may be well to refer bright to the public condens and refer to the condens and the public con well to refer briefly to the public gardens and parks, commencing with the BOTANIC GARDEN.

My visit to this garden and to the principal parks was rendered especially agreeable from the fact that my guide was "no novice," but, on the contrary, was a hale octogenarian—a hearty, active, genuine old gardener aged eighty-six—so active that he walks two miles to church every Sunday, and would walk the same distance any day to see a good crop of Grapes, of which fruit he was once a successful cultivator, as the gold medals in his possession testify. "Old Shaw" is a wonder in his way, and appears to be a general favourite. He demonstates in a very matter-of-fact manner that the district "about Liverpool" is not unhealthy, and that the vocation of garden-ing has not proved hurtful to his constitution, for his health is apparently as good, his eyes are as clear, his ears as acute, and his perceptions are as quick as ever. He is further, as he deserves to be-for he has been industrious and prudent-in a very well-to-do position, and nothing pleases him better than to place his carriage at the disposal of a friend, whom he will drive safely during a gardening tour and meet with a ready welcome wherever he calls.

Our first call—passing through Newsham Park—was at the garden under notice. The Curator Mr. Richardson, who is also the chief Superintendent of the parks belonging to the Corporation, was absent. The garden, which is open to the public, has a somewhat venerable appearance. It is a walled enclosure, and contains an extensive collection of hardy herbaccous plants which appear to be properly named and cherished. Of these plants there are several borders by the sides of the principal walks which traverse the enclosure. There are also lawns and flower beds. The design of one of the flower gardens is especially quaint. Between the beds on the lawn are sunken grass paths about 2 feet wide and nearly as much deep. It is a singular arrangement, and the flowers are certainly brought nearer the eye than by the ordinary mode of forming beds on lawns. It is not, however, likely that the plan will be extensively according to the control of the control sively copied, as it is not particularly attractive; but it would be very undesirable to alter it, for it is quite in harmony with the old place and is a distinct and novel feature of the garden. On another lawn the beds are not of the ordinary type, but are very narrow, forming a long, curving, graceful scroll, which when well filled with flowers have an elegant appearance. This year the plants have not grown with their usual freedom owing to the extreme inclemency of the season. There are also other lawns and beds of more modern design, also banks of flowers and a few carpet beds. There appears to be a fair collection of shrubs, but they do not look so fresh as young trees in country gardens.

The principal glass range is extensive, but at the time of my visit the houses were en deskabille, as they were being painted inside. Large Palms were tied up, and the plants generally were huddled together as is usual under such circumstances. The Palms are very fine, as also are many of the Tree Ferns, and there appears to be a good collection of plants generally. There are useful ranges of preparing houses—the best part of the garden as I was informed, but for the reason above stated we did not explore them. On meeting Mr. Richardson subsequently he much regretted this; but I was unable to accept his cordial invitation to pay a second visit to the gardens, which are evidently under very efficient management and

appear to be enjoyed by the public, for the visitors appeared numerous and appreciative.

PRINCE'S PARK

was our next rendezvous, and we were fortunate in finding Mr. Mason the able manager at home. This park is private property. It is fifty acres in extent, forty of which are enjoyed by the public, the remaining ten acres being more gardenesque in character. This enclosed portion is reserved for the occupiers of the contiguous mansions, the ground rents of which deray the cost of keeping the whole fifty acres. The private portion was laid out with great taste by the late Sir Joseph Paxton, and contains many beautiful features. The walks and nised borders of trees and shrubs have been so disposed as to make the enclosure appear much larger than it really is. The water with island and rocks, and the flower gardens in suitable positions, viewed in connection with the fine trees contiguous render this portion of the park very ornamental and agreeable. In the flower gardens, which are not large, the whole of the beds are edged alike, their margins being finished with Echeveria secunda glauca, which Mr. Mason finds renders the arrangement more uniform and satisfactory than when various plants are employed for edging beds in small geometrical groups. The ordinary kinds of flower garden plants are employed, but such plants as Alternantheras have almost succumbed to the excessive cold and wet weather. A golden carpet and edging plant not often largely employed thrives well in Prince's Park—namely, Lysimachia nummularia aurea, which forms a surface of bright gold and is very plessing. The ornamental grounds were extremely clean and nest, and the pretty and well-managed enclosure was highly enjoyable.

SEFTON PARK.

This is not only the most extensive, important, and attractive of all the parks of Liverpool, but is amongst the most cramental of its kind to be found in the kingdom. It is comparatively new, only having been completed some seven or eight years, but the trees and shrubs have grown remarkably well, and considerable judgment will now need to be exercised in their thinning, so that the most suitable trees can develope satisfactorily and display their forms to advantage.

The park is about three hundred acres in extent, and was laid out with great taste by Messrs. André of Paris, and Hornblower of Liverpool. What strikes the visitor on inspecting this park is the absence of harshness and tedious intricacy of design. The artists took a wide scope of their subject, and executed their work with boldness, smoothness, and freedom. The natural hollows appear to have been deepened and the higher points raised where needed; thus the valleys appear as if Nature had formed them, and the elevations as if they had been there for ages.

In the lower portion of the park is a winding stream about a mile in length, its head being a bold cavernous example of rockwork, from which the water will issue when this part of the work is completed. The stream widens gently as the distance increases from its source until it expands into a small lake, enjoyed in winter by the splendid skating it affords, and in summer for miniature yachting. Here and there islands are formed with jutting rocks at wide intervals, and smooth swelling lawns and mounds of shrubs alternate on its margin, rising and receding in the most natural and picturesque manner. Walks converge at various points, and at those points the scenery is extremely attractive.

The roads are splendid—broad, hard, smooth, well drained, and clean. A very wide drive encircles the park, and others less wide but not less firm dissect it at intervals, forming elegant sweeps for carriages; there is also ample and suitable provision for equestrians.

The trees and shrubs are generally disposed in groups of the same kind rather than dotted in a too conventional manner "all over the place." Flowering trees such as Thorns, and deciduous shrubs such as Weigelas, have been freely planted, and are thriving admirably. The roads, walks, borders, and grass edgings are surprisingly clean considering the season. The Corporation of the town are erecting handsome and convenient lodges for officials and the public, and commodious shelters are formed for visitors in inclement weather—indeed everything appears to be done by the Parks Committee to add to the enjoyment of this splendid place of resort, and they are fortunate in having a manager of taste, ability, and good judgment, for it is abundantly evident that Mr. Herbert possesses these qualifications, or it would not have been pos-

sible for him to have maintained such excellent order as prevails during a season like the present with the staff of men thirty-five I think—at his disposal.

Flowers are few as yet; but eventually it is expected that provision will be made for more, when some suitable spot will doubtless be found for a flower garden, and thus an additional feature will be provided which the public, as is instanced by the London parks, cannot fail to appreciate, while the pure and true park-like character of the estate will be maintained. Sefton Park is a grand provision for the inhabitants of the town, and contributes in an important manner to their health, recreation, and enjoyment. The other parks of Liverpool—Stanley Shield and Wavertree Parks—although they answer their purpose well and are largely patronised, do not call for special comment.—J. W.

STRAWBERRIES FOR PRESERVING—NEWTON'S SEEDLING—GROVE END SCARLET.

MR. PEACH in his interesting notes on Strawberries on page 125 mentions among others Newton's Seedling, which he recommends for preserving. If this is the same as a variety I once grew under the name of Newtown Seedling I can confirm all that Mr. Peach has said in its favour. The variety to which I allude has rather small foliage and small, dark, wirylooking flower stems, the fruit being medium-sized, conical, dark in colour, and very firm, with a sharp sub-acid flavour. It is one of the most prolific Strawberries in cultivation, is the best traveller that I am acquainted with, and is less injured by wet weather than most other varieties. It makes firm and not over-sweet jam, and is highly worthy of cultivation for preserving purposes, but is not good enough for dessert. It thrives in poorer soil than many other Strawberries, and is altogether a very useful variety. I only know one other Strawberry to surpass it for preserving, and that is the other variety mentioned above.

Grove End Scarlet makes firm jam of a colour that is much coveted. In several large establishments this old variety is the only Strawberry that will be accepted by the cook for preserving. It does not yield half the weight of fruit plant for plant as Newtown (or what is more probably correct), Newton's Seedling does, but is yet fairly prolific. A convenient mode of cultivating this Strawberry is to plant strong runners about 9 inches apart, leaving out every fourth row for an alley, allowing the others to grow in a mass. The Strawberries are then in beds and can be conveniently gathered. When thus cultivated the fruit is kept clean, as the foliage being thick and the Strawberries not heavy they do not rest on the ground, and blackbirds do not find them so readily as when the fruit is exposed. In many gardens the foliage is cut off the beds with a scythe after the fruit has been gathered, and a top-dressing of loam and soot or some other fertiliser is spread on the beds. Some cultivators call that a barbarous practice, but it nevertheless has the merit of answering well as applied to the Strawberry in question. When grown thickly and the foliage is left on the plants light and air are excluded from the crowns, which consequently become weak and the crops are impaired.—An Old Grower.

ROSE SOUVENIR DE LA MALMAISON.

M. BELUZE, sen., Rose-grower at Lyons, sowed in the year 1840 a number of seeds which produced the magnificent Rose under consideration. Two years later the raiser was in a position to affirm that something very exceptional had come to light, although at that time he had but one flower, and that one the solitary shoot of the parent plant itself only 13 inches high. This acquisition was brought under the cognisance of the distinguished rosarian M. Plantier, who at once pronounced it to be the best introduction of the times. The flower is distinguished by its rare perfection of form and colouring, yet the first flower was but little over an inch in diameter; but when buds were inserted on strong Bengal stocks the result was natural-sized flowers averaging 3 inches in diameter. That was in the year 1843, the year it was sent out. The most important question, however, was to determine of which variety the seeds which produced this flower were saved. After several delays the Horticultural Society of the Rhone convened several meetings to take this matter into consideration, and ultimately came to the following conclusion: That as seeds of Roses are, except in rare instances, not sown as so many different varieties, it follows that each pan contained the seed of one class

It is therefore not quite certain, though extremely probable, that Souvenir de la Malmaison is the offspring of the Bourbon Rose Madame Desprez; and that is the opinion of the reiser

himself, further strengthened by M. Plantier.

If this assertion requires further proof it will be found in the fact that nearly all the seeds gathered and sown came from Madame Despres, and it will be found upon caseful examina-tion that there is a great similarity of habit and foliage between the two varieties. The Bourbon Roses Jaquard, Cendres de Mapoleon, Etolie du Berger, raised previous to Souveair de la Malmaison, are all the offspring of Madame Despres. The parent plant of Souvenir de la Malmaison still existe at Lyons, where it continues to flourish in spite of being out dewn for propagation and growing in a position not at all favourable to it—that is, facing the south. Still growing against the wall where it was first planted out in 1841, this knotty old lady, whose children are to-day distributed throughout the world, still blooms very abundantly, notwithstanding that she had to endure the hardest winters and such severe gales that everything was swept away except one or two eyes at the base.

Souvenir de la Malmaison, with its great massive flowers, white slightly diffused with flesh colour, of admirable form, will always retain the exclusive privilege of being a gem of the very first water, esteemed and sought after by the lovers of Roses of all nations, who continue to find in this remarkable variety a full supply of suitable Roses which help to enrich the choicest bouquets at all seasons (Journal des Roses.)

CARTER'S TELEPHONE VERSUS CULVERWELL'S TELEGRAPH PRAS.

As the characters of these Peas are at present being brought before the public, and when the Fruit Committee of the Royal Horticultural Society has now confirmed the certificate granted to Telephone last year, let me say I consider this very rightly done, and at the same time I can fully confirm all that "TEUTH" has said on the matter in last week's Journal. In coming to his remarks I was rather curious to knew how the difference between these two Peas was to be explained, and the details correspond in every particular with the notes and observations I have been making here during the present season. Most of the Peas here are growing in long rows, one variety following after another in the same row; and in this way we have Telephone and Telegraph growing in upwards of a dozen rows, and in every instance the different characters which "TRUTH" points out are clearly visible. As the season advances I may send you more notes on these and other varieties of Peas, as during this and last season we have grown upwards of thirty sorts, and are now beginning to find out their merits and those which suit us best. Many of them will not be grown here again. I may say Carter's Telephone and Carter's Challenger stand very high in my estimation.— J. MUIR, Margam Park.

I HEREWITH enclose samples of Carter's Telephone Pea and Culverwell's Telegraph. I confirm everything that "TRUTH" said on the subject in the last issue of the Journal. The Pess I consider as distinct as any two varieties in cultivation. Please say what you think of the samples I have sent.—Thomas EADS, Gardener to John Becke, Esq., The Cedars, Northampton.

[We have not seen finer pods this year; some of them exceed 54 inches in length, and every pod we opened contained nine large peas. Telephone is quite as large as Telegraph. The varieties are unquestionably distinct.—Ens.]

NOTES AND GLEANINGS.

WE have received the following relative to the CETSTAL PALACE AUTUMN SHOW :- "In consequence of representations that have been made by several of the leading nurserymen and others, that owing to the badness of the season there is no reasonable hope that even a respectable exhibition of cut flowers can be made this autumn, the Directors have determined to withdraw the proposed Exhibition of cut flowers. The Fruit Show will take place on Thursday, Friday, and Saturday, August 28th, 29th, and 30th, as announced; but the Exhibition of flowers will not take place, and no entries will therefore be received for the proposed Exhibition." We are glad to observe that third prizes are provided in the classes for collections of fruit, and were a portion of the amounts apportioned in the cut flower classes devoted to providing third prizes in

the remaining fruit classes better competition and a larger show would be insured. We regret to see that no prizes are provided for collections of vegetables, which have often been so fine at the Palace, and certainly a great attraction to visitors. Instead of the vegetables a Cucumber Show is attempted, classes being provided for White Spine, Black Spine, and smooth Cacumbers respectively.

—— A FLEASING and novel example of CARPET BEDDING recently attracted our attention at Windsor, which deserves

notice from its simplicity and effectiveness. On the extremely steep grass slopes at the base of the round tower of the Castle are several large circular beds, each of which is divided into four sections that radiate spirally from the centre. These sections are planted alternately with a dwarf uncommonly darkfoliaged variety of the common Beet and the Golden Fever-few, afferding a striking yet beautiful contrast when viewed either from the battlements or the read leading to the tower. There are also smaller beds which contain ordinary beddi plants, such as Lobelias, Pelargoniums, and Calcolarias, that considerably add to the bright and lively appearance of the slopes. One bed was raised in the form of a mound about 8 or 4 feet in height. This was carpeted with feelum hispanicum glaucum, several good plants of Mcheveria metallics and fempervivums being scattered over the surface. In another po-tion of the Castle we observed a small countyard most agreeably enlivened by a ribbon border that was planted with the peculiar but pretty Lobelin Omen and Calesolarias; the light peculiar out presty Loudsen values and purple or pure colour yellow of the latter and the pale reddish purple or pure colour of the former harmonised very pleasingly. The condition in yellow of the latter and the pure passingly. The condition in of the former harmonised very pleasingly. The condition in which the whole of the Castle grands are maintained is highly which the whole of the Castle grands are maintained in highly commendable, for good order and meatness everywhere pre-

- In the Temperate house at Kew the handsome eres-In the Temperate house at Kew the handsome evergreen shrub DESPONTAINEA: SPINGEA was recently flowering freely. This attractive plant sellied to the Gentians, and was introduced from Pera about 1850. The leaves bear some-resemblance to the common Helly, as they are of a shining dark green colour, and the margin is spiny. The flowers are solitary and axillary; the corolla long, tabular, wax-like and bright-scarlet, while the five lobes are bright yellow. In help the plant is rigid but compact, and it succeeds well in a poting covernors of loan read or leafant and it requires and a compost of loam, peat, or leaf coil and cond; it requires cook treatment, but must be protected from frost, and is well suited

for the conservatory or greenhouse.

DURING a recent walk through COVERT GARDEN WE noticed that some small fruits were in great abundance, especially Strawberries, Black Currants, and Goosebezries. Cherries were not very numerous, Red Currants were only to be seen in moderate quantities, and Raspherries were rather scarce. We remarked that Peaches, although in fair numbers, were very unripe, and Grapes were certainly below the average. Large quantities of Peas are now being brought in daily, but

prices still continue rather high.

THE CARNATIONS AND PROGRESS in the garden of Mr. E. S. DODWELL, the indefatigable senior Secretary of the seathern section of the National Carnation and Picotee Society, are still extremely fine. Mr. Dodwell grows upwards of a thousand plants in 7, 8, and 9-inch pots. They are placed on platforms raised about a foot from the ground, and the best varieties when in flower are protected by stout awaings of canvas, and in a light well-ventilated greenhouse. Late as the Show was this year, it was yet a week too early for Ma-Dodwell; he was yet, however, highly smoosasth, and may be proud of the position he attained in the prize lists. Since the Show some seedlings of great beauty have expanded, and some idea of the extent of this phase (seedling raising), of Mr. Dodwell's practice may be formed when it is stated that he has tabulated descriptions of four handed descriptions. has tabulated descriptions of four hundred flowers this year. The seedlings are grown and flowered in beds, but all the best of them are being potted now for layering. This is a great work for one pair of hands, for the owner does all his own layering. But it is done with expedition. After the grass is trimmed a small, thin, sharp penknife is thrust through the stems and drawn downwards through a joint and out on the outer side of each layer, thus forming a tongue. When the whole of the layers on a plant have been tongued they are pegged into light and very sandy soil, which is placed on the surface of each pot. The pegs are of galvanised wire, and from nine to ten thousand will be required this year—some of the layers needing two pegs to fix them in position. About a hundred pots are layered each day, the layers averaging about ten in each pot. The soil being kept moist roots are speedily emitted, when the young plants are potted and wintered in the

collection now presents is one of great beauty, and the endelightful. The admirable condition of the plants and edieds of splendid flowers afford convincing evidence of at value of the Carnation as a suburban flower, and a for town gardens generally, for close by the garden at all Rise, Clapham, is the London, Chatham, and Dover sy, a which trains pass every few minutes, flooding the a with volumes of smoke. This is no doubt the finest lim of Carnations and Picotees to be found, and all all tree lovers of flowers, are welcome to see them. the present week, however, the best flowers will have It is difficult which section to admire most—the rich wied Selfs, the gorgeously marked Bizarres and Flakes, pure grounds of the Picotees with their clear and welland lacing. There is no wonder that the demand for these ming hardy flowers is increasing, and that Mr. Dedwell mit necessary to root every layer to meet the requirements many friends. Fine as are the best varieties now in serce it is certain, if Mr. Dodwell's health permits, that valuable additions to this grand germs of plants will from his skill and labour—a labour of love.

THE Exhibition of the northern division of the ROBAL CARNATION AND PROOTEE SOCIETY will be held starday next in the Botanic Gardens, Manchester, the cates Council granting £10 to the prize list conditionally the show be held in the Gardens on a Saturday, otherthe Ethibition would have been held on the day pre-Society. In the schedule two classes are open to all, two sowers of four hundred pairs of plants or less, and two to

s, and a special prize for twelve selfs.

Mr. Downth of Edinburgh states that HABRISON'S MUSE, bedded out in the north of Scotland, has stood wister and is now splendid. Mr. Hunter of Lambton the also speaks in high praise of this Musk as a bedding the last this year five thousand plants of it bedded out,

sich are giving great estisfaction.

That the herbaceous Pæonies, which include the the fact that they are only occasionally seen in collections the numerous horticultural exhibitions. At the recent dington show Mesers, Hooper & Co. of Covent Garden and some very beautiful varieties, which were much ed; and the collection staged by Messrs. Dickson, Brown, This at the National Rose Show held at the Botanic Blank, Manchester, was very fine. By far the largest and traried collection we have met with in private gardens we kly asw in the gardens of Poynton Towers, Cheshire, the feliage bold and striking, while the flowers were large and foliage bold and striking, while the flowers were bright in the and yet delicate, embracing every shade of colour—white, almon, crimson, violet and purple. In form the flowers ed from the most perfect of doubles to the pure and simple form; some of the varieties were also fragrant. The st portion of this collection came from M. Jules Marin files & Bourg-la-Reine, France. Mr. Christy takes great in these plants. The border in which he grows them is be of deep rich soil, while the plants are liberally treated bliquid manure both in the autumn and growing season. APROPOS of the VINES IN GERMANY August is called

the growers the Kuck-monat, or nursing month—the month which the young bloom fills and swells into the Grape. But that may nurse as she pleases; there will, says a correspon-tin the Daily Noves, be no Grapes, or only bad Grapes, year in that part of Germany which includes the region e Moselle and the famous Johannisberg. The cold winds the wet of July rotted the tender Grape flower on its

the wat or July restor and swept away all promise of vintage.

THERE are growing at the present time in the gardens Coombe Cottage two or three long rows of an old Pea known JEYES CONQUEROR, and in the opinion of Mr. Baker this. Pea productiveness and excellence of quality will put many the newer Peas in the shade. The pods are \$\frac{1}{2}\$ to 4 inches bet every pod is very firmly filled, and contains seven or the very large and bright green peas, delicious in flavour depressing every good quality desired by the cook. Mr. ther thinks most highly of it. Perhaps an objection to some

me and the greenhouse. The appearance which this | No Pius Ultra, and it is a most desirable Pea to grow where both quantity and quality are desired.

MANY of our readers are not aware that there exists in some of our most smeky manufacturing towns men whose love for the beauties of Nature leads them to form SOCIETIES FOR THE PURPOSE OF STUDYING OUB NATIVE PLANTS. recently had the pleasure of attending a meeting of one of these societies held in Union Street, Church Street, Manchester, and there we found over thirty members, who had on the Saturday afternoon taken long excursions and collected specimens one attention and some excursions and confected specimens of wild plants, Ferns, and Mosses, which at this meeting were freely discussed. The President, Mr. James Percival, named every specimen laid before him, which on the occasion of our visit must have numbered from two to three hundred. These working botanists follow all the week their various avocations in the workshop, factory, or the mill; and while the pursuit after botany adds to their knowledge, it also procures for them fresh scenes and purer air, which is conducive to a better state of health. Their knowledge of British plants would surprise many of the best of gardeners, while many of them are good pteridologists and muscologists. The Society we refer to was originated in 1836, and from its ranks have passed away several men highly respected for their knowledge. Among them may be named Mr. Richard Buxton and Mr. John Nowell, men whose talents were so well recognised that their correspondence reached from the peasant to the peer. These Lancashire botanists, to their praise be it said, carefully preserve the natural habitats of all wild plants, and frequently make journeys to Scotland, Ireland, and Wales in pursuit of their favourite study, and many of them are acquainted with the geological formation on which every British plant is to be found. Mr. Thomas Rogers, Oldham Road, Manchester, has been the Secretary to this working band of botanists now for many years, and though formerly a millwright, he is now conversant with almost every Fern whether British or exotic, and besides possesses a thorough knowledge of plants, mosses,

- Mr. W. Oddie, late of Rye Court, Ireland, has been appointed gardener to Henry Ovey, Esq., Roydon Lodge, near Ware. Mr. D. Jones, late foreman at Syston Park, Grantham, succeeds Mr. Poole as gardener to Selina Lady Milton, Kirkham Abbey, York; and Mr. R. Blackstock, late foreman at Brayton, Carlisle, succeeds Mr. Lister as gardener to W. P. H.

Vaughan, Esq., Golden Grove, Roscrea, Ireland.

- WE regret to announce the death on the 13th inst., aged seventy-one, of Mr. JOHN WEEKS at Temple Dinaley, Hitchin, where he has resided since his retirement from the business. Mr. Weeks was a man of great business aptitude, and by his skill and energy gave a great impetus to the erection of horticultural structures, and established the repute of the firm whose erections and mode of heating have been extensively adopted in both large and small establishments in this and other countries. The death of Mr. Weeks will in no way affect the business, in which he has not taken any active part since 1869.

SNAILS AND SLUGS IN GARDENS.—We were very much troubled with snails and slugs for several years. This year I have reared two broods of ducks, and soon after being hatched they were turned into the garden every morning, and there they remain all day. It is astonishing how busy the little things are all day running after all the insects they can find, and I find they do much less harm than the snails and slugs. When the ducklings become large it is well to keep them out of the garden.—C. EDWARDS.

OUR WILD PLANTS.

MR. ROBSON'S notes on British plants, on page 463 of the last and page 105 of the present volume, have much interested me as a lover and student of our native flora, both in cultivation, and especially as regards alpines in their native haunts.

Lycopodium Selago is certainly the most singular of the genus, yet its oddest feature is not mentioned. Most of the genus possess, like the Selaginellas, the habit of seeking fresh pasture by growing at the proximal end somewhat faster than they die at the distal or (original) root end, thus tending to spread radially from their first station. The L. Selago effects this in a different manner by throwing off its growing ends in by be the great height it has attained this season—over the form of viviparous buds, arranged whorl-like near the feet, but all Peas have this year grown above their average points of the shoots. These buds rest stiffly upon elastic scales rights. It appears to be an improved and selected form of or bracts in such a manner that on being brushed obliquely by the form of viviparous buds, arranged whorl-like near the a a passing sheep or by the hand they skip away, tip-cat fashion, to some distance, where such as meet with suitable quarters start into life on their own account. Unlike Mr. Robson, I have often found it sheep-nibbled, and find on tasting my growing specimens no special bitterness—nothing so unpleasant as the taste of the Ivy and Holly, which sheep readily eat. I find the Selago easy of cultivation, though it is sometimes killed by slugs eating the growing ends; an injury the plant seems unable to repair, as, like the Spruce it so curiously mimics, it has little or no reserve of dormant buds. I have it in a full north exposure where it has stood the late winter well, and is starting freely. If Mr. Robson cares to grow the plant I could soon send him some of the aforesaid buds, which readily start in a damp shady corner or under a glass.

readily start in a damp shady corner or under a glass.

Lycopodium selaginoides I find also tractable. It has a resemblance to S. denticulata, and though sometimes called an alpine, grows freely down to the 1000 feet level at the head of Lianberis Pass. L. Selago, too, grows (in Snowdonia), at all heights from 600 feet in Nant Gwynant to 3200 feet on the Glyders. Among the wilderness of huge blocks which make the summit of Glyderfach the most weird and wondrous crag scene in south Britain, may be found "cold frames" as it were of Nature's making, recesses where depth and shelter make amends for the want of lights or glasses, and floored with an inch or two of decayed moss. Here may be found lovely tufts and patches of Phegopteris and other Ferns, and here I have found the L. Selago perfectly rampant—nearly 2 feet high, yet with hardly a table-spoonful of roots, which and some inches of the stem are often in appearance dead, yet carry most vigorous heads, as though, seaweed fashion, the plant merely used its foundation for support and drew its nourishment from the atmospheric moisture, fully two-thisds of its life being spent inside the clouds. L. clavatum and L. alpinum I have always failed to keep alive any length of time. Specimens secured in August last on Y Lliwedd, where for the first time I found the two growing together (height 2500 feet), are alive but not thriving.

The *L. claratum* is hardly the common Club Mose in the Snowdon country, where Selago is far more frequent; but the most abundant of the species, if you go high enough, is L. alpinum. It, however, rarely descends below 1800 feet, except in places especially cool and cloud-haunted. I have found it

at the 1200 feet level on Y Foel-berfedd.

Euxifraga oppositifolia was profusely in bloom, a friend told me, at Whitsuntide in Cwm-glas, high up on the Snowdon side of Llanberis Pass, and about 2000 feet above sea level. I have been there perhaps a score times, and even in summer find it difficult to avoid seeing the plant, so thickly does it cover the rocks, especially the somewhat calcareous volcanic ashbed—now hard as the porphyry itself—which, perhaps from its deficiency in lime, it and other of the alpines so common there seem to avoid. It grows, too, on the greenstone, also somewhat calcareous. I have it well established in an open north aspect, where, within a space the size of one of your pages, I counted thirty-two open blooms, most of which lasted from March 2nd until April 15th, and a few well on into May. It grows high up the rocks on the N.E. face of Helvellyn above Red Tarn, where in May, 1866, I first saw it in bloom—one of those sights one can never forget. In April, 1871, I found it flowering profusely near the top of Y Fan-big, one of the Brecon Beacons, but only on one narrow ledge, which it nearly covered. At one end a coarse grass, which I carefully disestablished, was trying to crowd it out. The range consists of old red sandstone, and its cliffs present northward a magnificent geological section. They rise to within 20 feet of the height of Cader Idris.

The purple Saxifrage is thought by some to be difficult of cultivation, but here (Sale, Manchester), it grows and multiplies, though not by seed, as easily as Thyme or Stonecrop. In a wild state I never found it below the level of 1800 or 2000 feet—a level at which, in unsettled weather, the clouds will often float for days together, and at which the type of vegetation seems in many respects to change, notably in the abrupt cessation of the Heaths, though the Empetrum nigrum struggles

on to nearly double the height.

Cwm-glass is quite a garden for alpines. It and other places I could name used to abound with Holly Fern, now nearly rummaged out by guides and collectors. The following are still plentiful—Sedum Rhodiola, S. Forsterianum, S. rupestre, S. purpureum, quite distinct from S. Telephium, which I have not found nearer than in Anglesey (see "Phytologist;" is this paper still published?) S. anglicum, &c. Among Saxifrages,

oppositifolia, stellaris—alpine in habit, yet often carried down by floods; I found it last July close to Llyn Gwynant—nivalis I have not found, though it is recorded by Bingley and some late writers; hypnoides and crespitoss. Silene acaulis is abundant, though Wordsworth thought it so rare except in Scotland. Mine in cultivation nearly went off this spring, but is recovering. It seems to detest the snowless east winds of the lowlands. A very robust Thrift also grows in the Cwm (the combe of the south of England), also an Eyebright with large purple flowers. Parsley Fern is a weed as it were, especially on the screes, while the "ashbed" has it lines of weathering tufted and feathered with Asplenium viride, A. Trichomanes, A. Buta-muraria, and various forms of Cystopteris, &c. This and other rocks have in many places been grooved and fluted by the action of long-extinct glaciers into the likeness of plinths and base-moulds of some Titanic temple.

It is a grand place wherein to spend a long summer's day. From it you may reach the top of Snowdon, muscularly by climbing Crib-y-ddysgyl and walking westward along its edge, but the climb would hardly suit those afflicted with nerves; or lasily by going westward up steep grass until you open out Carnarvon Bay and the S.W. horizon, when a few yards, level or nearly so, land you in the Llanberis track about a half mile below the well-known spring, keeping the summit of Crib-yddysgyll to the left. The ascent of the mountain is from this side easily done in ten minutes, and is worth the trouble if only for the view of the main peak, which overtops it by but

80 feet or so.

That these alpines have, thanks to snow, no very severe cold to suffer, is proved by the index readings of an Elliott's minimum thermometer which I fixed twelve years ago on my favourite Lesser Glyder at a height of 3220 feet. The earlier the mountains are snow-clad the higher remains the index, which thus seems to read inversely as compared with lowland observations.—H. B. B., Sale, Cheshire.

P.S.—I find Saxifraga hypnoides and caspitosa, as well as in less marked degree oppositifolia, avoid if they can a very strong light. In the open the shoots form a promiscuous mat, but if near a wall or shrub tend thereto as though combed out

in that direction.

THE LATE HAILSTORM.

MR. DEAN's desire to render aid to the suffering by the terrible storm is a worthy one, but his appeal would be much more powerful and meet with a better response if he could state that the owners of glass structures cannot be insured against ruin by hailstorms. Farm crops, of course, can and are insured, and it would almost appear that garden crops and glass houses are not accepted by the Hailstorm Insurance Company, otherwise it is difficult to imagine, after the great loss incurred by florists and others two years ago, that a body so industrious and generally prudent should risk ruin which, by a little sacrifice, might be averted. As considerable doubt exists as to whether glass structures can be insured, it would be well if Mr. Dean, whose action is very commendable, could state the facts of the matter. If such property as that referred to cannot be insured, except perhaps at excessively high rates, the affluent would the more readily render aid where it appears to be greatly needed; and if it can be insured, the special publication of the fact would have the effect of inducing those to protect themselves from loss who have hitherto refrained from doing so.—F. R. H. S.

EUCALYPTUS GLOBULUS IN GUERNSEY.

THIS is now in bloom here, and a more beautiful tree it would be difficult to imagine, standing as it does about 53 feet high, with a well-proportioned head. The fine creamy white flowers with their multitude of stamens contrast admirably

with the glaucous foliage.

The structure of the bloom is very exceptional, the stamens being contained in a lid much resembling the cup of a large accorn. As the stamens grow in size and strength this reversed cup is pushed off and falls to the ground, which in this case is quite strewed with them. The under part or seed vessel on which the stamens are arranged is much like the aforementioned lid though larger. This encasement is highly scented with the same peculiar aroma as the leaves when crushed. This tree is growing in a garden at Fosse André. I have not been able to ascertain its age. Miss D'Auvergae of 8t. Jacques last year felled a tree that was then twenty years old, and though it lost its leader three times (in one instance

8 feet) it attained the height of over 60 feet, having in its reaches 60 feet high it has much to contend with, as the wind first twenty months grown 20 feet. When a tree in Guernsey at some seasons is excessively strong. There are many hand-

some specimens in the island, but I have seen none flower as | The Encalyptus should be planted in a garden sufficiently freely as that first described.

seed would be rather more hardy than those imported from Australia. Would you inform us what has been the general effect of last winter on this plant?—H. C. S., Guernsey.

[Ninety-nine out of a hundred of the trees in England were unfortunately killed. We regret this the more after seeing the great beauty of the flowering branch sent, a spray of which is represented in the annexed engraving.—EDS.]

BISHOP AUCKLAND HORTICULTURAL SOCIETY.

AUGUST 18TH.

This favourite northern Show was held under unfavourable circumstances. The date was fixed a fortnight earlier this year than last in the hope that better weather might be experienced, as than last in the hope that better weather might be experienced, as for three successive seasons the weather has been adverse, and never worse than this year. There is one pleasing fact that the Committee may congratulate themselves on—namely, that the new Bishop of Durham affords the Society the use of the park and the benefit of his patronage. The park itself is finely wooded, the ground is undulated, and a stream of water meanders through the centre—an admirable place for a horticultural Exhibition; and we may mention that passing the gates of the place, where we could get glimpses of the flower garden, the bedding seemed particularly fine; an abundance of bloom was on the Geraniums, the Violas and Lobelias being especially well flowered and were better than any we have seen this wet season.

To return to the Show. For the season of the year the products

To return to the Show. For the season of the year the products in all classes were exceedingly good, although in many classes there was only poor competition and florists' flowers were scarcely represented. In the open class for six stove and greenhouse plants the Society offered five prizes, the first being £9. This has represented. In the open class for six stove and greenhouse plants the Society offered five prizes, the first being £9. This has generally brought numerous entries, but only two exhibitors entered the arena this year. Mr. Johnston of Elmridge near Darlington secured the first prize with well-flowered plants, consisting of a very fresh Bougainvillea glabra; Clerodendron Balfourianum, very good; Ixora Dixiana, a fine plant profusely flowered and nearly 4 feet across; also a good Genetyllis tulipifera well flowered, and a fresh plant of Allamanda Schotti. Mr. Noble, Woodhorn, Darlington, was second, his best plants being Bougainvillea glabra, Erica retorta major, E. Massoni major, and a fresh example of Phoenocoma prolifera Barnesi. There were four competitors in the class for six fine-foliaged plants. The plants on the whole were very creditable and filled a good area of the tent. Mr. Westcott, Raby Castle, was an excellent first with finely coloured examples of Crotons undulatus and Johannia, good specimens of Gleichenia spelunces, Cyathea dealbata, Geonoma gracilis, and Alocasia Lowi. Mr. Niel Black, gardener to Mrs. Pease, Darlington, was second, staging good plants of Cocos Weddelliana, Encephalartos villosus, and Maranta roseo-picta. Mr. Noble and Mr. Lazenby, Woodside, Darlington, were placed equal thirds. equal thirds.

equal thirds.

For six exotic Ferns there were also four competitors, Mr. Westcott being again first with Dicksonia squarross, Davallia Mooreana, Gleichenia Mendeli, and Davallia polysticta, the young growth of which was beautifully tinged with bronze; and a very fine Todea superba over 8 feet across. Mr. Johnston was second, his collection including the fine hanging Fern Goniophlebium subauriculatum, the fronds of which were over 6 feet long. For six British Ferns Mr. Niel Black was first, and Mr. Johnston second.

second.

In the class for twelve stove and greenhouse plants there were four collections, and the plants presented a very imposing appearance. Mr. Johnston, Mr. Lazenby, Mr. Noble, and Mr. Black were awarded the prizes in the order named. Some very fine stove Orchids and foliaged plants were staged in this class. The class for two Orchids only brought out two competitors. Mr. Noble was first with Cattleya crispa with three fine spikes; Miltonia spectabilis was also good. Mr. Westcott was second, his Saccolabium Blumei with three fine spikes being very good.

Zonal Geraniums have always been a special feature at Bishop Auckland, and the plants on this occasion were meritorious, but some of them were trained too flatly. Mr. Stockey Greenfield was first, and Mr. Wrather second. This was a very effective class.

There were only three competitors in the class for twenty-four

There were only three competitors in the class for twenty-four There were only three competitors in the class for twenty-four bablias; in preceding years there have often been nine or ten. Mr. Clark, Rodley, was first with very fair blooms for the season of Criterion, Perfection, Queen of York, H. Watson, James Cocker, Henry Bond, Royal Queen, Burgundy, Mrs. Harris, John W. Lord, Thomas Wyatt, and Vice-President. Mr. Hitchin, Charlestown, and Mr. Shaw, Kidderminster, secured the remaining prizes. For twelve Dahlias there were five competitors. Mr. Joseph Barrow, Bronch Hall was first with a good atand: and Mr. Harkness. Brough Hall, was first with a good stand; and Mr. Harkness, Allendale, second.

Allendale, second.

ROSES.—For twenty-four blooms, dissimilar, there were only three competitors; Mr. Burrel, Heighington, being first with Marie Baumann, Capitaine Christy, Louis Van Houtte, Etienne Levet, Madame V. Verdier, François Michelon, Alfred Colomb, Princess Beatrice, Empress of India, La France, Star of Waltham, Ferdinand de Lesseps, Dr. Andry, and Duke of Edinburgh. Mr. Whit-

well, Barton Hall, a successful amateur caltivator, being second, and Mesers. Mack, nurserymen, Catterick, Yorkshire, thind. The three stands were very good indeed, and the Judges had no easy task to determine their relative merits.

Bridal and hand bouquets were not numerous. Mr. Lazenby

secured the chief prizes in both classes.

In the next section, from which nurserymen were excluded, Fuchaisa were very fine. Asters were also well shown, also Roses, in which Mr. Whitwell easily secured the chief prize. Herbaceous plants were exceptionally good. Mr. Wrather, gardener to Mr. Pease, Greencroft Hall, Darlington, being first with Spirza palmata wasa. Achillea serrulata. Alstromeria aurea, Ericeron and mata rosea, Achillea serrulata, Alstroemeria aurea, Erigeron speciosus, and a fine variety of Monkshood—Aconitum versicolor.

ciosus, and a fine variety of Monkshood—Aconitum versicolor. Some very good table plants were also shown in threes. FRUIT.—This was a special feature of the Show, and some excellent produce was staged. In the class for eight dishes, distinct sorts, there were three competitors. Mr. J. R. Jowsey, gardener to Gilpin Brown, Esq., Sedbury Park, Richmond, was first with Black Hamburgh and Muscat of Alexandria Grapes, both good; excellent Royal George Peaches, Violette Hâtive Nectarines, Largo Negro Figs, Strawberries, Cherries, and Raspberries. Mr. Laidler, gardener to the Rev. J. Burrow, Castle Eden, was second, stagring good Black Hamburgh and Buckland Sweetwater Grapes.

Laidler, gardener to the Rev. J. Burrow, Castle Eden, was second, staging good Black Hamburgh and Buckland Sweetwater Grapes, and Royal George Peaches.

Mr. Jowsey also won the first prize in the class for six bunches of Grapes in three or more varieties with fine examples of Barbarossa, Muscat of Alexandria, Black Hamburgh, and Foster's Seedling; Mr. Westcott being second with Black Hamburgh, Muscat of Alexandria, and Waltham Cross; Mr. Witherspoon taking the remaining position. His three bunches of Black Hamburgh were fine in colour and shape, and received much admiration. but his or Alexandria, and Waitham Cross; Mr. Witherspoon taking the remaining position. His three bunches of Black Hamburgh were fine in colour and shape, and received much admiration, but his white Grapes were not fully ripe. For two bunches of black Grapes Mr. Larkin, gardener to the Bishop of Durham, was first with two fine bunches; Mr. Witherspoon being second. For two bunches of black, Lot Hamburghs, Mr. Larkin was also first with Black Alicante; and for white Grapes, not Muscats, Mr. Westcott secured the first place with Personn's Colden Oneen secured the first place with Pearson's Golden Queen.

Peaches were excellent, nine dishes being staged. Mr. Lazenby was first with Exquisite, which was exquisite in every sense. Nectarines were of average excellence, Mr. Niel Black being first with Elruge. Strawberries were magnificent; Mr. Harkness, Allendale, was first with very large finely coloured fruit. Melons were few and seemed of inferior merit. Apples, Pears, and Plums

were also inferior, no doubt owing to the unpropitious season.

VECETABLES.—Some excellent dishes of Potatoes and vegetables were staged. Mr. Ryder's eight dishes of Potatoes—International Kidney, Grampion, Myatt's Prolific, Rivers' Royal Ashleaf, Excelsior, and Webb's Imperial were really splendid.

The remaining section of the Show to be noticed is that devoted to the smateurs certainly a most deserving class. Their florists' flowers and vegetables were particularly fine, in fact in some cases excelling the products in the open classes. The Committee and Secretary, Mr. Hendry, acted with promptitude in all their arrangements which were admirably carried out. Plenty of Judges were provided, and the work was quickly and well done, and appeared to give general satisfaction. We trust that this once fortunate Society may in the future have better weather and be well sup-ported, and again have shows second to none in the north of England.

A TRIP TO WALTHAM.

On the occasion of my visit to Waltham to inspect the Roses I was doubly unfortunate; in the first place I had barely two hours to spare for the inspection, and secondly I was unable to see Mr. Paul himself, and had to make his foreman do

One principal object I had in view was to see in their own quarters the two fine new Roses Duchess of Bedford and Countess of Rosebery, and I was not disappointed. I think I shall never forget a bed about 15 or 20 feet square of fine strong dwarf plants of Duchess of Bedford. This splendid new Rose seems to be distinct from any other; it is of the brightest crimson with a slightly darker shading, fine in foliage, and very free in growth and flowers, which are of fine shape with abundance of stout petals. I think it is the nearest approach I have seen in colour to John Bright, but far superior to that fine Rose in form, &c. If it is not the finest English Rose ever sent out it is certainly unsurpassed. Countess of Rosebery is also doubtlessly a very fine Rose of a lighter colour than the other. It grows almost as freely as a climbing Rose, but with strong stout shoots; the blooms, which are something after Victor Verdier, have very large petals. Other Roses sent out by Mr. William Paul and growing in abundance are Magna Charta, free in growth, making a fine pillar Rose, but with rather loose flowers; Star of Waltham, very fine, and May Quennell, excellent in growth, foliage, and flower. Of other seedlings not yet introduced to commerce there are several

which will probably improve upon acquaintance. The best appeared to be Masterpiece, a very promising Rose, after the specific of Star of Waltham and Pride of Waltham, which somewhat recembles the Eugénie Verdier-Marie Finger race.

Of the new Roses other than those sent out by Mr. Paul the fellowing were very fine:—Alfred K. Williams, Al in every particular—a splendid acquisition; Gabriel Tournier, very large, deep rose colour; Marchioness of Exeter, very fine, similar to La Ville de St. Denis; Richard Laxton, a very fine dark Rose of the good old Marchal Vaillant type; while the new Tunn, Madame Nabenmand, pale fiesh colour, and Madame Lanked, bright rose, with the Hybrid Tea Madame Alexandre Bernaige, a beautiful pointed globular flower, similar in colour to the good old Tea Adam, will all be wanted by the group of the choicest varieties.

Of the older varieties there is a very large assortment in cultivation, and I was glad to find that the queen of all, Marie Baumann, had this year been as fine as ever. The blooms zero a little past the best at the time of my visit; but there were still some magnificent flowers. At Waltham, and most large Rose-growing nurseries, nearly all varieties are tried upon all stocks in order to ascertain which suits them best, and, as I had thought the very contrary, I was very much surprised by see that the poor-growing but splendid Rose Louis Van Houtte dees better both as regards growth and flowering on the Manetti than on the seedling Brize. I should like to know-whether this is the case at other places. Mone. E. Y. Tens. Charles Lefebvre, Xavies Olito, Alfred Colomb, Sulten of Zamithez, and Duke of Eddinburgh among the dark varieties were in splendid condition, as were the light varieties lialatuse Lacharme; Duchesse de Valloudroen, Gapitaine Christy, La France, Marie Finger, and Princess Reatrice.

In coming away I saw three or four men hard at work building: a large piece of Menettis. This: piece contained between 20,000 and 60,000 stocks; and some idea of the number of Rosse cultivated here may be formed when it is considered that there are equal or greater naudates on other stocks, seedling Briar, standard, &a., besides an enormous number in pots. My time was now up and my train was due, so that I had to run off without being able to inspect the fruit and other departments of this fine nearery—J.B.

THE OLD MARKET GARDENS AND NURSERIES OF LONDON.—No. 25.

SPERDIME towards the metropolis by the Brighton or South-Restern lines of rail, between New Cross and Spa Road stations, there is an impression that one is travelling over land not much above the level of the Thames, an impression tolerably correct; and a multitude of dines intersect each other, the spaces between and around these being; to a considerable extent, complete by market gardeners. If the train is not preceding very rapidly the traveller may take note of the various vegetables under culture, fruit not being produced in any quantity, probably because the atmospheric conditions are unfavourable. Many new strests are springing up: "like limbrooms," says the penny-a-liner, and he is tolerably accounts, for the houses have a fungoid: feebleness and their foundations are in the damp. The Londoner who has often visited his city's suburbs may probably compare the district to that of Battersea, where now, however, there are even more railways crossing, and houses are also more numerous. A visitor from abroad would also be somewhat surprised were he teld that from the market gardens of London schurbs quantities of produce are surn every year to towns in the north of Hugland. It is a plan found to be advantageous to both grower and consumer, even at the present not very modemate railway charges.

Year by year, there are such changes in the vicinity of London, owing to the increase of buildings, that it is difficult to estimate the land under cultivation in any particular distinct; but there are still many agree of open land lying not first from the river—in Bermondsey, Depution, and New Cross. Since 1875 builders; have taken possession of a largish tract of land mear Peek, Brean, & Co's factory, which was garden ground till then, and which is fast being covered with inferior houses, massed together far too closely. Certainly the inhabitants have the advantage of market gardens near them, amongst which they may stroll, for the land is broken up by numerous roads and footpaths; indeed, the comparatively exposed condition of the garden ground heresbout is either a testimony to the honesty of the people living near, or elee on calculation the growers find it cheapen to submit to a per-

centage of loss of produce rather than make and maintain effectual fences.

Bermondsey, however, in some portions of it is hardly likely to tempt the most speculative of builders, and we imagine for many years to come it will have its market gardens, amongst which it is impossible to distinguish those of ancient date from those which have been formed more recently by the coltivation of grass or waste land, when some of the garden ground was taken for other purposes. At one period these gardens extended close to the Thames at Deptford, and towards Greenwich. The recently formed Southwark Park was also a wise dedication of a part of garden space to the public benefit. The closing syllable of "Bermondsey," as in other localities, implies a watery situation, and it once had even its islands; and its Spa, to which pleasure grounds were attached, was formerly a popular resort. Numerous streamlets flow towards the river. Some of these are said to have been artisicially made in the fourteenth century to free the land from an overflow of water, for in or about the year 1294 there was a great breach" at Rotherhithe, and probably many acres laid for a considerable period under water. During the building of a church at Barmondsey the excavators came upon the remains of an old wood, peat being dug up formed of trees and rushes, and through some antiseptic influence "quantities of nuts were found still hanging upon the bannches." day Book also states that there was woodland for five hogs at least in Remnondary, and moorns were then, at one season of the year, an important article of food for: wine, sometimes for mankind. If we are to believe the prognostics of some folks about this year's harvest we might do well to prepare ourselves for such diet. Accuse, though not over-palatable, are certainly

There cannot be a doubt that the first market gasdeners at Bermondsey were some of the Flemings, who, on their arrival in England about 1560, settled in various places near the coast of Kent. Finding that the new vegetables they introduced were generally liked by the English several of them migrated, coming mearer to the metropolis, where they could be sure of a ready market for what they grow. Travelling through Kent they passed by way of Lewisham or Blackheath to settle again at Hermondsey and Deptford, getting land there at a low rent me doubt. This would be towards the end of the sixteenth contary; one or two more adventurous. "stepping westward," went on to Nine Ellms and Battersea. Hartlib, writing in 1650, refers to the astenishment awakened by the crops of Cauliflowers, Carrots, Furnips, and Parsnips, which old men told him were unknown as growing plants until they were reared by those emigrants. One of the species that was largely cultivated in the Bermondsey gardens probably was the Jersealem Artichoke, for Parkinson observes that in the reign of Charles II the tubers were so plentiful in London that even the common people despised them. The name "Potato" was originally given to these, which it was the fashion then to bake in pies with small birds (such as larks), dates, or raisins, &c.

Asperagus was another of the specialities of the Flemings, and Evelyn, who resided at Deptford, no doubt received from some market gardener in his vicinity the fine specimens of Dutch Asparagus which he describes, and which were grown in richly manured soil; for his own part, however, he owns that he gave the preference to the smaller sort. But he extols the general virtues of this vegetable, recommending that it be eaten raw with oil and vinegar. At Sayes Court he himself made anndry experiments in hortioniture, and when Samuel Pepys paid him a visit on May 1st, 1665, he seems to have been astonished at Evelyn's garden. Incidentally, in his note upon that day's doings, he drops us a useful remark; for he went also to Wricklesseamh House, where, he says, he saw the first vineyard he had seen in England, proving thereby that the various vineyards which once flourished near London City had disappeared before the civil wars. We are informed that the descendant of John Hvelyn who now holds Sayes Court has converted the gamles into a pleasure ground for the people of the neighbourhood. It is recorded, or should be recorded, in the annuals of culinary plants that Rhubarb, seeds of which were sown in England during 1680, was not regarded as anything except a cariesty, nakes cultivated for medicinal purposes, until about seventy years ago, when Mr. Myatt of Deptford sent his sens to the Borough Market with five bunches of the stalks, and they could only sell three of these. The name of "Rhabarb" caused a prejudice against it, but when it became a favourite the demand was soon greater than the supply. The Myatts were market gardeners at Deptford for many

years; subsequently we find Mr. W. Myatt occupier of the Manor Farm, Lewisham, where there was a sale of plants in 1875, the land being required for building. Myatt's Ashleaf is a favourite Potato, perhaps having its origin at Deptford. We have noticed, by-the-by, that Rhubarb and Coleworts are frequently the last plants grown on land which market gardeners are about to relinquish.

Those who wish to visit the market gardens yet extant at Bermondsey and Deptford may reach them by the Old Kent Road, turning out of it on the left, either down the New Botherhithe Road or the Manor Road; they are divided by the Surrey Canal, and as already stated, cut up by numerous lines of rail. On the right side of the Old Kent Road towards Peckham there was also formerly some extent of garden ground, and we remember observing one or two nurseries thirty years ago; to our surprise one of these still remains in the Trafalgar Road, though now it has very little land attached to it. Pursuing the Old Kent Road to its end we come to Hatcham, once quite rural, and having a park-like domain, the residence of the Hardcastles, and where we may yet find the Manor Farm. Beyond this is New Cross. Here, some fifty years since, the late Edward Newman had a ludicrous rencontre while gratifying his enthusiasm for entomological pur-suits by the chase of the Clouded Yellow Butterfly. He says: "Dian's nymph Hyale has led me a merry dance amidst the blooming Lucerne. It was where the Croydon railway intersects those Surrey hills which constitute the first glimpse of country as we emerge from the fuliginous sea of London habitations; it was here in market gardens forbidden to the public that I made her acquaintance. There were employed a multitude of female Hibernians in the healthful pursuit of horticulture. On one occasion my quarry led me into their midst, when lo! they abandoned their occupation, and pursued me with the very same energy that I was wasting on the yellow-robed nymph."
The insect has vanished from the spot, few of the market gardens are remaining, and fields of Clover and Lucerne must be sought further in the country. Mr. Orsman's nursery at New Cross is one of the oldest in the district. It bears the name of "Florence," from its proximity to Florence Road, not because it is representative of the Italian style of gardening. Berkley's nursery is close to the North-Kent line, and at the junction just beyond St. John's station a small but prettily arranged nursery has been surveyed by travellers ever since the line was constructed, we believe. It has recently been converted into a private residence apparently. Amersham Road, New Cross, boasts of a "parfumeur chemiste," but we don't know whether he grows there the plants that he distils. The sign of the "Rosemary Branch" in Lewisham Road is a reminiscence of some early "physic garden."—C.

MESSRS. SUTTON & SONS' ESTABLISHMENT, READING.

ALL who are interested in either horticultural or agricultural pursuits that happen to have an opportunity of visiting the premises of this eminent firm will, I am convinced, think the time occupied in doing so well spent. This at all events was the opinion of myself and companion—a very practical gardener—after our "run through." It is almost impossible, without apparently exaggerating, to give a description of the warehouses, offices, &c., and we, who to a certain extent were aware of their magnitude and the vastness of the trade of this firm, were still quite unprepared for the reality. The first week in August, as far as the seed trade is concerned, was far from the best time to pay a visit, as no doubt it is one of the slackest times of the year, the principal work going on being the preparation for the immense stock of seeds bulbs, &c., shortly to be accumulated; but on the other hand we were fortunate in being able to inspect the very instructive trials of Peas, Lettuces, Beet, Potatoes, &c., annually conducted at their trial farm. The systematic arrangement and completeness of the various offices and buildings, including a splendid recreation room and library for the use of the employés, café and fecture hall, &c., are, I may safely say, unique. Although the Messrs. Sutton do not actually grow all the seeds they distribute, yet none are sent out but what are grown especially for them by competent growers from stocks of which very careful pedigrees are kept by the firm. Great pains are taken in the selection, dressing, &c., of seeds which are subjected to severe tests both as to their vegetating powers and also to the trueness of the strain, whether they be minute flower seeds or vegetable, farm, and grass seeds.

Seeds intended for export through tropical districts are specially prepared by being subjected to a very high dry temperature, thus preventing the loss of a great per-centage of seed by fermentation during transit. We went into one room stated to be of the same temperature as the hold of a vessel in the Red Sea, and not having any superfluous flesh we wished to be rid of, soon made for the door again. The seeds intended for export are packed in air-tight tims, of which there were large quantities of various sizes in store, which from their superior make and finish must prove very serviceable in many ways to the importers. Such at all events is the evident aim of the exporters. Steam power is used to drive the machinery in use in the warehouses, dressing rooms, &c., and very great precautions are taken in the way of having a good supply of water, hose, and engines in the event of a fire breaking out; in fact, if I remember rightly, Messrs. Sutton have their own fire brigade.

The houses devoted to the growth of florists' flowers situated within easy distance of the warehouses are well adapted for the work, and at the time of our visit were filled with many thousands of well-grown plants, all raised from seed of the same strains as those distributed. The house of large-flowering Begonias was wonderfully attractive; the plants either singly or collectively were grand, and a finer strain we have never seen. They were unusually compact, and were bearing a great profusion of very fine flowers of all the hues to be met with in this extremely beautiful and useful section of the genus Begonia. The collection included several remarkably fine double-flowering varieties, which were flowering freely. Two other houses are devoted entirely to Gloxinias, and a grand lot of plants they contain. They are from seed sown this spring, and will soon present a very fine display. The foliage is particularly good (a very excellent characteristic of the strain), nearly hiding the pots, and many very fine blooms were already expanded. Cyclamens, too, are grown in large quantities, and will eventually give a fine display. The foliage is particularly attractive, which is of importance. Cinerarias, Primulas, Calceolarias, &c., are all being brought forward. They have also a fine lot of Caladiums, and a batch of the pretty and useful pot plant Streptocarpus biflorus. It is grown in a cold frame, and will produce its blue Gloxinia-like blooms throughout the remaining summer and autumn months. It is sometimes called a hardy Gloxinia, and it certainly resembles a Gloxinia in its habit and flower and ought to be more generally grown.

In the grounds in which the houses are situated are grown many of the choicest annuals, and judging from those we saw the strains of Stocks, Zinnias, Marigolds, &c., are particularly good, and the colours very true to name. We were, however, rather too early for the Asters and a few other species.

We were next conducted to the trial farm in which the very large beds of showy annuals are sown which prove so attractive to the occupants of the trains passing on the Great Western and South-Western railways. Very conspicuous were the beds of Bockets, Larkspurs, Convolvulus minor, Chrysanthemum Burridgeanum, &c., Clarkias, Candytuft, Nasturtiums (Tropsolums) of the Tom Thumb section, which are useful for beddingout, as they do well either in wet or dry seasons, thriving where many other plants fail. A good substitute for Calceolarias are the miniature French Marigolds, both orange and yellow, which were very true to name.

In another part of the farm we were shown good sowings of all the varieties of Peas, Lettuces, Beet, &c., catalogued by Messrs. Suttons, which afford excellent opportunities for noting the merits or demerits of the many varieties grown. The earliest Pea was found to be Suttons' Ringleader, but the Emerald Gem followed it closely, and is in every other respect the best Pea. William I. was also very good. Following very closely upon these we observed Suttons' Bijou, a dwarf free-bearing Marrow Peas of fine size and quality. Among the medium-height Peas very noticeable was Suttons' Prince Leopold, a variety that stands dry weather, and judging from its appearance when we saw it, is also equally useful in a wet season. Dr. McLean fully maintains the high character given it; and among the taller varieties Fortyfold, Suttons' Giant Emerald Marrow, Duchess of Edinburgh, and the Emperor of Marrows were bearing well, and are all of undoubted excellence. Lettuces were at their best, and none surpassed that useful variety for summer work, Suttons' Superb White Cos. All Heart and Suttons' Champion Brown Cos were also very fine. The Green Ground was also very good; although not much to look at, the flavour is much liked by some. Among

the Cabbage varieties the most noticeable were Blonde de Berlin, Suttons' Queen, Standwell, and New Fringed, the latter on account of its singularly ornamental style of growth. Of the Beet, for beauty and evenness of foliage none surpassed Suttons' Dark Red and another new variety, the leaves of which are of the same dark crimson colour, but are longer and narrower. The strain of ornamental Chilian Beet is a good one, some of the varieties being exceedingly handsome and well adapted for subtropical gardening, &c. Many other varieties of vegetables, grasses, roots, &c., are being tried, but want of time prevented a close inspection and curtailed what was to us a very enjoyable and instructive visit, which was greatly enhanced by the courtesy and kindness shown to us.— W. IGGULDEN.

RIVINAS.

THE majority of plants natives of tropical regions that require to be grown in a stove when introduced to our temperate climate, are characterised by either graceful brightly coloured and variegated foliage, or by handsome and fragrant flowers. But there is another class of plants which, though well represented in our shrubberies and greenhouses, is almost entirely absent from the stove—viz., plants that are useful for ornamental purposes owing to their pretty and attractive berries. Indeed if we exclude the Rivinas and Ardisias there is scarcely another of this description to be found with any pretensions another of this description to be found with any pretensions to beauty, unless it be the curious Mistletoe-mimic Rhipsalis salicornioides. This is certainly a great deficiency, as the length of time that berry-producing plants continue attractive, and the pleasing variety afforded by the bright colours of their small fruits, render them extremely valuable for gracing the shelves of houses during a great portion of the year, for table decoration and decorative purposes generally. On this account the genus Rivina is an especially interesting and useful one, or at least much of the species that are best known to plant. or at least such of the species that are best known to plantgrowers—R. humilis, R. lævis, and R. lutescens. About seven other species have been introduced, but they are rarely to be met with except in botanic gardens, and they are decidedly inferior in a cultural point of view to the three mentioned. With one exception all are natives of the West Indies and South America; and that one, R. latifolia, is very widely separated from its relatives, for it is found in Madagascar.

The species which is most commonly seen in cultivation is R. humilis, and this was introduced some time during the seventeenth century, as it is stated to have been grown in England previous to 1690. The merits of the plant are of no ordinary character, and it is only of late years that growers tave begun to appreciate its beauty as a table plant for which purpose the graceful habit and bright berries render it particularly appropriate. There appears to be some little confusion respecting the identity of this plant, as it has frequently been mistaken for R. lsevis and vice versa; but there is no occasion for the uncertainty, as they are easily distinguished by anyone who has seen the two growing together. R. humilis has downy acutely ovate dark green leaves, and racemes of dark crimson or crimson-scarlet berries, is moderately erect in habit, and of

The cultivation of the plant is remarkably easy; it can be increased either by seed or cuttings, some growers preferring the former method, others the latter; but it is of little consequence which mode is adopted, as nearly equally good results are with ordinary care obtained in both cases. If the plan are with ordinary care obtained in both cases. If the plan first mentioned is preferred strong cuttings should be taken in early spring, inserted in sandy soil, and placed in a warm corner of the propagating frame. When well rooted the young plants should be potted singly in thumbs or small 60's, employing a light soil composed of loam, leaf soil, and sand, providing good drainage. As the plants will grow quickly if placed in the stove or a house of similar temperature reporting will soon be required, and this must be attended to so as to will soon be required, and this must be attended to so as to avoid giving a check to the growth. They may be shifted into 5 or 6-inch pots, employing a similar compost to the last, and this size pot will be found the most convenient and useful for

the plants to remain in.

Flowers are produced freely, and appear to be quite independent of insects for fertilisation, as nearly every flower is succeeded by a perfect fruit at all periods of the year. One defect is occasionally experienced—viz., a tendency of the berries to fall prematurely; but we are inclined to regard this as chiefly due to an insufficiency of water at some time, or possibly to a deficiency of nutriment in the soil. As a remedy

we recommend careful attention to watering and frequent supplies of weak liquid manure. Seed should be sown in March, and when the young plants appear they may receive the same treatment as cuttings. Flowers and berries are produced through a great portion of the year, and with a good stock of plants a succession may be maintained from January to December. A little judicious pruning is sometimes required to preserve a good form, or training may be resorted to; and here we may mention, that although rarely seen so treated, it succeeds admirably if trained to a wall or trellis. The purpose for which it has been principally grown of late years is table decoration, and few plants could excel it for gracefulness and beauty. The racemes of berries are also invaluable for epergnes and vases, and interspersed amongst flowers and foliage their effect is charming. It is somewhat surprising that market growers do not take up its cultivation, for undoubtedly it would be readily sold. A few specimens planted out in a stove or intermediate house will afford a valuable supply of sprays for cutting, and the racemes will be larger and more plentifully produced than when the plants are growing in pots.

We have referred at length to the cultivation of these plants under R. humilis because that is the most common, and also for the reason that the other species succeed with precisely similar treatment. R. lævis is distinguished from R. humilis by its perfectly smooth shining leaves and looser habit, but the berries resemble those of the latter, except that the colour is brighter. This plant is also an old one, for it was cultivated by the noted Philip Miller in 1733, so that no doubt it appeared in this country very shortly after the other. This is equally beautiful, and as well adapted for ornament either in the stove or on the dinner table as R. humilis, and deserves to be much

more extensively grown.

There is another form which is occasionally seen in good gardens that is named at Kew R. lutescens; this bears yellow berries, and thus forms a pleasant and striking contrast with the crimson berries of the other species. It is of more recent introduction than the others, and requires precisely the same treatment. The berries are smaller than those of the other species, and the plant is not quite so attractive, but no doubt it would improve under more extended cultivation.—Lewis CASTLE.

ON CIRCUIT. TAUNTON.

My last assize for the season (if I except the possible one of Brie-Comte-Robert, at which I have been asked to assist) was at this pleasant county town of Somerset, where for some years it has been a happiness to me to renew and keep alive a friendship which originated on a mere chance salutation from one English youth to another on a steamer on the Rhone forty-two years ago, and to act as Judge at the most flourishing autumn show I know and to act as Judge at the most flourishing autumn show I know of in England; and as we looked round on the thousands that thronged the Vivary Park on Thursday last, our thoughts involuntarily looked back to those days when the brutal Jefferies held his bloody assize in the town in the autumn of 1686. We sometimes talk of the good old times; but, if we could only see it, these are the good times, and such scenes as on Thursday met the eye, when the whole town was en fite—not to welcome an aspirant to a throne, but to do honour to that gentle pursuit which almost everywhere in England finds a hearty following—ahowed in what

eye, when the whole town was en fête—not to welcome an aspirant to a throne, but to do honour to that gentle pursuit which almost everywhere in England finds a hearty following—showed in what happy times of peace and loyalty we are living.

I have no hesitation in saying that the Exhibition of this year was not only superior to any of its predecessors, but that it was the very best autumn Show I have ever seen; of course there was a deficiency in out-of-doors flowers. Not a Gladiolus was seen, Asters were few and wretchedly poor, and Dahlias were scanty. How Messrs. Keynes got those in that they did show was a marvel not only to me, but to so good a grower as Mr. Turner. But the stove and greenhouse plants in flower and foliage were superb, and I very much doubt whether a tent so full of specimens of first-rate plants was ever exhibited in the month of August at any provincial show, and certainly not at any metropolitan one. The Society very liberally offered for the best twelve stove and greenhouse plants in flower prizes of £25, £15, and £10. There were four entries for them, and the prizes were taken by Mr. Cypher, Mr. Williams of Worcester, and Mr. Pilgrim. Mr. Cypher's plants were Clerodendron Balfourianum, Erica Irbyana, Allamanda Hendersoni, Ixora Cypheri, Erica venosa, Bougainvillea glabra, Dipladenia amabilis, Allamanda grandiflora, and Lapageria alba. Mr. Tudgey had Erica ampullacea, Dipladenia hybrida, Allamanda nobilis, Anthurium Scherzerianum, Erica parmenteria rosea, Eucharis amazonica, Allamanda Hendersoni, Clerodendron Balfourianum, Statice profousa, Dipladenia amabilis, and Erica Irbyana. In the class for six stove and greenhouse plants Mr. Pilgrim was first with Dipladenia

amabilis, Erica austriacs, E. Thompsoni, Allamanda Wardleyana, Anthurium Scherzerianum, and without doubt the finest plant of Rhododendron Princess Royal that I have ever seen, or perhaps has ever been exhibited.

So great and so even was the competition in the class for foliage plants that the Judges were compelled to give two equal firsts and two equal seconds. The firsts were gained by Mr. Lawless and Mr. Pflyrin; the equal seconds were Mr. Cypher and Mr. Williams. Mr. Lawless' plants comprised Alocasia intermedia, a grand and faultless plant; Croton variegatus and C. pictus, finely coloured; Livistonia altissima, Latania borbonica, Croton Weismanni, Cycas revoluta, and Euterpe edulis. Mr. Pilgrim's were Croton undulatum, very fine; Cordyline indivisa lineata, Croton Weismanni, Cycas imperialis, Gleichenia rupestris, Encephalartos villosus, Gleichenia semi-vestita, and Cocos Weddelliana. Mr. Cypher's were Gleichenia Mendeli, Croton undulatum, Dasylirion accorrichum; while Mr. Williams had Croton Johannis, Gleichenia heterophylla Croton pictus. Latania borbonica. &c.

cum, Prichardia pacinca, Latania borbonica, Croton undulatum, Dasylirion acrotrichum; while Mr. Williams had Croton Johannis, Gleichenia heterophylla, Croton pictus, Latania borbonica, &c.
Where all round the Show was so good, fruit (indoors) being excellent and vegetables fine, it may seem invisions to pasticularise anything, but as an *kebitus' of fisewer shows I may mention two exhibits which I think struck mest people—Mr. George Prince's Roses and Miss Cypher's beuquet. The former were the best forty-eight I have seen this year, and Mr. Turner and I agreed that such a stand was never shown in the menth of Angust by any exhibitor before; the size, substance, and colour were alike wonderful. Amongst the most noticeable were Charles Lefebvre in wonderful colour, Marie Baumann, Devienne Lamy, Duc de Bohan, very fine; Marie Rady, as good and large as Marie Baumann; Louis Van Houste, very fine; Alfred Colomb, Constone de Rodailhae, most levely; Madame Victor Verdler, Annie Wood, Duchesse de Morry, Margeerite Brassac, Marquise de Mortemark, Exposition de Brie, with a hue of brownish crimson in it quite distinct from either Ferdinand de Lesseps or Maurice Baraardia.

The bouquet exhibited by Miss Cupher was, the most exquisite

The bouquet exhibited by Miss Cypher was the most exquisite one I have ever seen. Is there anything so impossible to describe as a bouquet? Suffice it to say that this displayed the most consummate knowledge of the art combined with refined taste. These was not a flower with any glaring colour in it. The blue was the soft blue of the Agapanthus sparingly used; the red and yellow were combined in an orange-coloured Ixora; there was the lovely soft pink of the Dipladenia; while the whites were the beautiful and elegant Pencretium, Lapageria alba, Stephanotis, and Frances; and with the Maidenhair made a most lovely enemble. Har table decoration was also excellent. It was arranged for ten. In the centre was a Marsh stand with a trumpet top, and at either end a small plant of Coocs Weddelliana with some specimen glasses, all arranged very lightly and elegantly; and I must say that although the present fashion is in favour of low decorations on the table, I prefer those of this character, where, as in this case, the view is not obstructed.

The indefstigable labours of the Committee and the able Secretary, Mr. Clement Smith, were crowned with success. A fine day brought in thousands from the neighbourhood, and upwards of £300 was taken at the gates, besides the large number of subscribers' tickets used. It is thus that they do things in the "West Countrie,"—D., Deal.

REVIEW OF BOOK.

Arran, its Topography, Natural History, and Antiquities. By the LANDSBOROUGHS, Father and Son. London: Houlston and Sons.

This little work has much to recommend it, not only to the general reader but to the naturalist and antiquarian, for we find recorded the observations of that eminent and genial naturalist the late Dr. Landsborough. The island of Arran, so well known to tourists in the Hebrides for its exquisite and varied scenery, is described in a most delightful and edifying manner; its history, botany, zoology, indeed every matter of interest connected with the island, is treated so exhaustively, accurately, and elequently, that the reader cannot fail to perceive it is the production of a finely trained and highly educated mind. There is also a charming originality and freshness in the style that is rarely to be met with in modern works. The author is especially happy in his descriptions of the picturesque scenery, and of this we notice a good instance on page 15, where the writer is describing the views obtained by a voyage round the island. He continues thus—

"Two views far surpass all the others—those from the bays of Sannox and Brodick. Sannox is seen to greatest advantage from the sea, and never is more enjoyed than when rowing leisurely on a summer evening from Seuth to North Sannox Bay, for thus there is time fully to take in the whole impression of its grandeur. Not so grand as Glen Sannox, but adding to grandeur much greater beauty and variety of attraction, is the view from the south-east of Brodick Bay. Let it be seen from a boat on a sum-

mer evening, when the light clouds floating in the sky cast shadows moving mysteriously over the landscape; when the ridges and fine peaks of the rugged encircling mountains, burnished by the golden beams of the setting sun, stand in striking contrast with the deep shade of the far-receding glens; and when the mellow light of evening, with its calm and holy stillness, is settling upon and softening the green fields, rich woods, and happy homesteads, encircling the slumbering waters of the immediate toreground."

In the next chapter is an account of "the great achievement of a visit to Arran," the ascent of the mountain of Goatfell, upwards of 2866 feet in height, and here on page 24 we find another eloquent description.

"The view from the summit of Goatfell is one of the most extensive and magnificent in Scotland. Some of the more notable objects are so distant that they lose much of their impressiveness; but the nearer view embraces a combination of sea, frith, and loch—of island, bay, and rocky promontory—of deep solitary gless, frowning precipioes, and rugged, jagged, savage pinnacle and mountain ridge, unequalled in the British Islands.

"Look from the gidey height of prend Ben-Gholl
On peaks inaumerable, sky-cleaving:—Look
Adown the rugged elifs precipitous
Into the dark, and deep, and narrow chasms,
Those gulfs obscure, which from each other part
This vast assemblage of gignatic hills."

After mentioning all the principal features of the island in a picturesque point of view, the author proceeds with an elaborate and entertaining review of its natural history. On page 117, after observing that the Bearberry (Arbutus-Uvaursi), is common in Arran and blooms in April, he states that

"Later in the season the moorland is adorned by the very beautiful Milkwort (Polygala vulgaria), resembling a little dark blue humming-bird with expanded wings; the bright golden Potentilla (P. Tormentilla), beautifully contrasting in colour with the Milkwort; the graceful Orchis (Orchis maculata) of spetted leaf, and with flower both spotted and streaked; Gyunnadenes consesses of rose purple has and delicieus fragrance; the tapezing spike of yellow, star-like Bog Asphodel; and the bine clastering heads of Jasions montana; while the whole is one mass of bloom with the Heather or Ling (Calluna vulgaria); and the Cross-laved or Cluster, and the Fine-leaved or Purple Heaths, or Bell-Heathers (Erica tetralix and E. cinerea)."

We might give many more equally instructive and pleasing extracts, for there is scarcely a page that does not contain some excellent passages that are well worthy of notice. However, we confidently recommend this work to all who desire a really enjoyable and instructive book, as one that combines pleasant reading with scientific ascuracy without undue technicalities. The volume contains a complete list of the plants, also copious lists of birds, insects, fishes, and melluses found in the island and the water contiguous.

HOW I SAVED MY CROP OF STRAWBERRIES.

In previous seasons I have found that the most useful protection for the fruit was those wraps of straw stitched together which wine merchants call bottle envelopes. I employed an abundant supply for my Strawberry plants this year, for I had found them most useful, because they can be placed fist or edgeways, and are good traps for slugs and anails; but a month ago my Strawberries were besten down to the ground by the heavy falls of rain, and were simply decaying as they riperad. I found my remedy in employing plasterers laths. Two laths were tied together; short stakes about a foot to 18 inches above ground were inserted at intervals. The lath was placed under the fruit and tied to the stakes, and the fruit was supported from the ground. Next season I intend to place the supporting laths to my Strawberry plants when they are in bloom, so that when the fruit sets it may rest on the laths. I have no hesitation in saying that without the above I absult have had no crop, and that the result has been very satisfactory to—G. O. S.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Sow seed of Cauliflowers in an open situation rather thinly, but in sufficient quantity to afford plants for pricking-off into frames and under handlights in October. Dwarf Erfurt Mammoth, Early London, and Walcheren are thoroughly reliable varieties. A sowing of Lettuces to afford plants for early spring use must now be made either where the plants are to remain, in which case the ground-must be firm in a sheltered situation, or in beds rather thinly to admit of their being planted out in Octobes. Brown of

Bath Black-seeded is an invaluable variety, being very hardy. Bath or Brown Sugarloaf and Hick's Hardy White are fine for this sowing, and of Cabbage varieties Stanstead Park, All-the-Year-Round, and Hammersmith Hardy Green are good. Radishes will require to be sown about every three weeks, and none are finer than the Olive-shaped, especially French Breakfast, and the Turnip varieties. The winter kinds, of which China Rose is far Turnip varieties. The winter kinds, of which China Rose is far the best, should also be sown at once, also Black Spanish and Californian Mammoth. They require rich deep soil and must not be sown too thickly. There must not be any further delay in the last sowing of Onions, the Queen being very useful on account of coming in long before any of the Tripolis. Sow also Carrots and Winter Spinach. Plant out successional crops of Lettuced and Plant out successional crops of Lettuced as the plants will probable the first ground at the plants will probable. and Endive, preferably in firm ground, as the plants will probably be required for lifting and placing in pits or frames for protection be required for lifting and placing in pits or frames for protection in hard weather. Turnips of the early varieties may yet be sown. Finnt out a good breadth of Coleworts at once, and any young healthy plants of Cauliflowers may be planted; if on good ground and well attended to they prove very useful if the early winter be mild. Kales and other winter and spring Greens may yet be planted, also Broccolis if ground has not become vacant before, moving them, however, with balls and watering them until established. Artichokes which have been two or three years on the removed will have ceased bearing and should be removed. Where ground will have ceased bearing and should be removed. Where young plants were planted early in spring these will soon afford heads and also give a good early one property with the state of the state young suckers for planting next spring. If the old roots are retained useless stems should be removed and all decayed leaves. retained uscless stems should be removed and all decayed leaves. If the weather be dry a few good soakings of liquid manure along the rows of Runner and Dwarf Kidney Beans, also late Peas, will help them considerably, and if the same attention be given to Asparagus and Seakale the heads will be correspondingly finer in the ensuing season. Choose dry days for earthing up Celery, affording liquid manure liberally to this crop if the weather prove at all dry. Keep up a supply of small caleds by frequent sowings. Cut off a good supply of herbs, such as Basil, Sweet Marjorams, Sunser Savory, Mint, Thyme, Sage, &c., placing them under cover to dry for winter use.

HARDY FRUIT GARDEN. HARDY FRUIT GARDEN.

In consequence of heavy sains, and to some extent scantiness of even, fruit trees have required more than usual attention in stopping. This more particularly applies to bush, pyramid, and espalier trees which have not yet ceased growing. There must not be any delay in stopping the growths to one leaf, unless the shoots show at 2 or 3 inches growth a plump terminal bud, which most fikely will turn out to be a fruit bud; at least such short study shoots are those most wanted, and under no circumstances about they be removed. Apricots have cast much of the fruit in stoning, also Peaches and Nectarines, which proves that the wood was imperfectly ripened in the previous season. The forerights was imperfectly ripened in the previous season. The forerights of Apricots should be kept closely stopped or altogether removed, keying in the wood somewhat thinly and the spurs not too crowded, all as close to the wall as possible. Peaches and Nectarines will ripen the wood best if the shoots are trained in rather thinly, cutting out any gross growths, and stopping any that are disposed to grow too long and too vigorously. Over-luxuriant Peach and Nectarine trees are best brought into a fruitful state by lifting. retarns against walls should have the growths closely stepped to one leaf, and any strong forerights are best cut away. Those on the free stock very often make much breastwood, particularly when the space allotted to the branches is somewhat limited, and when the space allotted to the branches is somewhat limited, and as the trees do not lift well, ringing the branches should be reserved to preferably to root-pruning. Those on the dwarfing stock lift freely and safely, any undue hururhance being checked by judicious lifting or root-pruning. Similar remarks apply to Apples, any trees of which growing too vigorously should be marked for moving as soon as the leaves commence falling. Plum trees against wells also make much breestwood and are not as not a Plum trees against walls also make much breastwood, and are unfruitful; root-pruning will check their vigour and induce fruitfulness. Chernies, if a secondary growth be made, must be closely strenged, laying in the young wood of Morellos somewhat thickly, so as to take the place of these shoots that may be removed after the fruit is gathered. Those about to plant new trees near walls

success to repeated funigation with tobacco paper; taking care not to give an overdose, to have the foliage dry, and ventilate rather freely the following day.

Meions.—It is presumed that the last batch of plants have been planted out; if not, it must be done without delay. Preserve the leading shoot till it reaches the trellis, when it may be stopped. Remove every alternate lateral directly they can be nipped out, maintaining a warm and moist atmosphere. The last batch in pits and frames have set the fruit very indifferently, it being next to impossible to secure a dry atmosphere even with linings and free ventilation. Earth-up the roots directly the fruit begins to swell, and the weather being dull diminish watering, although in bright weather conjous supplies will be necessary. Keep the swell, and the weather being dull diminish watering, although in bright weather copious supplies will be necessary. Keep the growths fairly thin, and examine frequently for canker at the collar, which is caused by an excess of moisture, and may be subdued by placing lime around the affected parta. Gradually withhold water at the roots and moisture in the atmosphere from plants ripening fruit, and if a little extra heat be given so as to admit of free ventilation the quality of the fruit will be enhanced constituently.

PLANT MOUSES. PLANT MOUSES.
Stoce.—The earliest batch of antum and winter-diowering plants, such as Poinsetties, Buphorbia jacquinismfors, Eranthemum pulehellum, Thysecanthus ratilians, Plansbago coccines saperba, Centropogons, Sericographis Chiteshrephtiana, &c., will by this time have filled their pots with roots, but as it is not desirable to increase the size of pots weak liquid manure must be given occasionally to enable them to retain the bottom leaves in a healthy condition. The plants-should be-kept in a light house or pit near to the glass. Admit air freely by day, so as to induce short-jointed stout growth, with a little air at night to well ripen the wood. Later-struck plants must have encouragement by receiving every necessary attention to enable them to make

by receiving every necessary attention to enable them to make strong short-jointed growth.

Achimenes past their best are often crammed anywhere out of sight, where they are allowed to remain to ripen; the consequence is they form small weakly tubers or die altogether. Instead of is they form small weakly tubers or die altogether. Instead of this they should be kept in a temperature as warm as is essential to grow them in, with water sufficient to maintain them in health until the scale-like tabers are fully ripeaed and the leaves and stems gradually die down, in which condition they winter more safely and the growth and flowering is much better the following season. Obvainlas require similar treatment, affording water to keen the soil moist, with sufficient warmth and light until that season. Głoxinias require similar treatment, affording water to keep the soil moist, with sufficient warmth and light until the tubers are matured. Any varieties it may be desirable to increase may have the mature leaves taken off, inserting them in sandy peat and learn. Winter-flowering Begomas must not suffer through insufficient pot room, but be shifted into larger pots if necessary; but if this be undesirable weak liquid manure may be applied in a weakly state. Medinilla magnifica is an effective plant, but does not flower freely when grown in a hot and moist temperature. With drier treatment it flowers not only from the temperature. With drier treatment it flowers not only from the current season's growth but from the old wood. Bougainvilless and Olerodendrons with similar plants that have been in cooler to the coo quarters must be removed to the stove, but not to such warmth and moisture as to induce growth, but in a drier atmosphere affording water only to prevent the follage going off too speedily, the growth being gradually hardened. Exoras that have been employed in conservatories must be returned to the stove before they suffer injury from too low a temperature. Amazyllises will new be fast completing their growth; and although they bear a low temperature it is not advisable, as many of the finer, and especially the evergreen forms, do not flower freely when subjected to it. In a house or pit with an intermediate temperature they ripen the growth perfectly, it being important that they have plenty of light and air not only when the growth ceases but all through the course of its formation. The drying-off of these plants as often done is a mistake, the soil should never be so dry as to cause the destruction of the roots. and moisture as to induce growth, but in a drier atmosphere as to cause the destruction of the roots.

Orchieds.—Now that the sun has less power than it had earlier in the season the East India house must be kept moderately close and a growing atmosphese maintained. If the weather be dull the moisture must be reduced and recourse had to fire heat (which the fruit is gathered. Those about to plant new trees near walls should have borders prepared as soon as possible, so as to have the soil ameliorated before the time for plantage arrives, it being important that they be efficiently drained and the soil employed important that they be efficiently drained and the soil employed it will be advantageous to most fruit trees.

Cusumbers.—Encourage the plants for autumn fruiting to make a strong growth by adding fresh soil from time to time, affording plenty of water at the roots and moisture in the atmosphere, and institute in the atmosphere diagrowth well thinned, so as to encourage the growth of young bearing wood. The syringe should be regularly employed about 3,30 r.M., and if mildew appear dust with flowers of sulphur in the evening whilst the foliage is damp, maintaining a somewhat dry and freely ventilated atmosphere for a few days. Black aphilies are unusually troublesome; those and the green aphilies suspended to the roof they should be arranged over the pathsuspended to the root they should be arranged over the pathways or at the end of the houses, so that in watering or syringing the plants on the benches will not get the drip from those suspended. Calanthe masucs and C. veratrifolia may now be repotted, shaking them out if the soil has become sour, the rootabeing washed in tepid water, repotting in a compost of turfy loam and peat in equal parts, with a little decayed dung and some pieces of charcoal about the size of nuts.

TRADE CATALOGUES RECEIVED.

James Veitch & Sons, Boyal Exotic Nursery, King's Road, helsea.—Catalogue of Hyacinths and other Bulbous Plants.
William Paul & Son, Waltham Cross.—Catalogue of Bulbs.

TO CORRESPONDENTS.

_ All correspondence should be directed either to "The Editors" or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.
Rehibited Vegetables (M. W. Wicholson).—Kidney and round Potatoes exhibited as separate dishes would count as two varieties in a class entitled "tray of vegetables, ten varieties;" but had the stipulation been a "tray of vegetables, ten kinds," the two dishes of Potatoes would not have been admissible. Round and kidney Potatoes are certainly distinct varieties of a genus or kind, and must be accepted as such, otherwise Regulation 5 in the schedule enclosed becomes a misnomer. According to the schedule no one could disqualify an exhibitor if he staged two dishes, distinct varieties, of Lettuces, Peas, Beans, Onions—indeed, of any vegetables in the same tray, although that might not be in accordance with the views of those who drew up the schedule. If distinct kinds of vegetables were required, as is generally the case, the term "kinds" cought to have been employed; but as that term was not adopted an exhibitor has no right to suffer for the mistake or oversight of an official, and the two dishes of Potatoes referred to must count as two varieties. The term "varieties," as employed in many schedules, is very misleading, being perplexing to exhibitors, and occasionally placing competent judges in an unenviable position. The term in question is rightly employed in your schedule in Classes 8 ("six cut Roses, not less than three varieties") 18 (Antirrhinums), and 19 (Verbennss) similarly specified, because it relates to varieties of the several genera; but in Classes 26, 40, and 67 (trays of fruit and vegetables) the term "kinds" ought to have been employed unless you allow duplicate dishes of different kinds of fruit and vegetables in the collections. In important fruit schedules it is usual and very convenient to insert a special provise that black and white Grapes are allowed to count as two dishes in collections of say "eight dishes of fruit, distinct kinds," otherwise they would only co

very familiar and often misapplied terms—kinds and varieties.

PANSIES DYIM (E. H.).—The plants are prone to wither and die in some districts in the manner you describe, especially where the soil is light and shallow, and when planting has been done late in the spring. The only remedy we can suggest is heavier, deeper, and rather rich soil, healthy plants being procured and planted during fine weather in March. As they grow a covering of abort manure or occoa-nut fibre refuse spread on the surface of the bed is of great service, and small sticks or pegs should be employed to prevent the plants being twisted by the wind; many plants are lost every year by neglect of this simple precaution. If your garden is exposed possibly your loss may be attributed in some measure to the bolsterous winds that have prevailed during the present season, the plants not having been properly secured in the manner suggested.

SCHYCHYMAL COUNTRA (FRM)—Our mode of emitum is to turn the

SCHIZOSTYLIS COOMERA (Busy). — Our mode of culture is to turn the plants out of their pots in early spring and plant them in good soil in the garden. In the autumn they are taken up and potted, dividing the clumps if needed, but not separating the individual plants. Your plan of plunging the pots will answer provided you supply the plants with water as needed. We should not separate them now, but grow them on as you propose. A removal of a portion of the surface soil and an application of fresh compost would benefit the plants.

would benefit the plants.

Lillums in Bris (Idens).—Nearly all the species and varieties of this grand genus thrive in beds provided the site and soil are suitable. The site should be a sheltered one, but not under trees, and if not exposed to the full glare of the midday sun so much the better. The ground must be drained if needed, as stagnant water about the roots is fatal to the bulbs and plants. The soil must be deep and fertile. It should be made good to the depth of at least 2 feet. If it is naturally heavy incorporate with it sand or grit, if light add fresh sound loam. If manure is needed let it be well decayed. Leaf soil, burnt vegetable refuse, and peat are useful additions except when the soil is very light. Surface dressings of manure are beneficial, protecting the bulbs in winter, and also enriching the soil and conserving the moisture in the beds during summer. As to varieties, the most practical advice we can give is that you state your requirements to the firm you name, intimating the proposed size of your bed, the number of bulbs you require, or the outlay you are willing to incur, and you may rely on receiving the sorts best suited for your purpose. Your proposed plan of grouping the Irises is good; they will thrive well if the soil is moderately fertile, and will look well in the position suggested. The tubers or bulbs may remain in the ground from year to year, care being taken that they are not injured by digging.

Scentless Rosss (Dublis).—Your letter shall have our attention, and a

SCENTLESS ROSSS (Dublin).—Your letter shall have our attention, and a reply will be given in ample time for obtaining plants.

VARIOUS (W. D. H.).—The specimen resembles Sequoia (Taxodium) sempervirens, the Californian Redwood, but if the tree is deciduous it is probably a variety of Taxodium distichum. The name of the Tulip Tree is Liriodendron tulipifera. It is a native of North America, whence it was introduced in 1863. It is included in the natural order Magneliacese. Cistus ladaniferus, the Gum Cistus, is a native of Spain and the south of Europe.

SEEDLING VERBERAS (W. C., jem.).—The bright crimson lake variety with a yellowish white eye faintly tinged with violet is worth preserving, yet it is not superior to other varieties already in commerce. The lavender-coloured flower is much inferior to others of the same colour in cultivation.

STRAWBERRIES FOR WINTER (West Riding).—There is no great difficulty in producing ripe Strawberries in December. Mr. W. Bardney sent us some last year during the third week in December perfectly ripe and st to 4½ inches in circumference. These are referred to and Mr. Bardney mode of culture is detailed on page 462, No. 925, vol. xxxv. We recently to 44 inches in circumference. These are referred to ann air. Baruney's mode of culture is detailed on page 463, No. 935, vol. xxxv. We recently saw the plants at Norris Green intended for fruiting next winter, and they were just showing their flower trusses. The varieties grown for the purpose in question are Sir Harry and Vicomtesse Hericart de Thury (syn. Garibaldi). You had better read the article referred to. The number can be had on sending 34d. in postage stamps to the publisher.

on sending \$\frac{3}{2}d\). In postage stamps to the publisher.

Fig CULTURE (\$E_{0}\$),—As you have access to a file of the Journal you may by consulting the indexes attached find much matter relative to Fig culture. Mr. Taylor in an article on page \$77, No. \$14, vol. xxxi., says a great deal in a few words on the subject, and attributes his success to annual root-pruning and summer thinning of the shoots. Standard Fig trees only appear to succeed in certain localities; but Col. Trevor Clark in a paper read before the Royal Horticultural Society on March 5th, 1678, and of which a resume is given on page \$4, No. 884, vol. xxxiv. of this Journal, expressed his opinion that a Fig orchard intelligently menaged in the London district is an experiment well worthy of being tried. Your letter shall have further attention.

RAISING GLOBE ARTICHORES FROM SEED (J. Cuthbert).—Many plantations of these were killed last winter besides your own, and consequently
suckers are scarce. You can readily raise a stock of plants from seed. Had
you sown in spring the plants would have produced heads early next year.
We should sow now; and as it appears a matter of importance that heads be
produced as soon as possible, we should grow a few plants in pots and winter
them in a cool frame, plunging the pots in ashes. If these plants are planted
out in rich soil next March or April, according to the weather, they will
produce heads in the autumn when you appear to require them.

produce heads in the autumn when you appear to require them.

AUBIGULAS UKHEALTHY (A New Grosser).—Unless the plants are larger than any we have seen, the pots you have employed are too large. If we remember rightly neither Mr. Turner nor Mr. Douglas pot their largest plants in pots exceeding 8 inches in diameter at the top; indeed very few pots are used of that size. Auriculas dislike too much pot room, as the soil then is apt to lose its sweetness, when the plants inevitably turn yellow, as yours have dome, and decay. We should turn the plants out of the pots, removing a good portion of the soil from their roots and place them in smaller pots in which the roots will be a little cramped rather than otherwise. Simploy sweet turty loam with very little manural additions, and drain the pots well. Place them in a frame behind a building where the sun does not reach the plants for several hours during the hottest part of the day. Water carefully, and if insects appear dust the plants with tobacoo powder or small. By adopting this course of treatment promptly your plants will recover and flower freely next spring.

PRARS AND APPLE PITTED (L. I. K.).—The nitting has probably been

FEARS AND APPLE PITTED (L. I. K.).—The pitting has probably been caused by hall when the fruit was in a young and tender state. The rust we, in the absence of any data guiding us to a different conclusion, attribute to cold and wet soil. Your garden probably needs draining, and if the soil were enriched by surface dressings of manure the roots would be encouraged near the surface, and the trees would grow more healthily and the fruit swell more freely than is the case at present.

TRANSPLANTING BOX EDGING (H. E.).—You may safely remove Box edging in September, especially if the weather is dull and showery; if it is bright you must water the newly-planted edgings frequently, and if the slips are not well rooted it may be prudent also to shade them during the hottest period of the day.

PERENNIALS (J. S. M.).—The following will possibly meet your requiremenths:—Dianthus superbus, Campanula nobilis, Lychnis grandifors, Rudbeckia Neumanni, Spiresa filipendula flore-pleno, and Anemone japonica

alba.
GROWING MUSHROOMS (C. H. F.).—The bulk of the material must consist of horse droppings, with a little half-decayed stable litter intermined. A third of leaves may be added, and a tenth of leave, the whole being thoroughly mixed and pressed firmly into a bed from 9 inches to a foot in thickness. When the heat is declining, not rising, spawn may be inserted when the temperature of the bed is between 75° and 80°. Press lumps of spawn about the size of walnuts into the surface of the bed and about 8 inches apart. In about a week afterwards place on 2 inches of good leave and beat it very firmly. In about six weeks after that, if the bed and temperature are right and the spawn good, you may expect Mushrooms. You will find more copious notes by a successful cultivator in No. 883, vol. XXXIV.

persture are right and the spawn good, you may expect Mushrooms. You will find more copious notes by a successful cultivator in No.885, vol. xxiv. COTTAGERS' GREENHOUSE (A Cottager).—Had you stated the size of your greenhouse we should have been better able to have answered your letter. If the house is very small, say not more than 10 or 15 feet long, and of proportionate width, we think you are expecting too much. In such a house you cannot expect to grow many Cacumbers in addition to flowering plants. A propagating case such as you appear to need may be easily provided by forming a small frame over the warmest part of the flue, to be covered with one or more move the glass lights. If you place a sinc tay about 2 inches of cocca-nut fibre refuse, keeping the tray filled with water and the cocca refuse moist, you may strike cuttings and raise scallings without difficulty. A house for stove plants is made the same as one for greenhouse plants, but requires twice the extent of fine or hot-water-pipe surface to heat it. If you want to erect a house as cheaply as possible only the roof need be of glass, the sides or ends being of brick or stout boards. Wood is a night temperature of 65° can be easily maintained, would be well suited for growing Cucumbers and many kinds of stove plants. The Cucumbers should be trained to wires affixed about a foot from the glass. If you have a wall, a lean-to house will be much less coatly than a span-roofed structure, and will not require so much fuel to maintain the requisite heat.

AUBERGINES (F. A. B.).—The French people are extremely partial to these fruits, and the plant is extensively cultivated in Algiers, whence the majority of these fruits are imported to the English markets of Paris. Some are also grown in the south of France. The fruits are prepared in various ways, but the two following are most common:—Cust the fruit down the middle removing the seeds, then place the halves cut side downwards on a

gridium and cook over a clear fire. The other plan is to simply out the fruits across and across, and then cook in a frying pan, employing in both cases either Fiorence oil or butter, and flavouring according to taste. A catalogue of horticultural works may be had from Mr. W. Wesley, Bookseller, 28, Essex Street, Strand, London, by forwarding a stamp and stating that you require No. 36 of the Book Circular.

LERS you require NO. SO Of the HOOK UPCULAY.

CLIEBERS IR BOXES (J. H. S., Wellington),—If the plants are growing atthinatority, and there is no reason that they should not do so in boxes, you would not very unwisely by removing and placing them in pots. We do use understand what you mean by "planting Roses on or under the stage," miless you consider placing them in boxes "planting" them, in which case they would be probably better on the stage; but everything depends on the length of the stems. The foliage must have all the light possible, but light for the stocks or stems is not so essential.

possible, but light for the stocks or stems is not so essential.

CERTEANTHERMORE UNBATISPACTORY (J. E. C.).—If your object was to have dwarf bushly specimen plants the growths ought to have been pinched more frequently. It is too lake to stop them now. The leaves have fallen from the stems either in consequence of the plants having been crowded too cheely together, or by having been too dry at some time during growth. If you water them sufficiently yet carefully now, affording weak liquid measure occasionally, they may still produce good blooms; and if the plants when flowering are placed close together in the conservatory they will have a clearful effect, and their naked stems will be in a great measure hidden. By no possible treatment can fresh foliage be produced on the parts from which the leaves have fallen.

FINGULA FLORISUMNA UNHEALTHY (Idem).—Root-action is probably descrive. Turn the plants out of the pots and see that the drainage is efficient; remove 'as much of the old soil as you can without seriously injuring the roots, and apply a fresh compost of turly loam and peat, pressing it in the pots rather firmly, and place the plants close to the glass in a light greenhouse or frame. As rains are frequent the Heaths should now be placed in a very light and well-ventilated greenhouse, exercising great care in watering them, giving water copiously when it is required, and never in driblets.

and never in Griblets.

Inserts Off Plants (E, P).—The plants are very much intested with thirty, and would probably have been in a worse state had the summer been betsed dry. Resmove the worst leaves entirely and burn them, then syringe the plants thoroughly with a solution of Gishurst compound, 2 oss. dissolved in a gallon of water, or the same quantity of soft soap, adding to each gallon of the solution half a pint of tobacco water. Apply it in a warm state, say of a temperature of 100° or 100° . Place the plants on their sides on a mater sensething of the kind, so that in syringing them the soil does not become asturated with the solution. A little of it entering the soil will do no harm.

er sussishing of the kind, so that in syringing them the soil does not become saturated with the solution. A little of it entering the soil will do no harm. Harms of Plants (Di Do Dum).—We do not undertake the naming of varieties of Zonal Pelargoniums and other florists' flowers. Such flowers can only be correctly named by comparing them with the varieties in a very large collection of flowering plants. (J. P., Hanu).—1, Maxillaria venusta; 2, Cordyline australis; 3, We think it is Cassia corymbosa, but a flower is necessary for identification; 4, Hypericum perfoliatum. (R. G. W.).—All the flowers were shaken to pieces, and we can only judge by the foliage and your descriptions. 1, Appears to be a Bourbon; 2, an Austrian Briar; 3, a Moistete; and 4, a China Rose; 5, Is Cistus ladaniferus, the Gum Cistus; 7, Escallonia macrantha. (A. C.).—1, Deutzia crenata flore-pleno; 2, Lysimachia vulgaris; 3, Verbascum nigrum; 3, Listris pumilia; 6, Lenochhoe spinulom; 4, and 7, too withered to be recognisable; 3, Cassandra angustifolia. (Ameteur).—The numbers had slipped off the specimens, so that we cannot name them consecutively. The Crotons are—C. Weismanni (long narrow leaf), C. irregularis (long leaf, broad base), C. undulatus (leaf elliptical, spotted with red). The specimen with small variegated leaves is Peristrophe aspustifolia aureo-variegata. The remaining specimen is a Gesnera, probably 6, sebrina. (Thecedide).—Stachys Betonica. (M. M.).—1, Resembles an Orobus; 2, Probably Gnaphalium albescens; 3, Corydalis Intea; 4, Centranthus ruber; 5, Marchantia polymorpha. (A. H.).—Asphodelus ramosus; 2, Lysimachia thyrsifiora.

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

THE SUMMER GRAZING OF CATTLE. (Continued from page 137.)

When accommodation sheds are erected in a suitable and central position connected with a number of pastures, or with a large tract of pasture land as they may be, whether erected in single range of toxes or double range with a small path in the centre, we have found them extremely convenient, whether the cattle resort to them for shade or shelter only, or whether the animals are fed therein with an allowance of artificial food. It is also found convenient in summer time for dairy cows when the pastures are situated a considerable distance from the farm buildings, in which they may receive green fodder as supplementary to grass or cake, and they may also be milked in these sheltered boxes without having to travel far. We mention this to show that shelter cattle sheds are not recommended to be built solely for fatting cattle, but they may also be of use in the event of a change of system where a milking dairy may be required.

Our previous observations as to the system of buying cattle in the antumn for grazing in the following summer has the object in view of selling the animals fat at the best time. That is when they usually fetch the highest price per stone in the months of June and July, and when beef is probably more scarce in the

market than at any other time of the year, this being the period when the bullocks have been all sold out of the stalls and boxes when the bullocks have been all sold out or the stalls and noxes in Norfolk and the eastern counties, and too early for the general sale of bullocks fed in the grazing districts of the various counties where the animals are fattened chiefly upon grass alone. This shows the policy of buying cattle in antumn or early winter and forwarding them in condition in the straw yards, &c., so that they may be ready for the market at the earliest part of the season when grass-fed oxen are most wanted by the butchers. There is hardened that is hardened. when grass-red the relation occasionally adopted—that is, buying in lean animals or those forward in condition, the latter being the best practice in the early spring, and giving them a short course of feeding in the yards or boxes, thus acclimatising them and bringing them into fair condition for feeding in the pastures as soon as the grass is forward enough to maintain them. In this case, however, it is seldom that the whole of them can be forward enough for sale out of the pastures. Therefore, the practice is, where arable land is formed upon the farm, as soon as the grass begins to get weak and stale about the end of September or the early part of October, to give the animals a little artificial food before leaving the pastures; after that put them in boxes and feed them until Christmas, when they ought not only to be in first-rate condition but fetch the full price of Christmas beef in the market. As soon as they are put to root-feeding we must caution the feeder against giving them hay, because we have found that when the bullocks are fed well upon a full allowance of roots in conjunction with cake or meal, hay, especially if it is the produce of arable land or rich pastures, often upsets the diges-tive organs. We prefer to give straw or straw chaff instead, upon which feeding we never find them to refuse their food, as they otherwise would do when fed at the same time with liberal quantities of roots, cake, meal, &c. We have just stated that the bullocks which are not forward enough in the autumn for the butcher are often held on and fed for Christmas; however, in peculiar circumstances, such as an occupation without any arable land to fall back upon for root-feeding, the animals are frequently obliged to be offered for sale out of the pastures when the grass fails both in quantity and quality, which generally occurs early or late in the month of October, according to the soil and situation of the pastures. We must therefore call the attention of the home farmer who requires to buy in cattle in the autumn for winter feeding to the advantage of buying at that particular time animals which are just beneath the butchers' quality. They are frequently sold for what they will fetch, and we have known animals pay better for feeding when taken into stock under such circumstances than when bought or fed at other times or under other conditions. Indeed it is a common practice with butchers themselves where they happen to be the occupiers of arable land, to buy the bullocks forward in condition, and at that time feed them well up to Christmas for slaughter in their own business rather than trust to the usual time of purchase, when the butchers usually require fat cattle to supply their Christmas customers.

We have often noticed during our travels in the southern counties and west midland districts, and particularly in the counties of Devon and Somerset, and also in Buckinghamshire, Northampton-shire, Cheshire, and Warwickshire, especially in our visits to some shire, Cheshire, and Warwickshire, especially in our visite to some of the best grazing farms, including some in the Vale of Aylesbury in Bucks, that some portions of the grazing lands are only used as dairy land, whilst others are rich enough to feed and graze the animals without any assistance by artificial food. We have as cary mand, writer others are rice emough to feed and graze the animals without any assistance by artificial food. We have noticed also splendid herds of Hereford oxen, Devons, and latterly more Shorthorns are fed than formerly. It has been pleasing to see the number and superb condition of the cattle, the large enclosures, the richness of the grass, and the capital management of the district, which entitles it to be introduced here as an illustration of the rich grasing land to be found in management. tration of the rich grazing land to be found in many of the counties we have named. In some of the most extensive enclosures it is curious to notice the cattle and sheep; for herds of cattle and flocks of ewes, which have been purchased from dif-ferent fairs, lie and feed in company in different parts of the pasture. Many scores of gigantic oxen are sent to the Metro-politan Market from some of the largest farms, and it is most interesting to see the size and condition of some of the cattle. At the first purchase of such animals care must be taken to select those which show an aptitude to fatten and accumulate flesh rapidly. It is different now from when we first knew these rapidly. It is different now from when we first knew these districts; it was not then difficult to purchase ozen of a good age. Since the idea of early maturity and the feeding of "baby beef" has become fashionable four or five-years-old cattle cannot be readily obtained, and in many cases farmers are frequently obliged to take up two or three-years-old steers for feeding, or otherwise worked oxen or barren cows; both of the latter, however, pay worked oxen or barren cows; both of the latter, however, pay very well for grazing if they are well bred and in fresh condition at the time of purchase. The summer stock for some of the best grass land is a bullock and a sheep to an acre, and in some cases a ewe and a lamb and an ox can be maintained during the grass season; but it is of the utmost importance what breed of sheep are introduced to feed with the bullocks. We recommend the Leicester, Cotswold, or Lincoln breed, as they are each of quiet habit; and it must be understood that if any of the short-woo led

sheep of a roaming habit like the Downs and their crosses were

shbop of a reaming habit like the Downs and their crosses were kept in company with the bullocks, they would wander about the fields and tread the grass is such a manner as to make it unpalatable for the cattle. We mention this as being one of the important points in stocking the grass land districts.

Before concluding our subject we must refer to some rules to be observed both in buying and selling. It is never a good plan to buy cattle in low condition although they may be low in price, and it is necessary that they should be healthy, for sometimes cattle when in poor condition have disease lurking in them of some kind. When possible select the stock—that is, buy only the best anisals; and in case the home farmer is a beginner, rather than trust to his own judgment in selection it is well to the best animals; and in case the home farmer is a beginner, rather than trust to his own judgment in selection it is well to give a commission to a respectable agent who is in the habit of huying for other people. At the time of selling, if the home farmer has not sufficient experience to estimate the weight of his cattle by the use of his eye and his hand, it may be done by measurement. Taking the girth where it is smallest (close behind the shoulder), and the length of the animal from the front of the shoulder to the juncture of the tail, multiply the square of the girth in feet and inches by the length in feet, and multiply the product by 0.28, 0.24, 0.28, 0.28, or 0.80, according to the condition of the animal, and the result will give the weight in imperial stones. For instance, if the girth of an animal in moderate condition be 6 feet, the length 5 feet 4 inches, then $6 \times 6 = 36 \times 55 = 192 \times 0.24 = 46.08$; atoms; but this is still done by estimate econding to ordinary fatness or excessive fatness. The above is the live weight. There is, however, a rule with a slide like a rule seconding to ordinary fatness or excessive fatness. The above is the live weight. There is, however, a rule with a slide like a rule for timber measure to be had, which will save much time, and also prevent mistakes in calculation. When the live weight is ascertained as above, or by a weighing machine, well-brad cattle will give saleable meat, or carcase weight, from 60 to 70 per cent. of their live weight; if moderately fat 62 per cent. may be calculated on, or when excessively fat it may reach 68 per cent. or even 70 per cent.

WORK ON THE HOME FARM.

Herse Labour .- This must still be employed in tillage work, particularly upon the land which was intended for turnips. Much of this land in various districts has never been sown with crops of any kind on account of the very untoward season for fallowing. It will, therefore, now be well to allow such land to remain fallow until next spring, when it may be sown with barley or oas, applying a dressing of nitrate of soda. In the meantime, and at every opportunity when the weather is favourable, the land should be cross-ploughed. Unless it be foul with couch grass the rougher and more cloddy the ground remains the better, in order that the sun and wind may ameliorate the soil. It may remain thus until after the seed time for wheat; then upon the near approach of winter plough it up deeply into such sized ridges as the land may require. Allow it to remain in this condition until the seed time require. Allow it to remain in this condition that the seem and for Lent corn, when the first opportunity may be taken to drill the corn, as it will require no further ploughing and may be drilled with either barley or oats, the land being only scarified across before the drill. It will, however, depend much upon the across before the drill. It will, however, depend much upon the land, because if that happens to be free from couch grass, and the autumn should prove favourable as regards the weather, it may be drilled with wheat in October, and with a dressing of 2 cwt. of Peruvian guano at seed time and 1½ cwt. of nitrate of soda in the spring it will probably upon anything like wheat land produce a good crop. Where the next wheat is to be sown out of clover lea, as soon as the second crop of clover is removed or fed down by sheep the dung may be laid out and spread immediately. This work will serve to employ the horses at such times when they cannot work on the fallows, and after the dung is laid out and spread the sheep may continue to feed over the land, or the clover may be allowed to spring up until ploughed, as a fog of young grass when the land is properly ploughed and pressed will be an advantage to the wheat crop.

The odd horse may be employed in the interculture of root crops upon every opportunity when the land is dry enough for the horse hoe to work freely without clogging. It is, however, of the utmost importance that this horse-hoeing should be done whilst the weeds are in their infancy, because then they may die off although the weather may be showery. When the weeds are grown up so strong as to compete with the roots the only chance is to have them picked up by hand. This is, however, very tedious work, and can only be accomplished where the labour of women and boys is available. A large acreage of roots which was entirely smothered with weeds has this year been ploughed. An old tenant of ours said the other day that he had paid 20s. per acre in endeavouring to clean his mangold crop, and that it would still cost 30s. per acre more to complete it even if the weather proved fine; therefore, as the mangold plants seemed stunted in The odd horse may be employed in the interculture of root proved fine; therefore, as the mangold plants seemed stunted in their growth, he determined upon ploughing and resowing the land with common turnips as the best economy. It at present seems likely that the harvest must be the latest since the year 1816, in consequence of which the labour of the harvest will some what interfere with the tillage of the land in autumn after the crops are secured. Upon certain farms in the late districts it will this twofold purpose are Brahmas, Cochins, and Dominiques.

also interfere with the seed time and the preparations for wheat sowing, and thus it looks at present as if the difficulties of the present adverse season would be extended into the next year.

present adverse season would be extended into the next year.

Hand Labour.—Both men and women may now be employed in clipping the white thorn and other fences, and all this kind of work cannot be delayed with advantage. The work of trimming is easier for the werkpeople and better for the fences, as the young wood may be cut more closely than when the trimming is deferred until after havens and the wood become hard. Rape and mustant the fences are the fences as the same of the fences are the fences as the same of the fences are the fences are the fences are the fences and mustant the fences are the f until after harvest and the wood become hard. Rape and mustard may still be sown, the former for feeding sheep-upon dry healthy land; but upon heavier soils mustard will come quicker; and may eventually be ploughed in and pressed as manure for the wheat crop, should the weather continue too wet for folding with sheep. Mustard answers a good purpose to fold-off with ewes when the rame are running with them, for we have found that either rape or mustard are well calculated to advance the ewes in condition. This is also an important point at lambing time, for where the ewes drop their lambs well together it proves best in aware way for those who have to attend to them. There in every way for those who have to attend to them, are various means which may be adopted to lessen the labour at harvest time by anticipating the requirements of the harvest. Should the weather prove adverse faggots may be carried to the field for making staddles to build the ricks upon, and also to have straw drawn in readiness for thatching. It will be more important than usual to have the ricks of corn built in the field, as a given acreage of produce can their be secured against adverse weather in the least time. Especially is it necessary to be pro-vided with sail cloths for covering the ricks if rain occur whilst building or before they are thatched. We approve of building corn ricks round instead of oblong, as taking less thatch to protect them, and as presenting less outside to the weather.

POULTRY FARMING.-No. 5.

THE general management of poultry bred for profit on a large scale is a serious matter. We know well from experience that the methodical direction of a number of runs kept for pleasure, and only so far for profit that they are expected to be self-supporting, take much time and attention, far more than is conceivable to those who have not tried it. Where, however, profit is to be the first consideration this attention will have to be the more unremitting. The hints which we shall give for it are, as in our other articles on the subject, taken from a régime on a smaller scale. This must be borne in mind as before. There are of course two distinct branches of the occupation—the production of eggs and that of chickens, and anyone who embarks upon it must first make up his mind to which of these he wishes chiefly to devote his attention. A poultry farm, however, on a large scale would hardly deserve the name of such if it did not afford both eggs and chickens. Whether the one branch or the other should take the first place must depend upon the facilities for disposing of the product and on the

proximity of markets.

We will first touch upon the production of eggs. It is of course of the highest importance to get the greatest number of these for which there is demand at the time of year when they are dearest, for everyone knows that in January and February fresh eggs fetch for everyone knows that in January and February fresh eggs fetch three times the prices that they do in July and August. It is also of importance to have a continuous supply of them all the year round, so that they may never fail to satisfy the demand of any regular market. A large portion of them should be produced by non-sitting hens. Some varieties of these certainly lay a greater number of eggs in the year than those of any sitting breeds we know. It is true that they seem to wear out earlier; but this does not matter, for we should never advise keeping old hens in an establishment for profit. They save much time and trouble too, for the constant turning-off of broody hens from their nests and preventing them sitting during the hot months while the desire preventing them sitting during the hot months while the desire of incubation frequently recurs is most troublesome. What varie-ties, then, do we recommend? Hamburghs are unsurpassed for the ties, then, do we recommend? Hamburghs are unsurpassed for the number of their eggs, but these are too small for market. Polish are good layers, but not sufficiently hardy to be kept in large numbers. We should recommend Houdans, Leghorns, and Minorcas. An intelligent person will discover in two or three years which breed suits the place, the soil and circumstances best, but to begin with we should suggest that these three breeds be tried. Houdans are the hardiest race and the heat layers of the French Houdans are the hardiest race and the best layers of the French breeds that we have tried; they have the further advantage of being excellent birds for the table, which many of the non-sitting varieties are not. Leghorns and Minorcas are both great layers of very large eggs for their size. They are evidently related and sub-varieties of one race, which we should call the fowl of the Mediterranean. Birds of more or less purity resembling the Leg-horns are found throughout Italy, and birds of the Minorca type throughout the Spanish Peninsula. As producers, however, of eggs in winter these breeds may be surpassed, and as chickens are also to be reared there must be mothers to rear them. It so happens that some of the best sitters and mothers are also the

Of these from experience we should certainly give the palm to Cochine as winter layers, but some strains of Brahmas come very near them. Deminiques we have not tried, but we hear on ex-cellent authority that they are wonderful layers as well as good sitters; the latter merit surprises us, as they are evidently related to Leghorns.

In a large establishment the various breeds should certainly be apt apart, and a strict account kept of the number of hens in such exclosure from day to day and of the number of segs laid by them, it will then be easy to compare their excellence. Too hanty inferences must not be drawn, but two or three seasons should be taken for these comparisons if there is any idea of rejecting a breed entirely; or of substituting one for another. An observing person who is enthusiastic and sanguine of success should mark particular hens which lay peculiarly early or well, or especially fine eggs; these qualities are almost always transmitted to their progeny, and we are sure that peculiarly profitable races might soon be thus established by the selection of such birds alone for breeding stock. Much time and incessant attention have been given to breeding birds up to great size and weight, or to particular fancy points; but as far as we know no one has as yet taken the slightest pains to get a race improved in such improveable and valuable qualities. For the production of both eggs and chickens we strongly advise that pure-bred birds be alone bought at first; from these we should certainly try various crosses for both ends. But no beginners should try mongres, it is so seldom possible to trace their ancestry or to calculate upon their particular points of excellence. The different reeds being divided as we advise, those runs occupied by non-siting hens will of course be required all through the season. Where, however, there are a flock of sitters together we should allow the whole of them to sit; there will then be a spare run either for some of them with their chiekens or for other birds, or the ground may be left to freshen up. Such methodical arrangements save much time and space too.

In starting, then, we should divide our stock of laying hens to two classes—the sitters and the non-sitters—about equal in numbers. We should begin with none but pullets, and put about forty into each run of the size we have advised. It would be a forty into each run of the size we have advised. It would be a question with us whether to give any cocks at all to those hens destined to produce eggs for use alone. We fancy that hens are happier and more contented with them, and so should be inclined to allot a single male bird to each run; of course for breeding purposes this would be next to useless. It would be very desir-

purposes this would be next to useless. It would be very desirable to make careful experiments, which we have never had the opportunity of doing, to discover whether the presence of a lord of the harem has any effect upon the number of eggs laid.

We must newcome to the other branch of the business to be done—vix, the production of chickens. Of course the arrangements of the breeding birds will be very different; the breeds, too, which we shall recommend are different, for some of the very best laying varieties are not famous as table fowls. As with the layers, we shall only point out a few of the breeds which we have found to the the most excellent for the purpose and creases of which we be the most excellent for the purpose and crosses of which we sprove. The poultry farmer must compare them for himself, weigh the chickens at different ages, and above all discover which weigh the chickens at different ages, and above all discover which are most approved in the markets and consequently fetch the highest prices. Headens are a handy breed wish plump breasts; they develope rapidly, and have the advantage, as we have already said, of being good layers. We recommend them for early broods; the cockerels will come in as spring chickens, while the pullets can be saved for axisuan layers. Creves are not so hardy, but splendid birds and suitable for special fatting-up as capons. Dorkings are of course the table fowl per excellence, and cannot be surrossed as such though the chickens are not outse so easily be surpassed as such, though the chickens are not quite so easily re surpassed as such, though the chickens are not quite so easily reared as some kinds. They are (st least good strains of them are) capital layers too, and we should be inclined to add them to our list of egg-producers which sit. Then for crosses Brahma bens with a Dorking cock are useful; they will be among the earliest layers, and their cross-bred produce will stand the most inclement season and grow apace, so as to be ready for the earliest spring. All can be killed, or the pullets saved for laying and sitting, for both which purposes they are good.

both which purposes they are good.

Some Dorking hens with a Game cook will give a hardy and meet palatable race. How are these breeding birds to be arranged? Certainly not like those which are merely egg-producers—viz., in troops of forty. A cock and six hens, or through the summer ten, should occupy the same sized run as the forty layers. This may seem an extravagance and waste of space, but it is not so. ing birds require freedom and comfort to ensure strength in their produce. They must be selected with great care, not as to fancy points, but with regard to all the indications of health and vigour -straight legs, bright combs, strong tight plumage, vivacity of demeanour, and, when pains have been taken to ascertain such minutise, for their individual excellence as layers or mothers. As a rule the cock should be from the months to twenty months old, the kens from one to two and a half years. From a pen so selected and so separated every egg must be saved. Where hundreds of chickens are to be reared from one such family it is well worth while to take pains to ensure their produce being first-rate.

We are already outrunning the space which we had thought would be sufficient to conclude the subject, and so must reserve a few more hints on general management, which we should be sorry to omit, for one more article.-C.

VARIETIES.

THE harvest in America is, according to the *Prairie Farmer*, likely to be an unusually bountiful one. In Michigan the yield of wheat is estimated at upwards of 81,000,000 bushels, Indiana between 40,000,000 and 50,000,000 bushels, an unprecedented quantity for that State; Minnesota 45,000,000 bushels, and Illinois 80,000,000 bushels. In the south the prospects are equally good, and a satisfactory yield is anticipated in California. Last year the total American yield of wheat was 420,128,400 bushels, an amount which will be greatly exceeded this year. It has been computed that Europe will need 800,000,000 bushels of wheat for next year's consumption, the share of Great Britain THE harvest in America is, according to the Prairie Farmer, wheat for next year's consumption, the share of Great Britain being estimated at 117,000,000 bushels. In consequence of the unsatisfactory prospects of the harvest in Europe it is expected that prices will be well maintained; but it is something to know that there will be bread enough for all.

NEW VARIETIES OF WHEAT.—We are informed that the Royal Agricultural Society has decided to offer two prizes of £25 and £10 each for new and distinct varieties of wheat which shall combine the largest yield of grain and straw per acre with approved form and size, smooth and thin skin, full and white kernel, and high specific gravity in the seed, and with bright, firm, and stiff straw. One sack must be delivered to the Society by each competitor, together with a sample bundle of straw, before the 1st October next. A portion of each sample will be before the 1st October next. A portion of each sample will be kept for comparison; and the remainder, divided into equal portions, will be cultivated next year in four localities differing in respect of soil and climate. The prizes will be awarded for the best varieties of the crop of 1880 thus cultivated under the Society's auspices, if in the opinion of the Judges they possess qualities which entitle them to distinction. The produce of the experimental crop of 1880 will be the property of the Society, and will be offered first to the competitors who submitted the seed. The Society also offer prizes of £25 and £10 for new and seed. The Society also offer prizes of £25 and £10 for new and improved varieties of wheat upon the same conditions as those enumerated before, except that the sample sacks shall be delivered by October, 1862, thus giving time for the development of an uniform and permanent variety.

HARVESTING HONEY-CLEARING BEES FROM SUPERS AND SECTIONS.

THE year 1879 is likely long to be remembered by bee-keepers as one of the worst we have during several decades experienced in England, and yet where stocks have been kept strong by systematic aid perseveringly given, in some localities at least, during smatches of fine weather supers have been rapidly filled, sealed, and removed in first-rate order. Around London we know from and removed in instrate order. Around London we know from experience that the limes yielded abundantly during the last days of July, and those have not been wholly disappointed who felt that leaving the bees to starve was the worst kind of economy, while feeding after bad days (and this means unhappily almost nightly) was in all probability to be rewarded by returns very much higher than cent. per cent. The results of the year up to much higher than cent. per cent. The results of the year up to the present, as a whole, are sad indeed; but so singularly unequal has been the behaviour of the sky, that districts not far removed from each other tell totally different tales. For the most part where heather is not within reach honey-gathering, except in such small quantities that nothing can be added to supers, may be said to be at an end; clover, even where it has not fallen before the soythe, hardly at this late date making an exception. Where supers have been obtained it is desirable that they should be sither removed at one or exceptible watched lest the honest them. either removed at once or exrefully watched, lest the honey they

contain should be carried down by the bees into the stock hive.

In commencing this work of removal the bees always allow those cells that have received their airtight caps of wax to remain intact, deporting at first the unscaled honey only; and as sealing usually proceeds more sluggishly on the outside than the inside combs, we have the advantage in watching there of having under view the very cells likely first to be relieved of their coveted barden. Taking a peep at the bees by raising the jacket, so essential as a heat-preserver, we perhaps note that the unscaled cells at a corner of a comb previously known to be glistening with the nectar, which half filled them, are now empty, and at once determine to appropriate as our rightful share of Nature's bounty that which remains. We are thus brought face to face with the problem which so often prompts the queries—How shall I take my honey? How shall I get the bees out of the supers? In reply to these let me offer a few words of explanation, which I thope will soon show that, at any rate in such a season as this, it is easier to induce the tenants to depart than it has been in most cases to get them to take possession. If the supers have no bottom board it will be necessary to cautiously raise one corner

sufficiently to pass beneath it a very fine wire, the ends of which had better be fastened round sticks of wood to act as handles. This must now be drawn backwards and forwards and beneath This must now be drawn backwards and forwards and beneath the supers to cut, not drag, the comb from its attachments beneath. The separation being effected puffs of smoke should be blown in beneath the super, or preferably between its lid and side, if its construction admit of this. The bees will in considerable numbers retreat below, while those that remain will be of service in lapping up the honey set at liberty by the wire saw. Bar supers may be turned up at once on the hive top so that their combs stand in perpendicular lines, in which position they will sustain no damage, and smoke applied above will quickly send almost every bee rushing downwards to join those they now hear noisily buzzing within the hive (for bees certainly hear, Sir John Lubbock's violin notwithstanding, about which I want to say a word at another time). In this way the young bees are saved that have never flown, and of these a good number is often found above; a dusting brush will whisk off the rest as the super is carried away. I have tried goose wing and thin light brushes for this work, but nothing is comparable to the painter's duster; a bee scarcely ever gets between the hairs of it, while the poor insects are always driven before its gentle violence, and at once completely removed. It must not be used nervously, but the ends of the hairs must be made to pass as rapidly as possible over the combs. This method will not suit large glass supers, or any in which the weight and irregularity of the combs make it desirable that they should not be tilted, for we must not forget that a super at the time of its removal is warm, and consequently extremely ping up the honey set at liberty by the wire saw. Bar supers

the time of its removal is warm, and consequently extremely tender. In these cases we may often with great advantage wrap a wet cloth around the whole some hours before the removal is attempted. The falling temperature quickly checks evaporation of new honey and secretion of wax, while the small intercomb spaces become most uncomfortable quarters for the little labourers, that in consequence decamp almost bodily to the brood nest, where their presence is made necessary as we are cooling down this part of the hive also by our evaporating cloth above. The cooled and therefore toughened super may now be propped up on wedges so as to admit of small quantities of smoke to drive away further detachments of the quasi owners, no great number of which would now remain. A lidless box stood in a shady place having two or three slats of wood lying on the bottom of it will now be of service; on to these the super in sits is put while the sides are darkened by a cover; a cloth is thrown over the box to prevent the attentions of robbers, and the bees within coming to the light crawl on to the under side of the cloth, which is turned over at intervals so that the bees within are put outside. My five-pin trap, which is now so generally known that it hardly requires description, often much assists. It may be variously applied, and is made by boring holes 1-inch in diameter in wooden applied, and is made by boring holes 4-inch in diameter in wooden slips, and fixing two common dress pins over each hole, and two in like manner beneath, with space in each case for a fifth pin to hang between, held from dropping through by its head resting on the upper pair of pins. The hanging pin stands necessarily over the hole, and while it can be pushed up by a retreating bee prevents any from gaining admission from without. I have used a tray should place deep with five or six of these trays not the second of these trays hour 2 inches deep with five or six of these trays or the second of these trays of these trays or the second of the a tray about 2 inches deep with five or six of these traps on its side for some years. The super rests upon its—i.e., the tray's edges, so that the only egress is through the trap, and without

in the "British Bee Journal" a new bee trap announced.

"We are indebted to Mr. B. W. T. Braddy of Kelvedon, Essex," says the Editor, "for a suggestion which will be valuable to those who have supers to empty of their bees. It is no more or less than a tube of perforated zinc 6 inches long, inserted into the super, through which the bees may escape. The tube sticks out of the super, and the bees after passing through it do not attempt to return by the same route, but cling round its point of insertion into the super. It is described as most effective, and its inventor has such confidence in it that he leaves his supers or nadirs for whole days, feeling assured that no bee will gain re-admittance. whole days, feeling assured that no bee will gain re-admittance. The suggestion is valuable, and experiments made here long since quite corroborate what is said of it. But it is a mistake to suppose this form of trap to be new. Those who have the 'Handy Book of Bees' will see that Mr. Pettigrew at page 4 says, 'Some twenty-five years ago we caused a hive to rear a queen in the month of September after all its drones had been killed.' This was done with a view to ascertain how many days she left her hirs to find a with a view to ascertain how many days she left her hive to find a companion. The mouth of the hive was shut, so that every bee going out had to pass through a narrow tube projecting 2 or 8 inches before it took wing. Though the way out was plain and easy neither the queen nor bees ever found their way back through the tube."

But to return. The removal of sections, now growing happily so common amongst English bee-keepers, is far easier work than the removal of supers. I usually manage as below, losing scarcely a bee during the operation. The sections being opened a puff or two of smoke will expose a sufficient surface of comb to enable one to determine at once which boxes are fit for appropriation. These are raised, the bees on their under sides whisked off with the before mentioned duster and placed in a tray at hand. The plundering over, a cloth is thrown over the sections,

when new boxes are added or the remaining ones drawn together as the case may be, and the hive above made snug. The sections of unicomb will hardly need further attention, but should many bees be clinging about them they are brought singly to the hive door and one corner placed on the alighting board. The hum within attracts, and the smoke again applied drives towards the entrance, and in a few seconds we are left in undisturbed possession, for the two or three inevitable stragglers may be dislodged by a puff from the lips when the work is done. That circumstances alter cases will be always true, and where intelligence rules rather than routine, plans will never be stereotyped, but these suggestions than routine, plans will never be stereotyped, but these suggestions will I hope enable the amateur to shape his course so as to secure his honey with little loss of time or bees.—F. CHESHIRE, Avenue House, Acton, W.

OUR LETTER BOX.

CONDEMNED BEES (E. C., Surrey).—You can work two or three stocks of condemned bees into a strong colony. Having put them together feed them constantly until they have made 20 lbs., or better 28 lbs. in weight, in addition to their hive. Foundations are an advantage, but simple guides will be sufficient in the frame hive, and these indeed, since you have little experience, will be less likely to give you difficulties. Old comb is not necessary nor even desirable, as condemned bees usually build all worker cells. The wax for these combs, as you probably know, will be developed from the syrup given them. We hesitate to recommend hives, but the one mentioned in our last issue as receiving the prize at Birmingham will probably suit you.

REMARKS

13th.—Very close, calm cloudy day; slight rain 10 P.M. 14th.—Fine bright hot morning; overcast at 1 P.M. till 3 P.M.; calm fine

Dull in early morning, afterwards fine bright day.

-Dull in early morning, atterwards one origin day.

Showery morning; fine afternoon and evening; starlight night.

Dull morning; rain commenced at 7.30 A.M. and continued, with squally wind, the whole day; for a short time at 5.30 P.M. the sky became clearer; in the evening the rain was slighter, but heavy again at 10 P.M.

Rain in early morning; rest of the day fine, bright, and cool.

White mist in morning; very dull gloomy day, with rain, which increased during the after part of the day, and became heavy at

night.

Rarly part of the week fine and warm, latter part excessively wet.

G. J. Symons.

COVENT GARDEN MARKET .- AUGUST 20.

WE are now at the finish of the soft fruit, and prices for what samples are coming have much improved. Hothouse goods are in fair demand owing to the short supply of outdoor fruit. Trade better. FRUIT.

From observations taken near London during forty-three years, the average day temperature of the week is 71.9°; and its night

SOME LESSONS OF THE YEAR.

LOOMY, cold, and wet have been the days, weeks, and months of the summer that is now swiftly drawing to a close. Bright sunshine has become so great a rarity that a sunny day is now regarded as an event to be talked about and treasured in the memory. Weeds rampant, fruit flavourless, vegetable

dwarfs become vegetable giants; suails, slugs, and insects generally so abundant that birds hardly touch the fruit. An abnormal season of so pronounced a type that its effects upon vegetation for good or evil are everywhere visible in so clear and mmistakeable a manner as to afford us a valuable insight into the cause of many a failure—aye, and of many a

Nor does this valuable experience constitute all the silver lining of the cloud, for some of us at any rate can point to a very bright and pleasant contrast to the gloom. Ask the resarian, and he will tell you that never have his Roses been better in size, form, colour, and abundance; the fruit-grower, whose Grape Vines are planted in shallow well-drained borders, can point to a heavy crop of fruit of largest size and richest colour; the flower gardener to foliage of wonderful vigour and freshness among the numerous tropical plants grown during the summer months in many a sheltered spot in the open air; the vegetable grower, after a faint grumble about weeds and a louder one about Potato disease, must acknowledge a bountiful supply of succulent vegetables, his chief difficulty having been to confine the rampant growth within due bounds; and the forester has such vigorous growth in all his shrubs and trees that more than atones for the ravages of the severe cold of last winter.

Thus much of this remarkable season generally. Now let us turn our attention somewhat more closely to certain details. Shanking and mildew will no doubt be prevalent among the fruit of Vines growing in deep ill-drained borders; the crop from Vines growing in shallow soil thoroughly drained is, on the contrary, better than usual, the abundant fruit being remarkable for its size and colour, thus serving to enforce advice often given in these pages and of such great importance that it cannot be repeated too frequently— Keep the roots from contact with a cold sodden subsoil by means of an impenetrable concrete mass of lime and rubble; make the soil as rich as you would for the growth of vegetables, mixing enough of hard or gritty matter among it to afford a quick passage for water after it becomes compact; it should not be deeper than 2 feet, and have sufficient 2-inch drain-pipes beneath it to carry off all superfluous moisture. Such a border ought never to have any digging or disturbance of any kind, an annual top-dressing of rich manure and abundant waterings in a dry summer being all that are necessary. How abundant and frequent such waterings should be the present summer has shown unmistakeably.

: Cherries, Apples, and Plums after blooming profusely I find no blight upon it; it also blooms freely and thrives shed the embryo fruit so much that with but few exceptions | in an air which to very many others proves fatal. I wish

the crop is a failure. Cold and wet was the cause; and I may usefully note that of Apples which have withstood the baneful effects of this untimely weather and have a fair crop of fruit, there are Keswick Codlin, Nelson's Codlin, New Hawthornden, Cellini, Duchess of Oldenburg, Warner's King, Small's Admirable, Northern Greening, Yorkshire Greening, and Bedfordshire Foundling, all sorts of proved merit, and which it is satisfactory to know are to be found in most gardens. Of Plums, Coe's Golden Drop, Victoria, and Cluster Damson are the only varieties with a crop of fruit among some thirty others. Pears generally upon walls irrespective of aspect have so good a crop that it could serve no useful purpose to enumerate them.

Soil left undrained or badly cultivated has been in lamentable plight. Here Nature has enforced our teaching in a stern and unmistakeable manner. Drainage and mechanical division are two prime factors in the reclamation of soils of a cold, heavy, or very adhesive nature, and are to be regarded as equally necessary, for drainage alone is clearly insufficient. For example, some six years ago a piece of land consisting chiefly of silica very finely divided and with a small proportion of clay was drained, trenched, and enriched with manure and planted with Gooseberry bushes, and subsequently hoed to keep down weeds, an annual surface-dressing of manure being employed; but no digging was done, nor was the soil disturbed in any way, the roots having spread and become interlaced. All went well till the present summer, which promised to be one of the most productive of seasons so far as these bushes were concerned, all of them having a full crop of fruit, yet quite two-thirds of them have died outright, owing to the soil having gradually assumed its original condition and become waterlogged, which never could have happened had there been a plentiful admixture of coal ashes or similar hard substance when it was trenched.—Edward Luckhurst.

ROSES FOR TOWNS.

I see that on page 136 "A Beginner" asks advice as to the Roses most suitable for a smoky district. May I, as an amateur who has learnt what he knows of Roses chiefly from the valuable articles that appear from time to time in the Journal of Horticulture, supplement the advice you give him by a few remarks? My experience has been gained entirely in a smoky district, and some of it has been of a bitter nature; but if under adverse circumstances the difficulty of growing the queen of flowers is increased, how infinitely greater is the triumph and the satisfaction when a few good blooms are produced! Of all men the Rosegrower must be one who works in earnest and is not easily discouraged, and this is especially so with the town Rosegrower.

In the list of Roses you have suggested to "A BEGINNER" you have omitted one which of all others I have found to resist the evil influence of smoke and to repay for trouble expended upon it—I mean Marquise de Castellane. This Rose may possibly not be so vigorous a grower as some others, but I find no blight upon it; it also blooms freely and thrives in an air which to very many others proves fatal. I wish

NO. 1618-VOL. LXU., OLD SERIES.

NO. 961-VOL XXXVIL, NEW SERIEF;

the growers of Roses near large towns would give us their experience more than they do; I for one am very grateful to "WYLD SAVAGE" and others for the advice they give us from time to time, but what I so often feel is that I want the advice of a man who has to combat with the same difficulties as I have to meet—impure air, the difficulties of obtaining manure, and the hundred and one other enemies which make it impossible for the town grower to have every and any Rose he likes in his collection. I am sure there are many in this position.

One or two other Roses I would recommend are Jules Margottin, Madame de Cambacères, Elizabeth Vigneron, Mrs. Bossanquet, and Cheshunt Hybrid. Of Charles Lefebvre I am suspicious, and with La France and Madame Victor Verdier I have not been successful—perhaps my own fault. Of the Roses which you mention in reply to "A BEGINNER" I have found Céline Forestier answer well, and next to Marquise de Castellane John Hopper seems the best, but how terribly he blights, and what constant attention he requires to keep away the caterpillars, which seem perfectly in love with him. Is this the experience of the giants who live in pure air (Devonshire, for instance), and can grow as many and what Roses they choose?

Of Tea Roses, in addition to Gloire de Dijon I would suggest Homère grown as a standard, not as a dwarf. And now what will be said of me if I say everything that is bad of Général Jacqueminot? Shall I bring down derision on my devoted head, or will any of the "town men" agree with me? Speaking from my own experience—and I know I am not quite alone—I say unhesitatingly that for growing near towns and in smoky districts the Général is useless. Will others give us their opinions on this point? To return to the Teas, will anyone tell me why my Gloire de Dijons refuse to bloom? They grow well and keep very clean, but until the end of the season they do not bloom. A nurseryman I complained to recently advised my leaving them entirely alone at the pruning season. I mean to try it.

One suggestion I must not omit for "A BEGINNER." This is to employ liquid manure. I believe the life of every towngrown Rose tree is necessarily short, we must therefore make it a merry one. Very few if any Roses can be grown even in comparatively impure air for more than, say, three years, but with judicious treatment they will do well for that time. Liquid manure is the best tonic, and it can easily be made. Nothing can be simpler than the following plan, for which I am indebted to the Journal. Procure an old cask; insert a tap about 2 inches from the bottom; about a foot above the tap fix a false bottom of perforated zinc and throw in some dung; fill up with rain water, and as you draw off the liquid manure keep filling up with water until all the goodness is extracted from the dung. Of course other ingredients may be added with advantage—soot for instance, which intensifies the colour of the foliage and blooms and is a good stimulant, each Rosegrower having faith in his own peculiar brew.

I should like on another occasion to say a few words about the stocks best suited to towns.—BICEPS.

[You certainly may do so; such practical notes as you can send are highly useful.—EDS.]

PRUNING AND CLEANING VINES.

THE season will soon be at hand for pruning and cleaning carly and successional Vines, which is work of much importance. The scraping which some Vines undergo leaves them bare of their natural covering, and does far more harm than good, as the exposure to which the inner bark is subjected causes it to become hard and contracted, which greatly impedes the growth and swelling of the rod. Were it not for the harbour the old bark affords insects there would be no necessity for removing it, and to hasten Nature in any of her operations is not a wise proceeding. In preference to stripping the rods bare, the best way is simply to remove any ragged portion of the bark that may be hanging or that will rub off by passing the hand round the stem; by so doing the buds forming around the spurs are left uninjured, which is an important point in the management of Vines. For instance, when the spur system of pruning is adopted it is necessary to prune back old spurs, therefore any dormant buds on the main stem should always be preserved. In the case of old spurs 6 to 9 inches long they are not only unsightly objects, but are always knotted and gnarled, and greatly impede the flow of sap, as may be seen by the weak way in which the eyes break.

Pruning is an operation that in most gardens is deferred much too long. When Vines are pruned late not only are they liable to bleed, which has a most weakening effect, but the buds at the base of the shoots are never so large and plump and so fully developed as those higher up the laterals, the tendency of sap being to flow to the extreme points; therefore the sooner it can be concentrated in those buds below intended for the following season, after the foliage is ripe and of no further service, the better and brighter are our prospects.

Because we see Vines without foliage and apparently dormant we must not conclude that there is no circulation of sap, as that to some extent goes on continually. By pruning early what little there is then in motion is confined to narrower limits, thus filling and plumping up all buds that are left. Vines on which Grapes are kept hanging are often greatly injured by late pruning, as not only are the Grapes taking a great quantity of sap to keep them plump, but there is likewise much expended on the numerous shoots and buds they contain. Happily the present system of placing Grapes in bottles sets Vines at liberty much sooner than they used to be.

A practice we adopt, and one which we strongly recommend in the case of late Grapes, is during the month of November to prune back all shoots from which the fruit has been removed and those that are not carrying fruit. We find that by adopting this system we have half the house pruned when bottling time arrives, while the increased amount of light and air admitted acts very favourably, the flavour of the fruit being greatly improved.

Vines pruned early start early with much less forcing than would be required otherwise. It is of great importance to help them on in this way instead of incurring loss of time and having to apply extra artificial heat to make up for the delay. When, from unavoidable circumstances, pruning has to be performed late, the ends of the cut parts should immediately be dressed with a styptic, otherwise it is next to impossible to stop bleeding when once it commences; so great is the force of sap and so continuous the flow, that the part is never dry long enough to allow anything to stick on it. At this season all insects that may be lurking in the cracks of the bark of Vines may be readily destroyed. We have found nothing so safe and effectual as a mixture made as follows:—4 ozs. of sulphur, with the same amount of tobacco juice and Fowler's insecticide added to a gallon of hot water, with sufficient stiff clay to give it the consistency of thick paint. This, carefully painted on the rods, will not only kill thrips and red spider, but their eggs, and the spores of mildew likewise. Previously to painting the rods with the mixture above named the house should receive a thorough cleansing, and the benefits derived from clean glass cannot be overrated.—J. LLOYD

WHITE FLOWERS.

ALLOW me to thank Mr. R. D. Taylor for his most valuable and interesting letters which have appeared from time to time in the Journal under the title "Twelve Hardy Herbaceous Plants of the Month." I have taken note of most of his selections, and wherever I find I have the plants he names my experience exactly coincides with his. If I may be so bold as to give a hint to so august a person as the Editor of the "Year Book," I would recommend him to print these lists under the various months. It is always a matter of difficulty referring to back numbers of the Journal, and unless these are bound they are often lost. The election of Roses which has from time to time appeared in the Journal has been reprinted in the "Year Book," and has proved most valuable.

I wish to say a few words upon a subject which I believe will prove interesting to at least one section of your readers. I allude to the clergy and those ladies who devote themselves to the task of decorating our churches at the various festivals, and also arranging the altar vases. The subject I allude to is that of white flowers. Now, I think it will be granted that good white flowers are rarer than those of any colour, particularly in the earlier half of the year, during which all the festivals of the Church occur. I do not of course allude to stove and greenhouse plants. I am aware that the flowers of Eucharis amazonics, Stephanotis floribunds, and Arums are white, also forced Lilies, a number of Camellias, Azaleas, Ericas, &c.; but many of us have no hothouses, or if we had could not afford togo to the expense necessary to grow such plants as these, still less are we able to buy Camellias at 1s. 6d. a blossom, Orchids at 2s. 6d.,

and other choice flowers in like proportion. I want to say a few words about a few useful garden plants which bear white flowers, taking them in the rotation of their blooming. But here I must confess my list is very small, and no doubt very many of your readers could add to it, but I shall give the name of no flower that I have not proved here and elsewhere.

of no flower that I have not proved here and elsewhere.

The first of all to bloom is Helleborus niger, the common Christmas Rose, which is the whitest of the genus. This is followed by the Snowdrop. After that we have the white forms of Daffodils, the best of which are Bicolor Empress, Horsfieldi, moschatus, and cernuus, which may be called sulphur white. The Hyacinths come next; but for altar vases they are too stiff, as indeed is Narcissus poeticus, which follows the Daffodils. We are now in March. When April comes we have the glorious Iris; Florentina and Albicans are the best of the Germanica barbata section. After these the English and Spanish Iris afford us splendid blooms of white flowers. At this time there are various herbaceous plants in bloom, one of the best is Galega officinalis. Now come the Tea and Noisette Roses, the earliest of which are Lamarque, Climbing Devoniensis, and Solfaterre. As soon as the Irises are over Liliums are in, and perhaps the best of all for decorative purposes is the common white Lily, Lilium candidum. Whilst these are still in full flower the Gladioli come in, and no flowers are more useful for vases than these fine spikes. Next we have the Amaryllises and Phloxes. The best of the white Phloxes is La Perle, which has very large petals pure white in colour. Lady Napier is also a very good white variety, and many others which I could name. Some of the Pentstemons, such as Atalanta, are also very valuable. Then there are the white Dahlias, and that lovely Anemone Honorine Jobert. Last to bloom are the white Chrysanthemums, which remain with us till the frost kills both leaf and flower, and long before they are over the mind is looking forward to and the eye examining the plants of Hellebores, which will soon commence the round once more.

These are only a few of the valuable plants which furnish us with white flowers, but I could extend the list very much. I have said nothing of the white Rocket (Hesperis) or Campanulas, or white Violets, or numbers of herbaceous plants. I have simply tried to give a list of white flowers which grow freely and bloom profusely throughout the year. Anyone who likes to add to the list will be welcomed by none more

warmly than by-WYLD SAVAGE.

EXHIBITING VEGETABLES-SCHEDULES.

In perusing that useful and instructive portion of the Journal of Horticulture, the correspondence column, in which such accurate information is given to your numerous inquirers, I noticed in the last number a reply to a correspondent who was evidently perplexed by the wording of a schedule. He is one of many who have been similarly puzzled, and it is a subject which should receive some attention from the committees and secretaries of horticultural societies, as the terms ordinarily employed in specifying what shall and what shall not be exhibited are not always sufficiently definite and precise. This use of ambiguous terms, or such as are not clearly understood, leads to much unpleasantness, and many exhibitors think themselves unfairly dealt with on finding that they have been disqualified through non-compliance with the conditions stated in the schedule, whereas had these conditions been clearly expressed no such difficulty would have arisen.

In the classes devoted to plants there is comparatively little difficulty, as the terms "variety" and "species" are usually sufficient for the purpose of restricting the exhibits; but these terms are inapplicable to vegetables where prises are offered for collections, and so another term "kind" is introduced, and a very unsatisfactory word it is, although like many other ambiguous words it appears at first glance to possess a definite meaning. "Kind" has really a generic and specific signification, and therefore when it is stated in a schedule that a certain number of "distinct kinds" are to be staged, it is optional for the exhibitor to send the products of plants that belong to different genera or different species, but varieties of the same species would be excluded. For instance, in strict accordance with the wording of the schedule Cabbages and Cauliflowers must not be included in one collection, because they are both varieties of Brassica oleracea. The term "distinct varieties" will not do, because any number of dishes of different varieties of Peas, Potatoes, &c., might be exhibited, and that is not what is desired.

It appears to me that all these difficulties may be removed by simply using the word "vegetable," which could not be easily misunderstood, and would answer all that is required. In a class for a collection of say "eight distinct vegetables," no one would think of showing two dishes of Potatoes or Peas, nor would Cabbages, Cauliflowers, &c., be excluded from the collection. The plan may be open to objection, but that it would prove extremely advantageous is the opinion of—A JUDGE.

GLAMORGANSHIRE HORTICULTURAL SOCIETY'S SHOW.

THE seventeenth annual Exhibition of this prosperous and well conducted Society was held in the park adjoining the Marquis of Bute's garden at Cardiff Castle on August 20th. By many competent judges the Show of this Society is considered one of the foremost in the provinces. In many respects the Society is particularly fortunate. The Hon. Sec., R. Payne, Req., with his persevering energy is well fitted to conduct the Society, and the gentlemen who annually act as Judges — Mr. W. Coleman, Eastnor; Mr. Parker, Tooting; Mr. Rogers, Battersea Park; and Mr. Austin, late gardener at Ashton Court, Bristol—are so well known that exhibitors always accept their awards with confidence. Notwithstanding the unfavourable season, the exhibits as a rule were quite equal in quality to those of former years. The products were arranged in eight large tents, the one containing the principal plants being the most attractive.

taining the principal plants being the most attractive.

Mr. James Cypher, Cheltenham, secured the first prize for the finest group of stove and greenhouse plants, Mr. E. Pilgrim, also of Cheltenham, being second; both exhibited plants well known to all frequenters of flower shows. In several other classes for fine-foliaged plants these two exhibitors divided the prizes between them; but in hardy Ferns Mr. E. Fowler, Pontypool, was a good first, and Mr. Pilgrim second; and in like manner Mr. C. Luard fairly surpassed the latter with eight exotic Ferns. Fuchsias were fairly well shown from the garden of Lieut.-Col. Hill, Llandaff; and by Mr. William Treseder, nurseryman, Cardiff, who had also some finely bloomed specimen Pelargoniums. The above were included in the nurserymen's section. Amongst the amateurs' plants Mr. Pilgrim was only third with six fine-foliaged plants; Lord Tredegar's gardener from Newport, Monmouthshire, being first, and Mr. C. Luard second. For the six exotic Ferns in this section Lord Tredegar's gardener was a good first; Mr. Andrew Pettigrew, gardener to Lord Bute, Cardiff, second; and Mr. G. Thomas a close third. Fuchsias, Coleuses, Pelargoniums, Petunias, Balsams, &c., were well shown by Mr. O. Luard, Llandaff; Mr. J. Watson. Mr. Taylor. Mr. Thompson. Preswyilfa, and others.

first, and Mr. C. Luard second. For the six exotic Ferns in this section Lord Tredegar's gardener was a good first; Mr. Andrew Pettigrew, gardener to Lord Bute, Cardiff, second; and Mr. G. Thomas a close third. Fuchsias, Coleuses, Pelargoniums, Petunias, Balsams, &c., were well shown by Mr. C. Luard, Llandaff; Mr. J. Watson, Mr. Taylor, Mr. Thompson, Preswyilfa, and others.

Amongst cut flowers Roses were, although almost out of season, shown in surprisingly fine condition by several exhibitors. For eighteen varieties Mesers. Cranston & Co., King's Acre Nurseries, Hereford, were first with large finely-formed blooms. Messrs. Davidson & Co., Hereford, were second; and Mr. Earle, Newport, third, both collections being little inferior to the first. For twelve Tea Roses, three blooms of each, Messrs. Davidson & Co. were first. For the special Rose prizes offered by Mr. Stephen Treseder, nurseryman, Cardiff, some very fine collections were exhibited, and the Judges had considerable difficulty in deciding whether to place Mr. A. Pettigrew or Mr. Crossling first for the eighteen dissimilar blooms, the ultimate decision being as their names now stand. For twelve varieties of Roses Lord Tredegar was first, Col. Hill, second, and Mr. Pettigrew third. For six Tea Roses Mr. Crossling was an easy first, Lord Tredegar rather a poor second, and Mrs. Pride, who, considering the extent of her exhibits and the size of her garden, must adopt an excellent system of successional cropping, third. Other cut flowers were well shown by Mr. Crossling, Lord Tredegar, Mr. Tout, and many others. The competition in table decorations was strong and formed quite a feature in the Show; Mrs. Heard, St. Andrew's Crescent, Cardiff, being first for a gracefully arranged table not too crowded with flowers, a feature which spoils the effect of so many dinner-table decorations.

decorations.

The fruit and vegetables in the gardeners' classes filled one spacious tent, and taken as a whole the contents were of a very creditable description. Pine Apples were more numerously shown than we have seen them at Cardiff for many years. For three varieties Mr. James Harris, gardener to Mrs. Vivian, Singleton, Swansea, was an easy first with a Smooth Cayenne, Queen, and Black Jamaica, all splendid fruit in fine condition. Several good fruits in the single Queen class were slightly over-ripe, consequently the prizes went to those of rather a small size but fresh. Lord Tredegar was first, and Mr. D. Morris second. In the class for any other variety Mr. C. Luard was first with a splendid Smooth Cayenne, and Mr. Pettigrew second with a small Globe. Muscat Grapes were wanting in high finish, still some very fair butches were shown, Mr. R. F. Gower, Bancastle, first; Mr. Vincent, Peniarth, second; and Mr. G. Jones, Maindee Park, Newport, third. For three bunches of any other white Grape Mr. Pettigrew was first with three large bunches of Foster's White Seedling

Mr. James Lewis second with the same variety, and Mr. Grossling third with Buckland Sweetwater, fine in berry and colour. For three bunches of Black Hamburgh Mr. R. F. Gower was first with good bunches, and Mr. J. Muir, gardener to C. R. M. Talbot, Req., M.P., Margam Park, second, with three bunches not more than three-quarters of a pound each, but faultiess in colour and bloom.

According to a note attached to them they had been ripened without fire heat. For three bunches any other sort of Black Grape Lord Tredegar was first with fine clusters of Madresfield Court, Mr. Lewis being a close second with the same variety. For a collection of Grapes the prize was given to the only lot shown by Mr. Pettigrew, none of his half dozen varieties or so being ripe. Melons were excellent, Mr. Crossling, Mr. Pettigrew, and Mr. F. Case, Cardiff, taking the principal prizes. Collections of fruit were poor, and so were most of the small dishes.

VEGITABLES.—For a collection of nine varieties seven good lots were staged, Mr. J. Muir being first with a collection in which Veitch's Autumn Giant Cauliflower, Sutton's Reading Onion, Carter's Challenger Pea, Turner's White Calesy, and several other dishes were of much merit. Mr. Crossling, St. Facen's Castle was a pleas garoned by Tornestoe being caregially. Fagan's Castle, was a close second, his Tomatoes being especially fine; Onions were not so fine as we have seen them, the first prize going to Mr. J. Muir for a dish of Webb's Banbury, spring sown, of fair size and good shape. Other single dishes of vegetables were well represented. Carter's new Telephone Pea from Mr. J. Muir secured the first prize amongst the hundred pods, and judging from its appearance as seen here we should say it is a Pea of much value, and one likely to be largely grown in future. Carter's new Leviathan Broad Bean from the same grower was also a meet attention first first prize first prize fair. also a most attractive first-prize dish, the pods being of enormous also a most attractive first-prize dish, the pods being of enormous size. Cucumbers were largely shown, many being notable for size more than quality. The first prize was awarded to Mr. J. Muir for a handsome brace of Telegraph. Petatoes were extremely fine and numerous, and the principal prizes were nearly equally divided between Mr. J. Muir and Mr. Crossling.

In many instances the cottagers' productions were little inferier to those of the practical gardeners. The Show is mostly supported by the principal gardeners in the counties of Glamorgan and Monmouth, and a few of the principal prizetakers may be summarized.

mouth, and a few of the principal prizetakers may be summarised as follows: — Mr. Crossling seven firsts, twelve seconds, one third; Lord Tredegar nine firsts, five seconds; Mr. J. Muir nine firsts, two seconds; Mr. A. Pettigrew five firsts, three seconds, one third; Mr. Hawkins, Rwenny Priory, three firsts, three seconds.—A. R.

SUMMER PRUNING FRUIT TREES.

"A NORTHERN GARDENER" rather begs the question when he accuses me on page 81 of crippling my young trees three years planted. I alluded on page 67 to trees on walls and espaliers, and if "A NORTHERN GARDENER" will come and see them he will find that, instead of being crippled, they already nearly fill the whole space I have allotted to them. encourage growth the first two years, but at the same time preme and train. All my trees are filled now with fruit buds for another year, and the fruit they are bearing only helps to discourage too much sappy wood growth. I quite agree, as "A NORTHERN GARDENER" knows, with the necessity for careful and constant summer pruning. I certainly have the advantage of light soil and pure sand foundation underneath. I leave the roots of my trees to themselves, and they always make planty of growth, but to secure fruit it is necessary to summer-prune. I cannot quite accept the statement about the necessity of wood being so much ripened by light and air. I do not cut away the interior of trees very much, but leave them close for protection of the blossom in early spring, and yet I get fruit quite into the centre of trees, even of those which have been in bearing for ten or twelve years and others for twenty years. Old orchard trees unpruned have to a great extent finished their growth, and the very fact of their bearing encourages the continuance of it. Still, overcrowded quarters of unpruned fruit and also large orchard trees not properly attended to are apt to have but a slender crop of fruit, and there I quite agree with "A NORTHERN GARDENER." All summer pruning should be done with a pair of scissors. I can prune two trees with scissors while your correspondent prunes one with a knife, and young shoots are often injured at the base by being pulled in cutting with a blunt knife; so that I think a knife and saw rarely requisite.—C. P. PEACH.

BONAPARTEA JUNCEA.—There is at present in the stove at Sea Park, Morayshire, a large specimen of this old-fashioned Peruvian plant in full flower. As I have only heard of it being twice flowered before in this county I thought it worthy of record. The plant is growing in a 15-inch pot. The soil used is loam with some brickflust. The stem of the plant is about 2 feet in circumference, from which spring the rush-like leaves, averaging 22 inches. The flower stem rises to a height of 103 feet; of that 7 feet are furnished with flowers of a greenish white about the size of a single Hyacinth. The stamens are twice the length of the flower. wards of five hundred flowers on the plant. -- WM. MACKIE.

TWELVE HARDY HERBACEOUS PLANTS OF THE MONTH-AUGUST.

ALTHOUGH there is a marked falling-off in freshness and colour during this month, yet with well-assorted collections there is no want of bloom to make the berbaceous borders still very attractive. Amongst these contributing most notably to this end may be given the following twelve:—

Acone news-contendies (the Bosy spined Acone).—This is a low-creeping evergreen plant, selden grown in herbaseous borders, but well known as really good for rockwork. It theore on long prostrate stems, which root as they grow, and which quickly carpet the ground with a mass of small brownish-coloured and delicately cut leaves. The little flowers -not unlike those of the Adoxa moschatellina—are of a de brown colour, and are hardly visible at the distance of a few yards, until in autumn the shoots are covered with long rosycrimson spines, when the highly ornamental character of the plant becomes apparent. It is very suitable for carpeting beds on which plants of a striking appearance are thinly planted, as it never rises more than 1 or 2 inches high. Easily prope-

gated by division during summer.

Funkia grandifora (suborrata), the Large-flowered Funkia.

One of the best of the genus, bearing large funnel-shaped flowers, milky white and most delicately seemted. The gistening leaves are heart-shaped and pointed, and in them the rather peculiar venation of the Funkias is very strikingly shown. The flower stems rise 12 to 20 inches, and the whole plant ferms a compact nound mass, which is very attractive when not in a crowded border. Though perfectly hardy it grows and blooms best in a warm situation and in light loamy

soil. A native of Japan.

Enothera macrocarpa (the Large-fruited Evening Primrese). This was figured and described in the Journal (page 371, vol. xxxv.). It is a decumbent species, with very large yellow flowers 3 to 4 inches across. An excellent plant for rockwork, never showing to greater advantage than when half drooping over a rocky ledge. Propagated by seed, which is easily obtained, though it does not ripen plentifully in this country.

Layers root freely during summer, though cattings do not. A native of North America.

Tradescantia virginica (the Virginian Spiderwort). - The Tradescantias constitute a genus of carious plants. They were so named in honour of John Tradescant, a Dutchman, who in the first half of the seventeenth century was gardener to Charles L He was father of the still more celebrated Tradescant who founded the Askmolean Museum. Whether or not this species was introduced by misher of these is uncertain, but it was long known as Tradescant's Spiderwort, and is one of the oldest and best known herbaceous plants we have. It has narrow Sedge-like leaves and branching flower stems, which bear umbels of deep violet-blue flowers with yellow anthers. It grows upwards of 2 feet in deep meist soil, and continues in flower nearly three months. There are a number of varieties white with blue anthers, lilac-rose, and pale red. Native of Virginia, where it is called Spiderwort from its supposed virtues as an antidote to the bite of poisonous spiders. Its

Propagated by division in spring.

Achillea Rtarmica ft. pl. (Double Sneezewort).—The single form is a native plant of no great beauty, but this is worth a place in any collection. It has numerous erect stems about 2 feet high, clothed with narrow serrated leaves and surmounted by dense corymbs of pure white very double flowers. These are valuable for cutting, though their somewhat strong odour

is sometimes objected to. Propagated by division.

Eryngium amethystinum (the Blue Eryngium).—The Eryngiums, represented in our native flora by two species, are zati peculiar plants, with stiff Thistle-like foliage and with their floral bracts, and in some cases the upper parts of their stams, more or less tinged with blue. This is one of the handsomest of the genus, and grows from 2 to 3 feet high. The root-lesves are finely cut and spiny, and those of the involucre are especially in dry warm seasons, of a bright amethystine blue,

as are also, though more faintly, the upper parts of the stems and stem leaves. Native of the Tyrol and elsewhere in Central

Europe. Increased by division and seed.

Statice Limonium var. latifolis (the Broad-leaved Sea Lavender).—This seems to be the best known as it is also the best worth growing of all the hardy Statices. It grows about 2) feet high, has smooth leathery leaves, and the flowers are disposed in large corymbs or panicles sometimes 2 feet across. They are light blue, and when dried like Everlastings they in ornamental for a considerable time. I find that the most expeditious way of propagating this plant is to cut a portion of it down a little below the surface of the ground early in spring, when numerous little rosette-like crowns of leaves will be produced in the course of the summer, which can be taken off and potted in autumn, wintered in a frame, and planted out in spring. The type, S. Limonium, is a native found, though not plentifully, on some of the muddy shores and salt markes of England.

Aconitum paniculatum (the Branching Monkshood).—The Aconitums are justly regarded with great enspicion on account of their poisonous qualities, but many of them are nevertheless very handsome border flowers. This species or variety is 4 or 5 feet high, with smallish finely cut leaves and branching panicles of flowers, blue variegated with white. It prefers a slightly shaded and dampish border, and may be readily in-

creased by parting its tuberous roots. A native of France.

Morina longifolia (the Long-leaved Merina).—This is a handsome Teaselwort with the leaves and spines of a Thistle. It grows 2 to 3 feet, and the flowers, which are white in the bud, become a beautiful rose colour when expanded. They are arranged in whoris round the stem, and give a long succession of bloom. It is thought by many to be a little tender, but I have never seen it killed by frost in light well-drained soils. A native of North India, and increased by seed or

Phygelius capensis (the Cape Phygelius).—A beautiful plant too seldom grown, though it is by no means rare. It grows 2½ to 3 feet high, and bears loose drooping racemes of bright vermilion searlet flowers with yellowish throats. Can be propagated by division or by cuttings like the Pentatemon, to

which it is allied.

Silene Schafta (the Autumn Catchily).—This bright little gem is suitable for either rockwork or the margine of beds or borders. It is a free-growing but compact plant, seldom rising more than 6 or 8 inches, and producing rosy-purple flowers in great numbers. Easily cultivated, but does best in light sandy soil. Can be propagated by division, cuttings, or seed, preferably the latter. Native of Siberia.

Verbaseum orientale (the Oriental Mullein).—A stately old-

fashioned border flower, growing 4 or 5 feet high and producing long panicles of yellow flowers with purplish throat. Grown in isolated groups or singly on a lawn it is very effective.

Propagated by division or seed .-- R. D. TAYLOR.

READING HORTICULTURAL SOCIETY.

THE autumn Show of the Society was held in the grounds of the Abbey Ruins on the 21st inst. The plants exhibited were clean and healthful. In the class for nine stove and greenhouse plants and healthful. In the class for nine stove and greenhouse plants (open) Mr. Mould, nurseryman, Pewsey, was first with a good collection of flowering and foliage plants; and Mr. Lees, gardener to Mrs. Marsland, White Knights, second. For nine variegated and foliage plants Mr. Ross, gardener to C. Byre, Esq., Welford Park, was first; Mr. Mortimer, gardener to Major Stone, second; and Mr. Bezant, gardener to H. J. Symonds, Esq., Caversham, third. For nine stove and greenhouse Ferns Mr. Bezant secured the chief position with medium-sized and healthy specimens. For single specimen plants the principal private in the classes were accounted by position with medium-sized and healthy specimens. For single specimen plants the principal prizes in the classes were secured by Mr. Mould, Mr. Ross, and Mr. Pound. In the classe for six plants for table decoration there was good competition. Mr. Ross, Welford; Mr. Atkins, Lockinge; and Mr. Brown, gardener to F. J. Barry, Esq., St. Leonard's Hill, securing the prizes in the order named. Fuchsias were shown well by Mr. Mould and Mr. Lees. The first prize, six Cockscombs, from Mr. Bridgeman, gardener to T. S. Cocks, Esq., Marlow, were very fine. Group of plants, 12 feet by 10 feet.—First Mr. Lees, second Mr. Burbidge, third Messrs. Phippin & Robinson, Reading. Bridal bouquet.—First Messrs. Phippin & Robinson. Twelve blooms of Roses.—First Mr. Mesyo, Oxford; second J. T. Strange, Esq. Messrs. W. Paul & Son showed excellent boxes of cut Roses, including such new varieties as May Queen, Countess of Rosebery, Duchess of Bedford, and Pride of Waltham.

Fruit was shown well considering the season, but not so ex-tensively as is generally the case at Reading. For eight dishes the prizes went respectively to Mr. Howe, Mr. Atkins; and Mr

Robinson, gardener to R. J. E. Colledge, Esq., Englefield Green For six dishes Mr. Tomlin, gardener to Miss Patterson, Bracknell was a good first; and Mr. Crump, Steventon Manor, second. For four dishes Mr. Bridgeman was first and Mr. Ross second. Three bunches of Grapes (Hamburgh).—Mr. Ashby, gardener to W. Fanning, Esq., Whitchurch, was first; Mr. Atkins second, and Mr. Tomlin third. Three bunches of black, not Hamburghs, the prizes went to Mr. Mortimer, Mr. Crump, and Mr. Bland, gardener to J. Graham Smith, Esq., Cranbourne Court. Three bunches of Muscats,
—First Mr. Ashby, second Mr. Feist, and third Mr. Ross. Three bunches of white Grapes, not Muscats.—First Mr. Atkins, second Mr. Wells of Fernhill. Mr. Bland secured the first prize for six Pacaches Mr. Atkins for six Nactorines and Mr. House and Mr. Peaches, Mr. Atkins for six Nectarines, and Mr. House and Mr. Burgess for Melons,

Vegetables were well shown by Mesers. House, Bellis, Jones, Tanner, and others. The awards of the Judges appeared to give general satisfaction, and the obliging Manager of the Show and Secretary (Mesers. Phippin and Petty) ably carried out all the

arrangements.

DUPLICATE ROSES.

I QUITE agree with "WYLD SAVAGE" that there are far too many duplicate Roses grown; but still I fancy he goes a little too far when he calls Sultan of Zanzibar and Reynolds Hole similar. They are far more distinct than many he does not name in his list of duplicates. Sultan of Zanzibar is a finer and much more constant Rose; in fact, although I grow them side by side, I have not had one single bloom of Reynolds Hole, but my Sultans have been really splendid. Besides, there is a greater difference in growth than "WYLD SAVAGE" detects, also the edges of the petals of Reynolds Hole are quite

round, whereas those of the Sultan are serrated.
"WYLD SAVAGE" thinks Mdlle. E. Verdier and Marie
Finger are identical. I do not. Eugénie Verdier is much brighter, also it is not so free neither so strong in growth, and does not come so surrounded with buds as Marie Finger, at least such is my experience of these unlucky Roses, which are constantly having fault found with then, because they are both beautiful, and one does not know on which to fix his choice. With regard to Mons. E. Y. Teas I think it quite dis-

tinct from Madame Victor Verdier.
I agree with "WYLD SAVAGE" that Marie Louise Pernet and Antoine Ducher are very much alike, but still there is a difference in favour of the new comer. I heartily concur in his quotation, "The sooner Maurice Bernardin, Exposition de Brie, and Ferdinand de Lesseps are called under one name the better.'

Alba Rosea, Madame Bravy, and Joséphine Malton are much alike, but of the three I think Joséphine is the strongest

I would not have taken up my pen were it not for "WYLD SAVAGE'S" remarks relative to Sultan of Zanzibar. I think such a rosarian as Mr. Paul (who sends out both Roses) would be likely to know whether those he was sending into commerce were dissimilar or not; and seeing what beautiful Roses he has from time to time presented us with, I think we ought to be careful in our remarks respecting them.—A. P.

MR. ROBERT BAKER of Heavitree has assured me that Sultan of Zanzibar and Reynolds Hole are quite distinct. He tells me that he had suspicions that Mr. Walters was in a fog about these Roses. Mr. George Paul has sent me blooms and descriptions, which prove that they are distinct. Mr. Baker considers that Duke of Wellington and Fisher Holmes are entirely different. I cannot see this; but he is such an authority that I give his opinion. I wrote, as I stated, from observations I had made at one nursery, the only one I am able to visit frequently. If I had the good fortune to be near Cheshunt or King's Acre I should be able to judge much better on such matters.—WYLD SAVAGE.

PETROLEUM LAMP STOVES.

I WISH to give publicity to the following facts, hoping thereby to draw forth, for my edification and the public generally, the experiences of others of your subscribers. My house is 22 feet long, 11 feet wide, and of a fair height. I wished to be able to keep up the temperature during the cold nights of the past six weeks from 60° to 65° Fahr. I tested the lamp stove three nights where the thermometer stood at 45° Fahr. without the lamp. At the end of twelve hours I could get no more heat during the night out of this lamp stove than 6° above the temperature of the place I put it in to test

it. It is made by one of the first makers of the day. I trimmed it myself and attended to it personally, and kept it under lock and key. The fourth night of its burning I lit it at 7 P.M. and only put up the wicks to half their proper height, meaning to increase their height at 10 P.M. I was suddenly called out from dinner by my man; the house was full of smoke, the wick in a blaze. Fortunately the wind was blowing strong at the time. Both doors and windows being thrown open and the lamp stove removed, the house was immediately cleared, and no harm has resulted, as would have been the case had it been burning benzoline or paraffin. On examination I found this stove lamp inferior in make and workmanship to the fine lamps by the same maker, of which I have burned seven for two years without accident, breakdown, or smell, using petro-leum of the best quality. I should like to hear if anyone has been able to get heat up to 60° or even 55° Fahr. from one of these stoves when the thermometer was at freezing point. should also like to elicit what is the best and cheapest small and effectual heating apparatus for such a house as mine, not wanted for forcing anything.—SAXORING.

SHROPSHIRE FLORAL AND HORTICULTURAL SOCIETY.

AUGUST 20TH AND 21ST.

THE above Society held its summer Show of fruits, flowers, and vegetables in the Quarry Grounds, Shrewsbury. These Grounds are very suitable for the Show, as they are within easy reach of the station, which is a great advantage to exhibitors. From the station to the grounds numerous flags were hanging across the street from the houses of the residents, thus showing the great interest displayed horticulturally by the inhabitants of this great interest displayed horticulturally by the inhabitants of this town. The great display that has just passed was the fifth summer Show of the Society since its inauguration on new and entirely different principles. Previously to that time we learn that the Society was financially in difficulties. It has, however, recovered wonderfully under the new and improved management, and this year the Exhibition was really grand, which must be highly gratifying to the Committee and Hon. Secretaries, and the Society is now in a good financial position. Before the present Show they had about £1000 in hand after having grantee the Corporation £100 for the improvement of the grounds where the Corporation £100 for the improvement of the grounds where the Show is held, and having paid £160 for a new band stand which was opened on the first day of the Exhibition. These pecuniary resources now place the Society in a position to stand against inauspicious weather, and to offer more prizes open to all England. On the opening day of the Show the weather was most unfavourable, rain falling in torrents; which circumstance, combined with a heavy fall of rain on the preceding evening, and the grounds having been utilised for the agricultural show only a short time before, rendered the turf in a very unpleasant condition for visitors, the mud in some places being ankle deep, while planks had to be laid down, otherwise it would have been almost im-possible to pass from tent to tent. This state of things did not daunt the visitors, as bidding defiance to the inclemency of the atmosphere they assembled in great numbers, and on the whole the Show had a good share of patronage.

The schedule contained 182 classes, four being open to all

The schedule contained 182 classes, four being open to all England, thirty-seven entirely devoted to cottagers in the country of Salop. The remaining classes were open to the counties of Montgomery and Shropshire. The Show was a great success as far as the exhibits are concerned. Tent No. 1, which contained all the open classes, was 150 feet long and 50 feet wide; tent No. 2 was 300 feet long, and was well filled with the plants from the counties named; the third tent, which was the same size as No. 1, was devoted to cut flowers, fruit, and vegetables; the fourth and last tent 200 feet long, was well filled with the cottagers' productions. We will first notice the Plants.—These were tastefully arranged in two large circular groups in the centre, and other groups round the side exhibited

groups in the centre, and other groups round the side exhibited by various nurserymen. The appearance of this tent was very by various nurserymen. The appearance of this tent was very imposing. In the class for twenty stove and greenhouse plants, not less than ten in bloom, Mr. Cypher of Cheltenham, and Mr. Tudgey, gardener to J. F. G. Williams, Esq., Henwick Grange, Worcester, secured the prizes in the order named; the former exhibitor, who overweighed Mr. Tudgey in flowering plants, staged Lapageria rosea, a remarkably fine specimen; Allamanda Hendersoni and A. nobilis, equally good; Ixora amabilis and I. Fraseri, very good; Dipladenia amabilis, clean, well grown, with an immense quantity of bloom; Bougainvilles glabra, 5 feet through; Erica Irbyana, Clerodendron Balfourianum; Croton majesticus, a fine plant, and well coloured; Gleichenias Mendelli, and G. speluncæ, very large; Croton undulatus, 6 feet through; and G. spelunce, very large; Croton undulatus, 6 feet through; Latania borbonica, Thrinax elegans, Pritchardia pacifica, Cycas Normanbyana, and a very large Phormium tenax variegatum. Mr. Tudgey's plants were Gleichenia hecistophylla, 8 feet through; Eucharis amazonica, very fine, with nearly forty spikes of flowers;

Erica Parmenteriana rosea, 6 feet through; Croton Johannis, rather short of colour; Allamanda Hendersoni, a good plant, one with very little bloom; Erica Fairreana, E. Williamsi, E. Irbyana, 5 feet, very good; Ixora coccinea superba, Dipladenia hybrida, Anthurium Scherzerianum, a very large plant, and in good condition; Latania borbonica, Stevensonia grandifolia, Cocos Weddelliana, Encephalartos Vroomii, and a very large Sarracenia

In the class for nine stove and greenhouse flowering or foliage plants Mr. Farrand, gardener to Mrs. Inson, Abbey Forgate, was first with Erica Aitoneana, Ixora amabilis, Dipladenia amabilis, Clerodendron Balfourianum, Erica ampullacea, Ixora coccinea superba, Croton pictus, 5 feet through and very well coloured; Pandanus Veitchii, and Latania borbonics. Mr. William Pratt, gardener to Viscountess Hill, Hawkstone, was second with well grown plants but short of flower. The collection only included one flowering plant, and that was a very good Ixora; the others were Pandanus Veitchii, Croton Queen Victoria, 4 feet through, were Pandanus Veitchii, Croton Queen victoria, a reet through, a fine plant, and well coloured; also a good plant of Croton fastigiatus, Alocasia metallica, Cissus discolor, Dracena Baptisti, and Alocasia macrorhiza variegata. Mr. Warrender, gardener to Colonel Meyrick, Apley Castle, was third with good plants of Erica tricolor Holfordi; Ficus Parcelli, 5 feet through, having fine variegated foliage of large size, and a well-developed plant; Croton Weismani, Abutilon Darwini tessellatum, 6 feet through; and Pagasia Chalcasi & feet In the amateurs' class for six and Begonia Chelsoni, 8 feet. In the amateurs' class for six stove and greenhouse plants Mrs. Lawrence Burd was first, the second prize being also won by the same lady. Mrs. Wallace was

In the open class for six Cape Heaths, distinct, Mr. Pilgrim, Cheltenham, was first with good plants about 4 feet through, of the following:—Erica Austiniana, E. Shannoni, E. Irbyana, E. insignis, E. Aitoniana, E. Turnbulli, and R. semula. Mr. Cypher followed with plants of Erica Aitoniana, E. Turnbulli, E. verticillata,

E. Eweriana superba, E. jasminiflora alba, and a very highly coloured E. Austiniana. Mr. Tudgey, whose plants were E. Fairreana, E. Marnockiana, E. semula, E. metulæsfora, E. tricolor major, and E. Macnabiana, was placed third.

In the class for six distinct Palms Mr. Tudgey was first. In this class it was a contest of quality against size. Mr. Tudgey's plants, not being half the size of the others, were choice, clean, and well grown. The collection included Kentia australia, Georgem argelis Pritchardia, pacifics. Areas Verschaffelt Georgem and well grown. The collection included Kentia australis, Geonoma gracilis, Pritchardia pacifica, Areca Verschaffelti, Geonoma princeps, and Cocos Weddelliana. Mr. Pilgrim was second with Pritchardia pacifica and P. filamentosa, Cocos Weddelliana, Livistonia altissima, and a plant of Areca lutescens. Mr. W. Pratt was third with Thrinax elegans, Geonoma Verschaffelti, Livistonia altissima, Seaforthia elegans, Latania borbonica, and Chamsrops Fortunei. Mr. Cypher obtained an extra third prize with Pritchardia filifera, Latania rubra, Areca lutescens, A. Verschaffelti splendida, Seaforthia elegans, and Latania borbonica. For six Dracsanas distinct, there were four entries. Mr. Warrender. For six Dracenas, distinct, there were four entries. Mr. Warrender, For six Dracemas, distinct, there were four entries. Mr. Warrender, Apley Castle, was placed first. The plants in this collection were well grown and of fine colour; indeed we never saw plants in better condition. Dracema Baptisti, very fine; D. ferrea, and D. amabilis, good; D. Chelsoni, D. magnifics, and D. regins, which was in better order than we have seen it for a long time. Mr. Pratt, Hawkstone, followed with remarkably good plants, although not so large as the first-price lot. D. Goldieana was in very good condition; D. Weismanni, D. terminalis alba, very fine; D. amabilis, D. Baptisti, and D. regins. Mr. Dwiche, cardener to R. C. Chol. D. Baptisti, and D. regina. Mr. Dytche, gardener to R. C. Cholmondeley, Esq., was third.

The competition in the class for twelve plants, distinct, suitable

for table decoration, was wonderfully close, and it was impossible for the Judges to decide between the lots shown by Mr. Pratt, Hawkstone, and Mr. Warrender, Apley Castle. They, therefore, decided to award equal first prizes to the exhibitors. Mr. Pratt staged cided to award equal first prizes to the exhibitors. Mr. Pratt staged in fine condition Dracesna gracilis, Aralia Veitchii, A. leptophylls, Croton Disraeli, C. Youngi, C. Weismanni, Kentia Belmoriana, Cocce Weddelliana, Geonoma gracilis, Dracesna amabilis, Pandanus Veitchii, and Aralia gracillima. Mr. Warrender's collection comprised Aralia gracillima, Pandanus Veitchii, Dracesna gracilis, Araucaria excelsa, Aralia elegantissima, Croton majesticus, Dracesna Guilfoylei, Cocce Weddelliana, and Reidia glaucescens. C. C. Coates, Esq., M.P., was second, and Mr. Farrant, gardener to Mr. Inson, third with smaller plants. For six distinct Caladiums Mr. J. Edwards, gardener to Sir C. F. Smythe, Bart., was first with good plants of C. Chantini, C. Hendersoni, C. Prince Albert Edward, C. Wrighti, C. pallida, and C. Belleymei. Mr. Farrant followed with C. Prince Albert Edward, C. Chantini, and C. Napoleon. The class for six Begonias in bloom was very poorly represented. Rev. J. H. E. Charter obtained the second prize, the only prize awarded by the Judges. In the amateurs' class for represented. Rev. J. H. E. Charter obtained the second prize, the only prize awarded by the Judges. In the amateurs' class for three plants E. Burd, Esq., was first, and B. W. Withers, Esq. second. For six distinct Coleuses Mr. John Jones was first with very fair plants of Duchess of Edinburgh, Kentish Fire, M. Thiers, Drummondi, Shah, and McMorran. R. Cholmondeley, Esq., was second with good pyramidal plants about 4 feet through and nearly 5 feet high. Mrs. B. Bird was third. In the class for six Fuchsias, Mr. T. Heath, Mr. J. R. Jones, and Lord Berwick were

placed in the order named. For three Fuchsias Mrs. Wace was first, and R. Burd, Esq., second. Liliums, Gloxinias, Petunias, Achimenes, and Balsams were very poorly shown.

FERMS.—The competition in the class for nine distinct exotic

Ferns was very keen between Mr. Pilgrim, Mr. Cypher, and Mr. Tudgey, who took the honours in the order named. The firstprize collection included Nephrolepis davallioides furcans, Glei-chenia rupestris, a fine plant; G. glaucesens, Davallia Mooreans, Cibotium regale, Marattia Cooperi, Gleichenia Mendelli, and Todea africana superba. The second comprised Alsophila australis, Adiantum trapeziforme, Cibotium Schiedei, Adiantum farleywans, Amantum trapeantorme, Chottum Schiedet, Adiantum farleyense, Davallia Mooreana, Gleichenia dicarpa, Cibotium regale, and
Neottopteris nidus. Mr. Tudgey's group contained dwarf-growing
species, such as Todea superba, Adiantum cuneatum, A. decorum,
A. scutum, a very good plant: and a plant nearly 8 feet through
of Adiantum gracillimum; Gleichenia rupestris, G. Mendelli,
Neotopteris australasica, and Gleichenia dichotoma. In the corresponding class for six Mr. Warrender was first with good plants of Alsophila australis, Adiantum formosum, and A. cardiochlæna. Mr. Pratt second with good plants of Adiantum cuneatum, Dicksonia squarroes, and A. formosum. Mr. Farrant was last, staging good plants of Adiantum farleyense, Lygodium seandens, and Cyathea medullaris. In the amateurs' class for four Ferns Mrs. Lawrence Burd was first, Mrs. Wace second, and John Price, Eq., third. Mrs. Sprott was first with six distinct hardy Ferns, Mrs. L. Burd, second, and Mr. W. H. Harrison third.

PELARGONIUMS.—In the class for six double varieties in flower fair numbers were shown, and some of the plants were in very good condition, while others were only moderate. Mesers. Oldroyd

fair numbers were shown, and some of the plants were in very good condition, while others were only moderate. Mesers. Oldroyd and Sons, Shrewsbury, received the first and second prises, and had good examples of Adelaide de Planchon, Jewel, Asa Gray, Triomphe, Marie Lemoine, Boule de Neige, Figaro, Emilie Lemoine, and M. Boutard. Mr. J. R. Jones was third with smaller plants but similar varieties. For six single Zonals in flower Mesers. Oldroyd & Sons were again first and second with New Life, Ellen, Pirate, Mulberry, John Fellows, White Vesuvius, Mr. Jacoby, and Lady Sheffield. Mr. J. B. Jones was third.

MISCELLANDOUS PLANTS.—Mesers. James Veitch & Sons, London, exhibited a general assortment of new and rare plants, which were tastefully arranged, and added materially to the effect of the Exhibition. Amongst the collection was a good plant of Yucca filamentosa variegats, Cypripedium Harrisoni-anum with several spikes, and a pan of very fine Bertolonfas, Dracma Goldicana, good pans of Sonerila Hendersoni, Pitcher Plants in great variety, Lapageria alba, Ixora salicifolia, well-bloomed small plants; Disa grandiflors with ten flower spikes, Cypripedium euryandrum, C. Parishi; Cattleya Loddigesi with between thrity and forty flowers open; Odontoglossum Roeslii, O. vexillarium. Rhododendrons of the newer type were also represented by this firm with such fine varieties as Duchess of Teck, Taylori, and Duchess of Edinburgh. They also staged a very fine Zygopetalum Sedeni, resembling Z. maxillare, but a very great improvement upon that species, with a great variety of Crotons, new Dracœnas, Alocasias, Ferns, &c. Mesers. F. & A. Dickson & Sons, Chester, also exhibited a fine collection of plants and Conifers in pots. Retinosporas, Yews, Cupressus, and Juniperus were represented in great variety; Ampelopsis variegats was also well shown in boxes. The collection of plants was good, perus were represented in great variety; Ampelopsis variegata was also well shown in boxes. The collection of plants was good, was also well shown in boxes. The collection of plants was good, consisting of well-grown young plants of the newer Dracesnas, Coleuses, and Crotons. They also staged Ferns, Palms, and many ether valuable plants. Messrs. James Dickson & Sons also staged a similar assortment of plants, which included a fine Croton Morti, and C. Johannis, Dracesna Baptisti, very large; and many other new Crotons, Ferns, Palms, Dracesnas, &c. Messrs. W. Pritchard and Sons, Frankwell Nursery, Shrewsbury, also exhibited an assortment of flowering plants, seedling Lobelias, Tuberous Begonias, Lilium auratum and L. lancifolium, Palms, Coleuses, &c. Mr. John Jones. Shrewsbury, and Messrs. Oldroyd & Sons staged Mr. John Jones, Shrewsbury, and Messrs. Oldroyd & Sons staged similar collections.

FRUIT on the whole was of fair quality, and was largely shown. Some classes were well represented, while others, especially the Grapes in several instances were short of colour. For a collection of fruit, eight sorts, Mr. Pratt, Hawkstone, was first with good dishes. This exhibitor had his fruit in better condition than any in disnes. This exhibitor had his truit in better condution than any in the Show, and he staged good examples of Moorpark Apricot, Brown Turkey Figs, Royal George Peaches, Colston Bassett Melon, Black Hamburgh Grapes very good in size of berry, Pitmaston Orange Nectarines, a Pine, and Warrington Gooseberries. Mr. Milner, gardener to Rev. J. B. Corbett, was second with black and white Grapes, Melons, Strawberries, Plums, Apricots, Nectarines, and a small Pine. For two bunches of Black Grapes Mr. Dantt was first with Black Hamburgh ware land. tarines, and a small Pine. For two bunches of Black Grapes Mr. Pratt was first with Black Hamburgh, very good; Viscount Boyne second with the same variety, only short of colour; Mr. McLean, gardener to Lady L. Cole, was third. For two bunches of white Grapes Mr. Pratt was first with Muscat of Alexandria in very good condition; Mr. Pearson, gardener to Lord Berwick, second with Buckland Sweetwater, and Mr. Milner third. For two bunches of black Grapes (amateurs) Mr. R. Thomas was first; Mr. W. J. P. Hopkins, gardener to Mr. Watton, second; and Mr. R. R. Clarke third. Mr. Warrender and Mr. Edwards, gardener to S. F. Smythe, Esq., received the prizes for Pine Apples. Mr. Warrender was first in the class for six Peaches with Royal George; Mr.

render was first in the class for six Peaches with Royal George; Mr. Edwards second with Lord Palmerston, very large; and Mr. E. Allen, gardener to Mrs. Stackhouse, third.

CUT FLOWERS.—These were largely shown in some classes, while others were not represented at all, such as the classes for Hollyhocks, Dahlias, and Gladioli. Roses were shown in fair quantity, the blooms being in poor condition and much dashed with the heavy rains. Two boxes were staged by Messrs. James Dickson & Sons (not for competition). The following blooms were good:—Prince of Wales, Louis Van Houtte, Général Jacqueminot, Charles Lefebvre, Victor Verdier, La France, Alfred Colomb, and Marie Baumann. In the class for forty-eight blooms Mr. W. Henderson, Ashford Court, was first; he had good blooms of Reynolds Hole, Lord Macaulay, Alfred Colomb, Gloire de Dijon, Annie Wood, and La France. Mr. William Davies, Ludlow, was second, staging good blooms of Dupuy-Jamain, Duke of Edinburgh, and Alfred Colomb. For twenty-four blooms Mr. William Davies was first, Mr. Chandler second, and Mr. E. Clarke third; and for twelve blooms Mr. Crump was first, Mr. C. Townsend third. Mr. Clarke, R. W. Pritchard second, and Mr. G. Townsend third. Mr. Clarke, Mr. J. Holmes, Mr. Harrison, and Mr. Jones were the principal prizetakers in the classes for Asters and herbaceous Phloxes. Mr. E. Davies, Mr. Pearson, Mr. Robinson, Mr. R. D. Newill, and Mr. Speake were successful exhibitors of Stocks, Carnations, and Picotees. The class for twelve varieties of stove and greenhouse blooms were well competed for by Mr. Pratt, Mr. John Jones, and Mr. Farrant, who took honours in the order named. Mr. Farrant, who took honours in the order named. The first-prize collection was a very fine assortment, having good trusses of Lxoras, Bougainvilleas, Stephanotis, Anthuriums, and Allamandas. Two boxes of Gloxinias (seedlings) were exhibited by Mr. E. Davies not for competition. Bouquets were numerous, Mr. J. Jones, Cotton Hill, taking the first prize; Messrs. Oldroyd and Sons the second, and Mr. J. Bain, Downton, third. For the bridal bouquet Mr. Jones was again first; Rev. J. H. Leigh Astley second, and Messrs. Oldroyd & Sons third. French and African Marigolds, Pansies, and Verbenas were staged in large quan-tities, but not in first-class condition. Standa of cut flowers for tities, but not in first-class condition. Stands of cut flowers for table decoration and also stands of wild flowers were shown in quantity, and added materially to the attractions of the tent in which they were placed. Many of them were elegant, light, and tastefully arranged. Mr. J. Jones received the first prize; Mr. H. Jones the second, and Mr. R. W. O. Williams the third.

VEGETABLES.—These were shown in large numbers. VECKTABLES.—These were shown in large numbers. In some classes as many as fifteen collections were staged. On the whole they were very good. For the collection of not less than ten varieties we counted sixteen exhibitors. Mr. E. Davies was first with good vegetables, this exhibitor showing nearly thirty different sorts; for instance, two varieties of Celery, two or more of Potatoes, Tomatoes, Onions, Turnips, &c. The other fifteen exhibitors adhered to the ten varieties. Mr. Pratt was second, and Mr. McLean third. For twelve kidney Potatoes Mr. Milner was first with International: Mr. A. Myers second, and Mr. E. Allen ar. mc.csan turd. For tweive kidney Potatoes Mr. Mimer was first with International; Mr. A. Myers second, and Mr. E. Allen third. For twelve kidney Potatoes (red) Rev. Hon. C. W. A. Fielding, Stapleton, was first, Mr. Chandler second, and Mr. Farrant third. For twelve round Potatoes (white) Sir C. F. Smythe, Bart., was first, Mr. Henderson second, and Mr. Brown third. The competition in these classes was so close that it must have been difficult work for the Judges. The remaining classes for Peas, Parsnips, Celery, French Beans, Onions, Turnips, &c., filled the whole side of a large tent, and the names of the prizetakers in the various classes have already been mentioned, Mr. Pratt with one or two

others taking the lead.

The tent that was devoted to cottagers was thoroughly well filled with plants, fruits, cut flowers, and vegetables. The quality of the plants of course was not very high, at the same time they were very creditable. Of the commoner fruits as many as forty dishes were staged, and the same number of Apples, Currants, &c. The vegetables were good, and their quantity was remarkable.
We congratulate the Honorary Secretaries, Mr. H. W. Adnitt and

Mr. W. W. Naunton, and the Committee for the very satisfactory way in which the Show was managed and conducted. Such a success could only be attained by united action and assiduous labour on the part of all who had the management of it.

STRAWBERRIES.

I AM not surprised that Mr. C. P. Peach is not able to agree with me as to the merits of certain varieties of Strawberries, and the difference between us would be still greater but the soil and climate are not very different. We both have a light soil, and if I understand rightly, both soils are derived from the oolitic rocks. He cannot grow La Constante, and finds it of inferior flavour. With me it succeeds very well, and the quality is of the first class. I have on many occasions gathered several varieties when in good condition, and asked visitors their opinion as to their merits with reference to flavour, and they all pronounced La Constante to be equal if not superior to any. Mr. Peach says he can grow as large a weight with

Lucas and some others as with Keens' Seedling. I am glad to hear it and hope I may do the same, but I do not expect it. Some seasons I grow perhaps as great a weight with Sir J. Paxton and other large varieties, but in other seasons there is a great falling off. The great mistake made by beginners in gardening is that they look over lists of Strawberries and other fruits, and select all the most highly praised without considering the soil and situation at all, and the result very often ends in disappointment. They should choose rather those which succeed well in the district where they live. I am much obliged to Mr. Peach for his hint about the preserve. He speaks of Dr. Roden's seedlings. There were some which were to prove later than any in cultivation; are they coming to the front or receding to the far distance?—AMATEUR, Circucster.

ROYAL HORTICULTURAL SOCIETY.

AUGUST 26TH.

This meeting was not characterised by any extraordinary display, although the exhibits were sufficiently numerous and good to impart some interest to it. The chief features were Mr. Cannell's collection of flowers, and the Gladioli from Messrs. Kelway & Son of Langport, which are mentioned below. Messrs. Perkins' Roses were also noticeable for their freshness and substance; and Messrs. Turner, Bull, and Smith all contributed collections of more or less merit.

lections of more or less merit.

lections of more or less merit.

FRUIT COMMITTER.—Henry Webb, Esq., in the chair. There was a poor display of fruit, a few Melons and Apples only were staged. Messrs. Carter offered prizes fer a single fruit of Dell's Hybrid Melon, for which five competitors appeared. Mr. T. Taylor, gardener to J. McIntosh, Esq., Duneevan, Catlands Park, obtained the first prize with a fruit of moderate size and well ripened. Mr. the first prize with a fruit of moderate size and well ripened. Mr. Thomas Jones, The Gardens, Elvetham Park, Winchfield, was second; and Mr. J. Burnett, The Gardens, Deopdene, Dorking, was third with smaller fruits. Mr. Gray, gardener to C. Seely, Rsq., Brooke, Isle of Wight, sent two fruits of Gray's Seedling Apple finely coloured. Mr. J. Douglas, The Gardens, Loxford Hall, Ilford, sent dishes of excellent Kerry Pippin and Strawberry Pippin Apples. Mesers, Hurst & Sons, Leadenhall Street, exhibited a dish of New Manmoth News Reams for which a first class care. a dish of New Mammoth Negro Beans, for which a first-class cera dish of New Mammoth Negro Beans, for which a hist-class certificate was awarded. The variety is very prolific and the pods are of great size. Messrs. E. A. Webb & Sons, Stourbridge, sent dishes of a new Marrow Pea, and Messrs. James Cock & Son, Weybridge, exhibited a seedling Pea named Cock's Conqueror. Mr. Wm. Culverwell, The Gardens, Thorpe Perrow, Bedale, exhibited Peas and haulm of a new seedling Pea named Autumn Marrow, of great size and very prolific.

Marrow, of great size and very prolific.

FLORAL COMMITTEE.—Dr. Denny in the chair. Mr. H. Cannell, FIORAL COMMITTEE.—Dr. Denny in the chair. Mr. H. Cannell, Swanley, Kent, exhibited extensive collections of Verbenas, Phloxes, Pseonies, and French Marigolds. Among the Verbenas were several excellent varieties both in colour, size of flowers, and truss. Lady Langlesbury was remarkably distinct—each lobe of the corolla has a broad stripe of pale lilac down the centre, and a white margin; Marquis of Salisbury, a fine crimson purple; Shakespeare, rich scarlet with a small yellow eye; Esmeralda, large, white streaked and spotted with purple; Kentish Beauty, dark purplish blue, neat truss; Boule de Neige, an excellent white; Lady Leigh, pale purple, close truss; Lord Leigh, good scarlet with minute eye. The Marigolds were finely formed and brightly coloured. The Phloxes were distinguished by their large flowers and trusses, The Queen being a fine white. A gold medal was awarded for the collection. Messrs. Kelway & Son, The Nurseries, Langport, sent a very large collection of Gladioli, comprising forty-eight spikes, some of which were of extraordinary size. The most noteworthy varieties were Admiral Willis, a handsome scarlet salmon, large flowers and spikes; *Electra, a handsome scarlet salmon, large flowers and spikes; "Electra, a rosy pink faintly streaked with white, good spike; Earl Dalhousie, slightly streaked with pink; "T. S. Ware, rich scarlet, with a faint pinkish tinge at the base of the lower petal, spike of enormous size. One of Mary white the lower petal, spike of enormous same pinkish tinge at the case of the lower petals streaked with rosy lake; A. F. Barron, light salmon ground streaked with dark shade, lower petals streaked with purple, large spike; "Samuel Jennings, scarlet, narrow white streak down the centre of each Jennings, scarlet, narrow white streak down the centre of each petal, lower one white except the tip; Jessica, a delicate pink, base of lower petal whitish yellow, very pretty; *Duke of Connaught, crimson streaked, good spike, well-formed flower; *Duchess of Connaught, white, with the lewer petals streaked with lake. A vote of thanks and a gold medal were awarded for this handsome group. First-class certificates were awarded for the varieties marked with an asterisk.

Mr. William Bull, King's Road, Chelses, exhibited a number of new plants, and first-class certificates were awarded to the follownew plants, and net-class certificates were awarded to the following:—Carludovica Drudei, a light green fan-leaved Palus with long petioles; Kentia Wendlandi, pinnate leaves, with a broad bifid terminal portion; Encephalartos Frederici Gulielmi, with short stiff pinnate leaves of a glaucous hue; Agapenthus umbellatus albus, umbels large, flowers small but numerous, pure white with yellow anthers, leaves dark green and narrow. Several other

plants were sent, and among them was a pan containing about twenty superb flowers of Tigridia grandiflora. The Committee twenty supero nowers of lighting graintines. The Committee recognised their merit by according Mr. Bull a vote of thanks. From the Society's garden at Chiawick was sent a large collection of crimson and yellow Celosias and Cockseombs; also plants of Abutilon Sellowianum marmoratum with extremely large leaves, some being 10 inches long and the same in width. Six plants of the peculiar Reidia glauoescens were also exhibited, and seedling Begonias. Mr. Charles Turner, The Royal Nurseries, Slough, exhibited four boxes of remarkably handsome-Picotees, the strain of which was highly commended. First-chase certificates were awarded to the following varieties:—Princees Beatrice, pale yellow, light crimson edge, slightly streaked, good flower; Sultana, a light scarlet self, large and good; and Lady Rosebery, a delicate pale yellow self, well formed. All the flowers were very fresh and bright and of good substance. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, exhibited flower spikes of the new Montbretta Pottsii from South Africa—long spikes of small orange-scarlet flowers. Messrs. Perkins & Sens, Coventry, contributed four boxes of cut. Roses, the majority of which were in good condition, notably Louis Van Houtte, Alfred Colomb, and Mons. E. Y. Teas. The boxes contained on an average twenty-four blooms each. A silver recognised their merit by according Mr. Bull a vote of thanks. boxes contained on an average twenty-four blooms each. A silver Banksian medal was awarded for this collection. Messus. F. and Banksian medal was awarded for this collection. Messrs. F. and A. Smith, West Dulwich, were accorded a vete of thanks for a large plant of Asparagus pluments and a collection of Balsams moderately well flowered. Messrs. James Carter & Co., High Holborn, contributed some new Coleuses, among which Canary Bird was neticeable for the preponderance of yellow in the foliage. The Committee desired to see larger plants of the varieties. Mr. Lleyd, gardener, Brockwood Asylum, Woking, also sent some new Coleuses, the variety named Allen Chandler being the best, having very dark crimson foliage and compact habit. A vote of thanks was accorded the latter exhibitor.

PEAR ELECTION.

I FEAR I am about to write what will cause some disappointnent, and I feel it myself. I have been putting off writing day after day.—I have had my elbow jogged metaphorically by somebody at 171, Fleet Street, jogged by a letter, "We shall be glad of your notes on the Pear Election;" but if you, Messre. Editors, will be "glad" of my notes, I am sorry to have to write them, and Pear-growers, especially amateus, will be sorry to read what I write. How san I to begin? What is difference there is about writing lebters? Say there is a bundle. a difference there is about writing letters! Say there is a bundle of them to be answered, and there is a disagreeable one in the bundle, you answer all the others first, at least I do. Tis so pleasant that one's fingers itch to begin. "I am so much obliged to you, my good friend, for your kind invitations," &c. But the letters are all answered except that nasty one, and there it lies staring at you—squinting at you with its disagreeable eye, so to speak. But about this Pear election. How am I to begin? Well, perhaps it is best to blurt out the distasteful truth at once, like pulling at once the string of a shower bath, for it must be doze. There is not to be a Pear election. "And why not?" will ask in turn a great many voices? Well because those in authority forbid it in a Pear election. "And why not?" will ask in turn a great many voices? Well, because those in authority forbid it in the wide interest as they deem it of pomologists and of the fruit-growers generally. The Apple election was a dis-sppointment; the varieties that came to the front were those not necessarily the best, but because they were the most widely grown. As an instance of this, Blenheim Pippin heads the list of dessert Apples when most certainly it is not the best dessert Apple grown in England, but its position is explained by Mr. Kellick, ride Apple Election, Journal of Herticulture, Nov. 8th, 1877, that "it is at the head of the list, not on its merits as a dessert Apple, but on the votes awarded in both kinds, dessert and kitchen, and if left in the two lists it would not have had due justice rendered to it." This is a fair explanation, though it would have been better to my thinking for it to have appeared in both lists, for most certainly Blenheim Pippin is far from the best of either kitchen or dessert Apples. I individually answer the objection raised. But in regard to Pears no contest can take place between dessert and kitchen, for the Pear is specially a dessert fruit, and only a very brief list of stewing Pears would be added. The objection as to the varieties most known coming to the front may be answered, that in time the best will be most widely grown. The point is, how to make the public know which are the best. My own idea was and is by an election judiciously made by amateur, and I think amateurs only. If the knowledge of the best classes of fruit is to be increased all mere trade considerations must be thrown to the winds. I am swere for similar reasons that the Rose election is objected to, and that the new series

have a hard struggle to get themselves sold. My answer is, that if really first-rate they will make head in time. When I speak of amateurs as electors I certainly would be understood to include gardeners, particularly head gardeners in large gardens; their opinions would be most valuable. What I want to mend is the state of affairs in thousands of gardens where stand Fear trees, very handsome as trees I grant, but bearing inferior fruit; and yet there the trees stand, and their owners when inclined to root them up do not knew what are the best trees to put in their places. An election, I think, would help such people to a right knowledge.

But the election as an election according to my ideas is not to be. What may be done in the columns of the Journal is, that cultivators can send the names of Pears which thrive best with them, stating locality; soil, stocks, and any other particulars that are necessary should also be named. That these returns will be published but no tabulation made, then readers one draw their ewn conclusions. This I hope will be done, and some good, no doubt, will be the result, though individually I am disappointed that no more extended plan is to be carried

out.-WILTSHIRE RECTOR.

[In an election of Pears such as our correspondent desires some of the very finest varieties would inevitably fall low on the list, for the obvious reason that they are not grown by all who would send in returns, and hence Pears of intrinsic merit would be placed in a false position, while varieties that are more largely grown would have a value attached to them that they do not legitimately possess. Lists of Pears as grown in different localities with the cultivators' notes on the varieties, and other relative information of a useful tendency, will be readily published as suggested in the last paragraph of "WILTSHIEE RECTOR'S" letter.—Eds.]

NOTES AND GLEANINGS.

ALTHOUGH Saturday last was in some districts one of the finest days of the summer, in London and vicinity it was one of the wettest. From early morning until past mid-day the name fell in torrents, causing much damage to dwellers in low-lying localities, and many gardens, as well as the London parks, were almost rendered flowerless by the drenching they sustained. The subtropical department of Battersea Park was converted into a miniature lake, the lower part of the lawn being submerged for some hours. The only portion of the decorations that was not materially injured by the downpour was the carpet bedding where Lobelias were not employed in the designs.

- In the Temperate house at Kew we recently noticed that the shrubby VERONICAS were flowering most profusely, and their value as decorative plants in a winter garden, such as the one at Kew, cannot be estimated too highly. Veronical imperialis is a remarkably handsome plant, similar in habit and foliage to V. Andersoni, but the numerous long pyramidal spikes are densely crowded with rich rosy-crimson flowers. V. Andersoni forms an admirable contrast to the last, bearing equally fine spikes of deep purplish-blue flowers. The variegated form of this species is also extremely ornamental; the foliage is finely streaked with creamy white, and the flowers are of lighter blue colour. Planted out in a good border of sandy loam the plants speedily attain a large size; and although the flowers are somewhat fugacious, the large number produced compensate for this defect.
- —— "AMATEUR, Cirencester," asks if any of our readers can give him the receipt for rendering LABELS indelible. He believes they are dipped in lime water, and afterwards in a solution of sulphuric acid and water.
- —— MR. HUDSON, Sir W. Armstrong's gardener, informs us that there is a very fine plant of DESFONTAINEA SPINOSA at Cragside, near Rotabury, Northumberland, grown in a border that is protected during winter with glass. The plant is now in full flower. In the same border there is a plant of BERNERIDOPRIS CORALLINA, which does remarkably well. These two plants, Mr. Hudson states, are greatly admired.
- On the occasion of the unveiling of the statue in honour of the late MR. VAN HOUTTE at Gendbrugge, near Ghent, on the 17th inst., a large number of botanists and horticulturists assembled, forming a cortege upwards of a mile in length. The monument, which is placed close to Mr. Van Houtte's famous nurseries, represents Flora crowning the great horticulturist with a Laurel wreath. Suitable addresses were delivered by the Governor of Hainault, the Mayor of Ghent, and others,

and in the evening a banquet was held in honour of the occasion.

- THERE is a very fine display of LILIUM AURATUM IN MESSES. VETTCH'S NURSERY at Chelsea, a large house being entirely filled with plants flowering in 5 and 6-inch pots. Small as the pots are, several of the plants are supporting a dozen grand flowers, and some of the varieties are very beautiful. Not many Orchids are flowering now. A few of the most striking are Oncidium concolor, Saccolabium Blumei, and Dendrobium Parishi, very rich; D. formosum, fine; with a few Odontoglossums, Cattleyas, and Cypripediums. Amongst the plants not flowering a splendid and healthy importation of Phalsenopsis attracts notice, as also do the Dendrobiums on secount of their robust growths, the plants being grown in small saucers suspended from the roofs of the houses. Not less attractive to many visitors are the Vines in pots, upwards of two thousand of which are grown in the nursery, remarkable for their hard and nearly pithless wood and bold eyes—the sure precursors, with good management, of satisfactory crops. Several plants of Gaura Lindheimeri are flowering; the flowers blush white, and borne in spikes 2 feet high, resemble in form large Lobelias. This plant is largely grown in Parisian gardens.
- A CORRESPONDENT who has recently visited the nurseries of MESSES. MACK & SON of Catterick and Scorton, Yorkshire, successors to the late Mr. J. Harrison, states that the Napoleon stock for Roses is largely employed. The stock was received from France, and was first used by the late Mr. Harrison upwards of twenty-five years ago. It is found to produce an unusual number of fibrous roots, hence its adaptability for Tes Roses; indeed all kinds of Roses succeed well on it, and it is readily struck from cuttings. Amongst the newer Roses Mr. Mack speaks highly of Boieldieu, Egeria, Lord Beaconsfield, Clement Nabonnand, Louis Richard, Madame Lambard, Madame Welch, and Mabel Morrison. Budding was just at its height, and some acres were done. The buds are inserted well below the soil, a portion being taken away for the better performance of the work.
- evening for the purpose of taking steps to raise a substantial relief fund for the nurserymen and florists in Richmond, Twickenham, Teddington, Brentford, Isleworth, Ealing, Kew, and neighbourhoods, who have been sufferers by the DISASTROUS HAILSTORM OF AUGUST 3RD, and who have little or no means left to repair their grievous losses. Mr. J. Fraser presided, and gave an outline of the operations of a committee of a similar fund which was raised after a hailstorm which swept over the north of London a few years ago. A resolution declaring the necessity for the fund having been adapted a Relief Committee was appointed, with Mr. Pennysather, manager of the London and County Bank, Richmond, as Treasurer, and Mr. Richard Dean of Ealing as Hon. Secretary. About £350 had been premised before the meeting, and weveral additional amounts were handed in.
- That interesting and handsome native tree PYRUS AUCUPARIA, the Mountain Ash or Rowan Tree, is searcely to be rivalled as an creamental tree when bearing its numerous clusters of small bright crange-coloured fruits. There is an instance of this in Windsor Castle, where a fine specimen rises from the Castle slopes high above the Terrace walls. The tree is loaded with "berries," the brilliant colour of which combined with the graceful pinnate foliage renders it an object of admiration to all visitors.
- and others of that genus of the Conferous tribe has been exciting a considerable degree of attention in various parts of the country for some time past, having in some districts exhibited strong symptoms of premature decay, and in certain cases they appear to be actually dying out, although said to be perfectly healthy and vigorous up to within about two years ago, when the "disease" that is killing them first made its appearance. The first sign of the disease being present is indicated by the trees assuming a yellowish sickly aspect, which quickly gives place to a rusty brown or scorched-like appearance, followed ultimately by the dropping of the leaves, the death of the tree ensuing in accordance with the laws of Nature in evergreens so denuded of their foliage. The subject is of the greatest importance to the arboriculturist, as the spread of the disease would entail heavy loss on the owners of Spruce plantations, as it appears to attack indiscriminately all the species of the Spruce Fir family grown in this country. At

the recent meeting of the Scottish Arboricultural Society the subject was brought under the notice of the members present in an able paper, read by Mr. C. S. France of Peniouik, upon which a considerable amount of discussion ensued, and the fact was stated that the disease had been long known to exist in situations inimical to the healthy growth of Spruce. It was also stated that the disease has within recent years attacked Ables Mensiesit, A. Smithians or Morinda, and A. orientalis, and that no species of Spruce Fir cultivated in this country is exempt from its attacks .- (Journal of Forestry.)

A NEW TREE PRUNER.

WE have received from the Standard Manufacturing Commy, Derby, an implement which surpasses all others of its and with which we are acquainted, and which cannot fail to be of great value in pruning trees of all kinds that cannot

Fig. 20. Tree Pruner

readily be reached with a ladder. For shortening small branches that overhang carriage drives this implement will be invalnable. It combines lightness with strength, and dres its work in the most satisfactory manner. Unlike the old averruncator, which is worked with a string, this pruner is worked with a metal rod and lever, and the branches are cut precisely in the same manner as when severed with an ordinary pruning knife—that is, there is no bruising, but a clean steady smooth cut. We have severed with ease wood an inch in diameter without any abrasion or splintering whatever. In using the pruner all that is necessary is, with the left hand to hang the hook of the implement on the twig or branchlet to be severed, as shown in the annexed figure, and to draw down the lever with the right hand, and the work is done with case and satisfaction. The pruners are made of different lengths, and will sever all branches up to an inch in diameter. The small blade is movemble, and can be taken out and sharpened as required, and if at any time it becomes injured it can be replaced with a new one at a trifling cost. The new pruner will probably become a favourite with gentlemen, foresters, and gardeners who require something of the kind for trimming

COTTAGE GARDEN SHOW AT KINGSTON VALE.

COTTAGE GARDEN SHOW AT KINGSTON VALE.

August 21st.

Principally through the exertions of Mr. Darinall (Messra, Veitch's manager of the Coombe Wood Nursery) a very fine display of oottagers' productions were collected together on the 21st inst. Kingston Vale is quite a rural village, belonging to H.R.H. the Duke of Cambridge, and situated within a very short distance from White Lodge, the seat of the Duke and Duchess of Teck, who took a very deep interest in all the morning they came and distributed the prizes during the afternoon.

There was a most artistically arranged bank of plants on the whole of one side of the building, the groundwork being principally Selaginella denticulata, with an outer edging of Isolepse gracilla, and distributed over its surface were small Palma, Caladium argyrites, Orchda, and other flowers. The plants in this group were mainly contributed and arranged by Mr. Darinall, Mr. Baker, and Mr. Denning, and were greatly admired. On the opposite side were arranged the cottagers' productions, which taken collectively were very good indeed. In the class for three window plants there were no less than nineteen competitors. This was no easy class to judge. At the ends of the building were displayed collections of fruit, which were extensively shown, especially Grapes, of excellent quality and well finished—in fact, we heard a good authority (Mr. H. Veitch) say the Show contained the finest-coloured Black Hamburghs he had seen this season. Mr. Baker, gardener to R. C. Baring, Esq., sent two very fine bunches of Muscat of Alexandria and two of Black Hamburghs a good Melon, Late Admirable Peaches, and Tomatoes. Mr. Olterhead, gardener to the Ev. J. Forter, Roehampton Park, and Mr. Lowman of Kingston Hill. Mr. Daviss, in addition to three or four stands of Grapes, exhibited a large basket containing several pounds of well-finished Hamburghs.

In a large marquee were several tastefully arranged groups contributed by Mr. Lees, gardener to the Eev. W. Finch; Mr. Kent, gardener to G. W. Curtis, Esq.;

all of which there was excellent competition. Many other exhibitors' productions were unusually good. The schedule was very complete and varied, and great praise is due to Mr. Dartnall and Mr. Sawyer, the Hon. Secretary, for bringing everything to such a successful issue.

CHOICE GARDEN ORCHIDS,-No. 7. CATTLEYA,

(Continued from page 92.)

C. Massie. Hook. (Bot. Mag., t. 8669).—The figure here quoted is the original form, and therefore must be accepted as the normal state of the plant. Since its first flowering, however, such an immense number of grand varieties have been introduced and have become such general favourites that the name of Mrs. Mose of Liverpool, in whose honour it was named by Sir William Hooker, will not soon pass from the memory of Orchid growers. Pseudobulbs clayate, slender at the base, much forward supporting a plant consciling ablorage biase. much furrowed, supporting a single, spreading, oblong-obtast leaf, which is deep green above, paler below. Whole plant 12 to 18 inches high. Scape erect, many-flowered; blooms 5 to 6 inches in diameter, and delicately fragrant. Sepals lanceolate, acuminate; petals much larger than the sepais, oblong-ovate. When first expanded the sepals and petals are nearly white changing with any to not the delicate was: In threenearly white, changing with age to soft delicate rose; hp threelobed, obovate-creaulate on the margin; middle lobe large and | streaked with brown. It blooms during spring and summer-spreading, colour rich carmine streaked with yellow and | La Guayra. 1836.

Fig. 21.—CATTLETA MOSSIÆ.

The following handsome varieties are equally as deserving of cultivation as the typical species: C. M. var. Ainsworthit.— Againd variety, petals and sepals creamy white; lip rich rosy supple with clear lemon-coloured throat. C. M. var. aurea.— Lip orange-buff at the base mottled with violet-rose. C. M. var. complanata.—Petals not frilled; lip veined and mottled with purple and petals blush colour; lip strongly marked with buff cauge at the base. C. M. var. aurea grandiflors.—Flowers larger than the last, sepals and petals aimilar; lip stained with

but the flowers are smaller. C. M. var. fimbriata.—Flowers extremely large, with much-crisped sepals, petals, and lip. C. M. var. flammea.—Flowers small but finely coloured; lip deep rich orange colour marked with rosy violet. C. M. var. grandiflora.—Lip deep purple rose slightly stained with orange. C. M. var. grandis.—The labellum in this variety is the largest of the series; it is prettily mottled with violet rose. C. M. var. Helense.—Similar to the last but more brightly coloured. C. M. var. Lawrencianse.—A handsome form; lip stained with orange and slightly veined with violet rose. C. M. var. Marianæ.—A distinct small-flowered form. Sepals and petals white; lip mottled with rosy wiclet and edged with white. C. M. var. marmorata.—A form with very light flowers; lip finely fringed. C. M. var. Mooreana.—A beautiful form, easily distinguished by the clear narrow white border of the lip. C. M. var. Napoleonis.—Flowers very erect, with a charming rosy tinge. C. M. var. purpurata.—Flowers large; hip deep violet-rose marked with orange. C. M. Rothschildiana.—Lip orange-coloured at the base, lined with rosy purple. C. M. var. splendens.—Resembling the last, but the labellum is more brilliant. C. M. var. striata.—Lip striped with dark purplerose. C. M. var. superba.—A handsome form. Sepals and petals dark blush; lip large, stained with orange. C. M. var. venosa.—Lip stained with orange and beautifully fringed. C. M. Victoriss.—The orange markings on the lip very distinct. C. M. var. Wagneri.—Sepals and petals pure white; lip also white with an orange stain in the centre. C. M. var. Williamsii. -A beautiful variety with pale blush flowers; the lip marked with orange. All these varieties are eminently worthy of cultivation.

NATIONAL CARNATION AND PICOTEE SOCIETY. NORTHERN SECTION.

This Society held its Exhibition on Saturday, the 24th inst., in the large conservatory at the Botanic Gardens, Old Trafford, Manchester. The day was one of the finest of the year, but the Show, as was expected, was far from being a good one; many growers were unable to bring any flowers, whilst those that were brought were generally of interior quality, as they had nearly all been herealth of the property of t

been brought on under glass.

Amongst the best of the older varieties Admiral Curson was very fine, whilst Mars was noticeable for its dirty white. In crimeen tine, whilst Mars was noticeable for its cirry write. In crimeon bizarres J. D. Hextall was in the first rank, and very fine. In pink and purple bizarres Sarah Payne, with its pure white, and James Taylor, were the best. In purple flakes Dr. Foster was the best, closely followed by James Douglas. In scalet flakes Sportsman and Clipper were fine, and in rose flakes Sybil and John Keet were very good; this latter variety winning

premier.

Amongst Picotees, in heavy reds the best were Mrs. Fuller, very fine; Lord Valentia, fine; William Summers, Morna, and J. B. Bryant. In light reds Thomas William and Violet Donglas were far the best. In heavy purples Zerlina was the best; another called Isabella was very fine. In light purples Azm Lord and Mary were fine; whilst in heavy roses Miss Horner was very good, winning premier with a fine young bloom; other good ones were Rosy Queen and Edith Dombrain. In light roses Miss Wood was the best; Teresa and Mrs. Allcroft were also fine.

There were not many seedlings exhibited and some of those

There were not many seedlings exhibited, and some of those shown would have been as well absent. Amongst the best was shown would have been as well absent. Amongst the best was a scarlet binarre exhibited by Mr. B. Simonite, a beautiful flower with the purest striping perhaps ever seen. In crimson binarres Mr. J. Booth exhibited a promising flower. In scarlet flakes Mr. B. Simonite, Mr. J. Booth, and Mr. J. Fletcher, exhibited a promising flowers. In rose flakes Mr. B. Simonite exhibited a large flower with fine petal, but this variety will perhaps come somewhat short of colony in fine scarces. sarge hower with line petal, but this variety will perhaps come somewhat short of colour in fine seasons; and Mr. Gorton also exhibited a promising flower. In purple flakes Mr. B. Simonite exhibited a fine flower; Mr. John Fletcher also staged a fine large flower in this class. In seedling Picotees there was nothing striking, the best were those exhibited by Mr. B. Simonite and Mr. John Fletcher. Miss Chadwick, which was certificated at a former exhibited at that time exhibited at that time.

In the classes for six dissimilar varieties not one stand was exhibited, and several of the small growers stated that they would not have a flower for a fortnight. Mr. Rudd's plants will not be in full bloom for three weeks. Mr. Lord of Todmorden, whose in full bloom for three weeks. Mr. Lord of Todmorden, whose situation is very late, has no flowers expanded. Mr. Gorton exhibited a stand of self flowers which deservedly obtained an extra prize. Selfs no doubt will become a feature in our northern shows as they are in the southern, and the ladies generally seemed to admire them the most. The flowers were of high merit, not sawedged as are frequently to be met with in stands of selfs. Appended are the awards of the Judges.

Class A, twelve Carnations dissimilar.—First, Mr. B. Simonite,

Bough Bank, Sheffield, with seedling R.F., large; seedling &B., Dr. Foster, very fine; James Taylor, Mayor of Nottingham, seedling a.B., extra fine; Squire Meynell, J. D. Hextall, Sportsman, seedling a.B., extra bright and fine in colour, with a good petal; and Dan Godfrey. Second, Mr. J. Booth, Failsworth, near Manchester, with Lord Nspier, Squire Meynell, seedling C.B., Clipper, nice; seedling a.F., large and fine; True Briton, seedling a.F., Admiral Curson, Fanny, Mayor of Nottingham, and John Keet. Third, Mr. George Rudd, Underoliffe, Bradford, with Mercury, extra large; Sybil, Sarah Payne, seedling P.F., Dr. Foster, Marshall Ney, fine; Lord Milton, Admiral Curzon, extra fine; John Keet, James Taylor, Mr. Battersby, fine. Fourth, Mr. Thomas Mellor, Ashtonunder-Lyne.

nder-Lyne.

Class B, twelve Picotees dissimilar. — First, Mr. Booth, with Miss Wood, William Summers, very good; Countess of Errol, Mrs. Keynes, Picco, Clars, Medina, fine; Miss Sewel, Miss Horner, very fine (selected for premier); Alice, Mrs. Lord, fine; and Lord Valentia, extra fine. Second, Mr. B. Simonite, with Miss Wood, Ann Lord, seedling H.R., Mrs. May, Picco, Violet Douglas, Fanny, Teresa, very good; Juliana, Mrs. Allcroft, Mary, and seedling L.R. Third, Mr. George Budd, with J. B. Bryant, Obadiah, Rev. F. D. Horner, Miss Wood, Jessie, Master Norman, Zerlina, seedling H.R., Norfolk Beauty, Mrs. Fuller, very good; and Isabella.

Class C, twelve Carnations, not less than nine dissimilar varieties. —First, Mr. R. Gorton, Eccles, near Manchester, with John Keet, extra fine (afterwards selected as premier Carnation); James Douglas, Mars, Sybil, James Taylor, Dr. Foster, J. D. Hertall, very fine; Admiral Curson; Sarah Payne, good in colour; and Garibadii. Second, Mr. John Fletcher, North Brierley, near Brafford, with seedling P.F., very large; Sybil, Sarah Payne, seedling

Ctaribaldi. Second, Mr. John Fletcher, North Brierley, near Bradford, with seedling P.F., very large; Sybil, Sarah Payne, seedling P.F., large; Admiral Curzon, fine; Dr. Foster, Mars, Sportsman, J. D. Hextall, Lord Raglan, very good; and Clipper. Third, Mr. William Slack, Chesterfield, with Lady Ely, Mars, Sarah Payne, extra good; James Taylor, Mayor of Nottingham, Unknown R.F. (like Flora's Garland), Dreadnought, James Douglas, and Squire Meynell. Fourth, Mr. Joseph Chadwick, Dunkenfield. Fifth, Mr. James Sharp, Perry Bar, Birmingham. Sixth, Mr. C. Auskland, Chesterfield. Chesterfield.

Chesterfield.

Class D, twelve Picotees, not less than nine dissimilar.—First, Mr. R. Gorton, with Miss Horner, fine; Mary, Miss Wood, Resy Queen, Her Majesty, Purity, Emily, Mrs. Lord, Rev. J. B. M. Camm, Juliana, and Princess of Wales. Second, Mr. John Fietcher, with Obadish, Alice, Branette, Rev. F. D. Horner, seedling L.P., Master Norman, J. B. Bryant, seedling H.R., Miss Lee, Zerlina, Miss Wood, and Morna. Third, Mr. Slack, with Violet Douglas, Mr. Small, Miss Horner, Mrs. Alteroft, Fanny Helen, and Juliana. Fourth, Mr. Thomas Mellor; fifth, Mr. James Sharp; sixth, Mr. C. Auskland, Chesterfield, with nestly all seedlings. Seven stands were exhibited in this class. A special prize was awarded for a were exhibited in this class. A special prize was awarded for a stand of twelve selfs exhibited by Mr. Gorton. Class E six dis-

were exhibited in this class. A special prize was awarded for stand of twelve selfs exhibited by Mr. Gorton. Class E, six disminilar Carnations, and Class F, six dissimilar Picotees.—None were exhibited, most probably owing to the lateness of the season. Classes for single blooms.—Scarlet Bisarres.—First, Mr. G. Rudd, with Admiral Curson; second, Mr. John Fletcher, with Mercury and Admiral Curson; fifth, Mr. Fletcher, with Admiral Curson; sixth, Mr. B. Simonite, with Dreadnought. Crimson Bizarres.—First, Mr. B. Gerton, with J. D. Hextall; second and fourth, Mr. Simonite, with the same variety; third, Mr. G. Rudd, with Captain Stott; fourth and fifth, Mr. John Fletcher, with J. D. Hextall; sixth, Mr. J. Booth, unknown. Piak and Purple Bizarres.—First and second, Mr. B. Simonite, with James Taylor; third and fifth, Mr. Stack, with Sarah Payne; fourth and sixth, Mr. R. Gorton, with James Taylor and Sarah Payne. Scarlet Flakes.—First, Mr. John Fletcher, with seedling (good); second, fourth, and fifth, Mr. J. Booth, with two blooms of Sportsman, and Pilot; third, Mr. J. Both, with James Cheetham; sixth, Mr. R. Gorton, with Clipper. Rose Flakes.—First and second, Mr. B. Simonite, with seedling; third, Mr. R. Gorton, with James Merryweather; fourth, Mr. T. Mellor with the same variety; fifth, Mr. J. Chadwick, with John Keet; sixth, Mr. G. Rudd, with Maid of Athens. Puple Flakes.—First and fourth, Mr. Simonite, with Dr. Foster and Squire Mervell! second and sixth Mr. R. Gorton with Dr. Foster and Squire Mervell! second and sixth Mr. R. Gorton with Dr. Foster and Squire Mervell! second and sixth Mr. R. Gorton with Dr. Foster and Squire Flakes .- First and fourth, Mr. Simonite, with Dr. Foster and Squire Meynell; second and sixth, Mr. B. Gorton, with Dr. Foster and Squire Meynell; fifth, Mr. J. Booth, with Dr. Foster. Heavy Red Picotees.—First, second, and sixth, Mr. G. Rudd, with two blooms Picotees.—First, second, and sixth, Mr. G. Rudd, with two blooms of J. B. Bryant and Morna; third and fifth, Mr. John Fletcher, with J. B. Bryant; fourth, Mr. J. Booth, with Lord Valentia. Light Red Picotees.—First and third, Mr. B. Simonite, with Violet Douglas; second, Mr. John Fletcher, with Thomas William; fourth and fifth, Mr. J. Booth, with Clara; sixth, Mr. G. Rudd, with Thomas William. Heavy Purple Picotees.—First and third, Mr. J. Chadwick, with Miss Chadwick; second, Mr. Sharp, with Emily; fourth, Mr. B. Simonite, with Mrs. May; fifth, Mr. C. Auckland, with a seedling; sixth, Mr. J. Booth, with Ann Lord and Alice; second, Mr. B. Simonite, with Ann Lord; third, Mr. R. Gorton, with Cynthis; fourth, Mr. Sharp, with Crystal Palace; sixth, Mr. T. Mellor, with Mary. Heavy Rose Picotees.—First and fourth, Mr. R. Gorton, with Miss Horner and Rosy Queen; second, Mr. T. Mellor, with Mrs. Ford, third Mr. George Rudd with a seedling fifth and sixth, Mr. John

Fletcher, with Rev. H. Matthews and Edith Dombrain. Light Rase or Scarlet Picotees.—First and fifth, Mr. J. Booth, with Miss Wood and Bertha; second and sixth, Mr. B. Simonite, with Miss Wood and Mrs. Allcroft; third and fourth, Mr. T. Mellor, with

Premier Carnation.-Mr. R. Gorton, with John Keet. Premier

Picotee.-Mr. J. Booth, with Miss Horner.

POTATO CULTURE—SMALL SETS.

PLANTING a large piece of ground each year with Potatoes for domestic use, I have often been surprised at the size of seed Potatoes thrown aside when preparing the sets, and I have been oftentimes assured that planting small Potatoes is only a waste of time and ground. This year I tried the following experiment: I picked out 120 Potatoes of the size of marbles, weight 1 fb. I saw them planted 4 inches apart on the 18th March, and on the 18th August I saw them dug up. There were 454 Potatoes in number, of which 220 were fit for use or sale; 100 were of the size of pigeon's eggs; 106 small marble size, or like the original sets; 28 diseased. Variety, Myatt's Prolific Ashleaf.

Last November a gentleman gave me a specimen Potate like Paterson's Victoria, but with a more silvery skin; it weighed 3\(\frac{1}{2}\) ozs. I divided it into four pieces which were planted 12 inches apart. Produce, forty good size Potatoes and four small tubers; weight 6 lbs. No disease.—H. C.

HALLAMSHIRE FLORAL AND HORTICULTURAL SOCIETY .-- AUGUST 20TH AND 21ST.

The twelfth annual Exhibition of this Society was held on the The twelfth annual Exhibition of this Society was held on the above dates at Ranmoor, Sheffield, in a field lent for the purpose by Eark Firth, Esq., who also kindly allowed his gardens and greshouses to be thrown open to all those visiting the Skew. The weather was very unfavourable to the Show proving a finucial success, as rain continued falling during the greater part of the time the Exhibition remained open to the public. The quality and greative of the archibit ware with some for minor very restriction. and quantity of the exhibits were, with some few minor exceptions,

quite equal to those in previous years.

The large tent devoted to the gentlemen's gardeners' classes contained some fine collections of stove and greenhouse plants, and presented a very attractive appearance. In the class for six stove or greenhouse plants Mr. T. Shelley, gardener to Mrs. Hobson, was first with a very fine group, the principal features of which was most with a very line group, the principal reatures of which were good specimens of Ixora cocoinea superba and Bougainvillea glabra, and also an excellent Miltonia spectabilis. In this same class Mr. Stephens, gardener to Sir John Brown, and Mr. Walker, gardener to B. P. Broomhead, Esq., also exhibited; Mr. Stephens staging two remarkably large and well-flowered plants of Hydragea hortensis, some good specimen Palms, and a fine Croton interruptus. Mr. Walker brought Allamanda Hendersoni and Clerodendron Balfourianum, both very fresh and finely bloomed. Ferns were well shown and in large numbers, principally by the

Ferns were well shown and in large numbers, principally by the same exhibitors as before named. Mr. Walker brought a grand sense exhibitors as before named. Mr. Named brought a grand perimen of Adiantum farleyence, such as has rarely been equalled at any show. Fuchsias and Zonal Geraniums were shown in good condition by Mr. T. Foggin, gardener to Mrs. G. Wilson, who, as is small with him, was first in each of these classes. His style of growing these plants is greatly in advance of what we usually

meet with in provincial shows.

nest with in provincial shows.

Fruit was shown in excellent condition by Mr. J. Keeling, gardener to D. Ward, Eeq. (the Mayor). His black and white Grapes were splendid, and attracted much attention. Some good Peaches were staged by Mr. W. Stephens. Vegetables were good throughout, especially Cauliflowers, Peas, Potatoes, Turnips, Cacumbers, and Tomatoes.

The tent occupied by the amateurs and cottagers was remarkable for the number of very fine collections of hardy and British Ferns exhibited by the amateur growers. Mr. J. Eadon, who held the premier position in this class, is the Chairman of the Show Committee, and he has been for many years past a very successful and enthusiastic cultivator of hardy Ferns, and the example set by him seems to have induced many more amateur example set by him seems to have induced many more amateur

growers to take up the cultivation of these plants.

The absence of one of the best fruit cultivators in this neighbourhood (Mr. D. Abbot, gardener to C. H. Firth, Req.), who has in former years almost invariably occapied the foremest position in most of the fruit classes, was much regretted. It appears that his employer has from some cause taken an objection to exhibiting, which is unfortunate, as the fine examples of fruits each year presented by his gardener did much to stimulate other gardeners to greater exertions, and to promote a healthy feeling of rivalry and competition.

WALTHAM CHOSS VINE.—I have had one in full bearing for three years, but it is far from satisfactory. The bunches

are a splendid length, but not one-half of the berries attain their full size, and if these were cut out the bunch would be a miserable object. Do those who are acquainted with this Vine advise me to grow it on or replace it by a better ?—A. K. C.

SLUGS AND SNAILS.

SLUGS have been exceedingly troublesome this year. I have heard it said that the former are not so numerous after a severe winter. I have doubted the correctness of that assertion for some time past, and now I am quite convinced it is wrong. In a severe winter they descend farther into the ground, and there remain in safety; but in mild winters come to the surface occasionally, and are killed by sudden frosts. Snails, I believe, are reduced by a severe winter, at least I find such to

I had two rows of Sangster's No. 1 Pea quite destroyed by alugs this season, although I dusted them well with lime on several occasions; they seemed eaten below the ground as well as above, and other Peas were much injured, whilst a neighbour had not a Pea touched. He had a fancy that salt was a good manure for land, and gave a dressing to all his land (which was uncropped) and dug it in. Whether it did much good as a manure I cannot say, but it had a most beneficial effect, for he had not a slug in his garden. The quantity of salt used was just enough to cover the ground, as though there had been a slight fall of snow. I shall certainly adopt the plan next spring, but it is necessary to be careful when the land is cropped.—AMATEUR, *Oirencester*.

IF it had not been for the sluggishness of my newsman I should have acknowledged last week the kind responses of your correspondents "G. H. V.," "W. J. M., Clonmel," and

Mr. C. P. Peach.

"G. H. V." recommends plovers with their wings clipped, but how can I keep them in a garden which is not walled in on all sides? "W. J. M." advises me to procure a clutch of ducklings. Years ago I did that, and found them of great service, especially under my Gooseberry bushes; but they wanted some salad and dessert after their meat, and consumed a quantity of young Lettuces and Strawberries when I thought they were enjoying their siesta, as the Spaniards call the pleasant slumber after a sumptuous meal.

The ducklings were especially useful under my Gooseberry bushes. When I scratched with a rake the soil under a Gooseberry bush as deep as I could the ducklings went at it, or at what they found in it, sitting down round the tree. I repeated what they found in it, sitting down round the tree. I repeated the operation to other Gooseberry trees. The result was that before I had done ten trees the ducklings said, as plain as ducklings could speak, "their programme was full." They enjoyed it, and did good, for there was not a single caterpillar on those bushes the following season. But to return to the sings. I have been trying some experiments. I exhibited, as our doctors say, a mixture of creosote and water. It evidently was disagreeable to both slugs and snails, and killed the smallest.

I have made further experiments with nitrate of soda, and think it may be used with "killing" effect considerably diluted. Have any of your readers tried a solution of nitrate of sods and water? Say how many ounces to thirty gallons of water. Will Mr. C. P. Peach kindly inform me what proportion of carbolic acid, solid or in a diluted form, to mix with, say, ten, twenty, or thirty gallons of water? I have found 2 ozs. mixed with thirty gallons of water very useful for bringing worms to the surface of a lawn; if stronger it killed them, or more probably merely paralysed them below the surface, for they came up as strong as before a few hours after. The diluted dose appeared to disagree with them, but they came to the surface and were left to the mercy of the gardener. Which face, or a weaker one sufficient to compel them to come to the surface to be killed? Can any of your readers tell me the result of gas lime, and what weight of it to lay on a given area?—G. O. S. is the best-a strong solution to kill the slags below the sur-

ROSE VERTE, OR GREEN ROSE.—About fifteen years ago, when I was at New Orleans, United States, I saw in several gardens a Rose in flower the blooms of which were of a pure green colour. The flowers were about the size of those of Aimée Vibert. It was considered a curiosity, but not a rarity. Unfortunately I could not bring either a plant or cutting, for I was en route for a long tour through Texas and the other

Southern States; but if any of your readers wish to have plants of it I have no doubt it can easily be obtained from some of the florists there. In no part of the world have I ever seen Tea Roses growing so luxuriantly and flowering so gloriously as in the neighbourhood of New Orleans.—G. O. S.

PARAFFIN-NEWTON'S SEEDLING STRAWBERRY.

In reply to Mr. William Taylor's recommendation of paraffin as an insecticide I must repeat that paraffin is not soluble in water, as I have proved by trying it both with hot and cold As to his caution not to let the sun touch water, soap, &c. plants while wet with it, I would ask-How is this to be prevented if it takes a whole day, or two whole days, for the sticky oily substance (I use Mr. Taylor's own words) to dry? In this gloomy season we have plenty of sudden bursts of sun, which in my light houses would very soon destroy any tender which in my light houses would very soon destroy any tender leaf touched with paraffin. But why use paraffin at all? Carbolic acid is soluble in water, and mixed with soft soap and a little brimstone will destroy thrips, red spider, or any other insect pest. Where mealy bug exists the best remedy is methylated spirits applied with a camel's-hair brush, or better still methylated spirits mixed with turpentine and water, and syringed off afterwards with pure water.

In answer to "AN OLD GROWER" I do not quite know the origin of Newton's Seedling Strawberry, but it quite corresponds to his description. I had it from Mr. Harcourt's garden at Whitwell. The quality, as far as flavour is concerned, is not particularly good, but it is very firm, produces very good-looking fruit, and some very fine, but its great merit is its prodigious bearing qualities. I cannot endorse your correspondent's remarks on the method of growing Grove End Scarlet. It is no use going back to inferior methods, nor is there any

necessity for so doing.

The suggestion of "G. O. S.," of using straw bottle holders and masons' laths, is good in its way, but the plan would not do on a large scale. Nothing is simpler than chopped straw for protecting the fruit.—C. P. PEACH.

ROYAL WESTERN HORTICULTURAL SOCIETY. PLYMOUTH .- AUGUST 19TH AND 20TH.

THE forty-second annual summer display of this popular Society was held in the Hoe Park, Plymouth, on the above dates, and as it was remarked at the Judges' dinner, the Society never had a better exhibition and worse weather. It rained incessantly on the first day, and the visitors were so few as to almost dishearten the hard-working executive; but on the second day the weather improved, and the visitors flocked in such numbers that in the evening the tents were crowded, and several pounds in advance of last year were taken at the gates.

evening the tents were crowded, and several pounds in advance of last year were taken at the gates.

The exhibits were arranged in four large marquees, the schedule consisting of eighty-nine classes besides several special prises. The principal class (open) was for twenty specimens of stove and greenhouse plants, half in flower, three exhibitors competing. The first prize was awarded to Mr. Cole, gardener to J. Lawless, Esq., St. Leonard's, Exeter; the second to Mr. Salway, gardener to H. B. Mildmay, Esq., the President of the Society; and the third to Mr. Rowe, gardener to F. Parkin, Esq., Exeter, all exhibiting well. Mr. Cole also took the borough Members' prize for twelve stove and greenhouse plants, and was also fortunate in twelve stove and greenhouse plants, and was also fortunate in obtaining several other first prizes—namely, for six Ferns, for a single specimen foliage plant with a magnificent example of Oroton Disraeli, for a greenhouse plant with a large Phormium tenax variegatum, for a Fern with Davallia Mooreana, and for a single Heath with a fine plant of Erica Jacksoni.

Heath with a fine plant of Erica Jacksoni.

In the class for six stove and greenhouse plants Mr. Rowe occupied the first position, although followed very closely by Mr. C. Warren, gardener to J. Bulteel, Esq., Pamphlete. Mr. Salway and Mr. Brighton, gardener to the Earl of Mount Edgcumbe, exhibited excellent groups of stove and greenhouse decorative plants. Balsams, Fuchsias, Coleuses, and Mignonette were all exhibited largely and well. Good Achimenes came from Capt. Tolcher; while Messra. Hender & Sons staged a splendid collection of their fine Amaranthus Henderi and Princess of Wales, besides the newer varieties of Coleuses in fine condition. Mr. besides the newer varieties of Coleuses in fine condition. Mr. Laing of Forest Hill exhibited a collection of Tuberous Begonias, which were very much admired.

The display of fruit was very good, and the vegetables were excellent. Mr. Dillon and his staff are to be congratulated on

their success.

Thuja Lobbi as a Hedge Plant. - At St. Fagan's Castle, near Cardiff, there is a maze of considerable extent, the hedges of which are formed of this Thuja, and it certainly

makes the prettiest hedge of any evergreen I ever saw. It is kept closely cut, is about 4 feet in height, and its delicate green colour and pleasing surface point it out as being suitable for making hedges of the most ornamental description.—M.

CARNATIONS AND PICOTEES.—No. 8.

AUGUST .- When present at the National Show, southern section, I was so happy as to become introduced to Lady —, who spoke most enthusiastically of the Carnation and Picotee. From what she said I am inclined to think that many are in the same predicament as she is. She informed me that she purchased her plants in April, "packed up nicely as Cabbage plants are." The gardener also planted them carefully, and the result was no growth and no bloom. I will endeavour to describe how to have a good bloom in the open ground.

In the first place, if you have cold frames for wintering the plants in, autumn is the best time to procure them, say about the middle of October, when two plants should be placed in a pot 4 inches wide, the plants near the edge of the pot. The best compost for them is maiden loam (if strong mix some sand) with a small proportion of leaf mould and charred Drain the pots well to enable the water to pass away freely, otherwise the soil would become sour. with a rose immediately after potting; when the foliage is dry close the frame for a few days until the plants begin to emit fresh roots, when all the air possible should be given them, only keeping off the drenching rains. From this time until planting time they will require very little attention except protection in bad weather, and if very frosty, as last winter, covering the frames with a few mats; but at all times endeayour to provide a circulation of air through the frame some time during the day. At the end of February the plants should have a thorough cleaning, removing all dust and dead ends from the foliage. If the weather is open and the plants are dry give a good watering when growth commences. About the middle of March if the weather is fine the plants can be placed out in the beds or borders as required; after this they will only require ordinary attention, bearing in mind that a poor soil will give a poor bloom and vice versă.

Those who have not convenience for wintering the plants

will find it best to arrange with some grower, so as to have the plants in pots from him when wanted at planting time. Bear in mind only to deal with respectable dealers, otherwise the plants may prove to be anything but what was expected. The bloom from the plants will generally consist of only one spindle (flower stem) per plant, some varieties excepted bearing four to six flowers. Where large blooms are wanted thin the buds

down to two or three on each stem.

With regard to after cultivation see the monthly notes given in the Journal on the cultivation of plants in beds. Some varieties are very liable to have burst pods, and it should be the endeavour of the cultivator only to procure such sorts as

are not given to bursting.

WORK FOR THE MONTH.—Push forward the layering as fast as possible. Even in late districts, although the flowers may not yet have shown colour, layering had better be done at once, although there is no doubt that in many cases the stems will be too brittle for layering in the ordinary way. The only plan that can be adopted with safety is to layer a joint or two nearer the plant than in ordinary seasons. The result will be that the layers will be long, but this is better than having them badly rooted or not rooted at all, which might be the case if the operation be deferred. When layering before the plants are in flower it will be necessary to keep the layers belonging to each plant all together, so that if a plant proves to be out of colour the layers from it can be kept clear from the general stock, as many sorts when once run never come back to the florist type, although the plants may be grown for years.

All good flowers not required for exhibition purposes should be crossed for seed, keeping the bees from them until you are satisfied that impregnation has taken place, when a few of the petals should be extracted to give room for the swelling of the seed vessel, also splitting down the side of the calyx to its base and removing one of the segments from the lowest side, so as to prevent any water from lodging inside. As the tips of the calyx turn yellow and the seed vessel pushes forward they may be shortened, extracting the petals one by one as they decay, taking care not to injure the seed vessel whilst doing so. Bear in mind not to fertilise the flowers after the plants are layered, as it is very rare that any seed will be produced. Pay attention to the watering of the layers in dry weather, as they are easily affected if the weather proves dry, the roots of the plants in this stage being so near the surface.

Plants in Beds.—The same rule applies to them as to those in pots, only before commencing to layer it is a good plan to give the ground a thorough watering with lime water, which will generally destroy those small black slugs which are so troublesome to the cultivator. When grown in beds there is to necessity to layer all the growths, only peg them down to prevent the winds from breaking them off. The plan they adopt in the north when layers are not particularly wanted is to layer just a few of the plants that are full of young growth. These are removed when rooted, whilst the old stool is grown on through the winter, with the result that few of them are ever lost in the winter months, whilst being so strongly established they produce splendid bloom the following season after being cleaned and top-dressed in March. When the flowers are grown in this manner they call it growing them on the bush.

Seedlings.—Those who intend wintering these in the open should plant at once; but if intended to be wintered in frames they may remain in the boxes until October, when they ought to be placed in small pots (4 inches diameter), one or two plants in each according to the size of the plants. Any seedings which may have bloomed in the open ground and possess exceptional merits may now be taken up, potted, and in a day or two layered. My friend Mr. Dodwell tells me that he layered all his seedlings last year in pots and did not lose cone. To those who are infirm or too ponderous for ground layering it is a great boon to be able with certainty to propagate them in this manner.—GEO. RUDD.

THE DAMASK ROSE.

On the 31st July you inserted a letter from me in reference to the early history of the old double yellow Rose. I have since come across a passage relating to that of the Damask Bose, which I venture to send to you. It occurs in Lord Bacon's "Sylva Sylvarum," century vii., par. 559 (see Bohn's edition of Bacon's works, 1854, vol. i. p. 155): — "The coming of trees and plants in certain regions and not in others is sometimes casual, for many have been translated and have prospered well, as Damask Roses that have not been known in angland above a hundred years and now are so common." This extract is taken from a work written in the last five years of Lord Bacon's life, and consequently would carry back the introduction of the Damask Rose to some date between the years 1521 and 1526 A.D. The statement itself may not be sufficiently exact to establish the point, but Lord Bacon's habit of accuracy and his love of horticulture give it a distinct value. Haydn ("Dictionary of Dates," edition 1873) assigns 1543 as the date of introduction of this variety from southern Europe, but I know not upon what authority.

Besides the Damask Lord Bacon mentions in other places

three more varieties of Rose existing in England about 1597viz, single and double Musk Roses and red Roses (see Essay zivi. of Gardens, &c.). I cannot identify the latter; possibly it was the emphatic style by which in Lord Bacon's days the Rose dedicated to the Lancastrian party was still known. Can say of your readers solve the point?—J. FREDERICK HALL.

THE DEATH OF MRS. VEITCH.

WE regret to announce the death of Mrs. Veitch, of Stanley House, Chelsea, widow of the late Mr. James Veitch, the former proprietor of the great nursery business with which the entire sorticultural world is familiar. During the lifetime of her late husband Mrs. Veitch was well known to many who visited the establishment, and from the decease of Mr. Veitch in 1869 was the proprietress of the business together with her sons, Mr. Harry and Mr. Arthur Veitch. The deceased lady, whose loss is mourned by many beyond her family circle, had for a con-siderable time been in failing health, in consequence of which she had lately with her daughters been staying at Eastbourne, where she quietly and peacefully passed away on the 22nd inst., aged sixty-two years. By her removal an estimable family loses an honoured head, the numerous employes of the firm a real friend, and many a needy sufferer in the district a practical benefactor. Even far beyond what may be termed her home district Mrs. Veitch in a quiet manner rendered aid to many worthy objects, and she will be remembered for her wide sympathy with distress in every form, and her far-reaching

generosity. Besides her two sons the deceased lady leaves five daughters. The funeral took place yesterday (Wednesday) in the Brompton Cemetery, and was attended by a large number of sorrowing friends.

WORK FOR THE WEEK.

MUSHROOM HOUSE.

MUSHROOM beds for affording the winter supply must be formed without further delay. The most suitable materials are horse droppings direct from the stables. It is a capital plan to place a wheelbarrow under cover in such a position that the droppings can be placed in it. This, however, is not always practicable, in which case the shaking over of stable litter during dry weather should be continued until sufficient material is secured. strawy particles not only increase the bulk but aid in drying it and maintain the bed in a fresh state for a lengthened time. Expose the manure if possible in an open shed to dry, and when only sufficient moisture can be observed in it under pressure from only sufficient moisture can be observed in it under pressure from the hand as will admit of its being beaten into a compact mass it is ready for making up. If the beds are formed on shelves make them not less than 12 inches in depth, and they need not exceed 15 inches, beating the material very firmly so as to retain the heat, or it may be placed into the beds loosely to a depth of about 3 feet, allowing it to remain so until a gentle warmth is generated, then tread and beat it down as firmly as possible. When the temperature of the bed is steady at 75° make holes about 9 inches apart every way, and insert firmly in each a piece of spawn 9 inches apart every way, and insert firmly in each a piece of spawn about 2 inches square, and cover about an inch deep and beat the bed well over. In the course of a week or ten days the bed may be covered with about 2 inches of turfy loam of such a texture and moisture as can be beaten into a firm mass. In about six weeks the Mushrooms will make their appearance, when it will be necessary to keep the surface of the bed moist by sprinklings as necessary, avoiding overwatering.

FRUIT HOUSES. Figs.—In the earliest Fig house the trees will now be ripen-Figs.—In the earliest Fig house the trees will now be ripening their wood, and watering may be discontinued, air being admitted very liberally. If, however, the second crop is not yet ripened moderate moisture in the soil will be necessary with a rather free circulation of warm air to insure high quality in the fruit. We prefer placing trees in pots out of doors if the wood be ripe, but the season is so exceptional that the cultivator will require to exercise his independ; in either case encourage will require to exercise his judgment; in either case encourage surface roots by a top-dressing of decayed manure or crushed bones. In Fig houses where the trees grow too strong, producing routs, confining them to borders about 8 feet in width. If the bottom be well drained a top-dressing of rich turfy loam may be bottom be well drained a top-dressing of rich turry loam may be given after the root-pruning, with about a tenth of old lime rubbish and a sprinkling of bone dust; but if the border be not well drained or is too rich it will be preferable to lift the trees as soon as the leaves show indications of falling, root-prune them and replant in good soil. For drainage employ broken bricks and old lime rubbish about a foot deep, mixing about a tenth of the latter with good turry loam and a twentieth of crushed bones. The soil should be well rammed in about the roots. So much runing or stooping of the growths will not be required as much pruning or stopping of the growths will not be required as when the trees are growing in wide borders.

Vines.—The weather is extremely unfavourable for the ripening

of late Grapes, the borders being saturated with moisture outside, resulting in an undue amount of lateral growth and the swelling of the berries to an unusual size. Keep the laterals well thinned, and thereby admit as much light as possible to insure the finishing of the crop, not by large reductions of foliage at a time, but by frequent pinchings. Where spare lights are at hand employ them to throw off heavy rains and to secure greater warmth to the soil. This will not only assist the present crop to finish satisfactorily, but will help to secure the ripening of the wood. Fires will be but will help to secure the ripening of the wood. Fires will be necessary to maintain a night temperature of 70° to 75° at night and 80° to 85° by day, accompanied with a free circulation of air night and day, as it will require sharp firing to finish off late Grapes before the days are too short to admit of its continuance; indeed more may be done in the next six weeks than in twice the time later on. Those Grapes well advanced in ripening may have the atmospheric moisture gradually reduced; those only colouring should have a moderate amount of moisture to assist their swelling, not neglecting the inside borders for water as may be necessary. Lete Grapes are so backward that without extra attention to firing and ventilation they will never ripen. Vines from which the Grapes have been cut must not be overlooked. All laterals should be closely stopped, and a dry warm atmosphere maintained to be closely stopped, and a dry warm atmosphere maintained to secoure the thorough maturation of the wood, preserving the old leaves as long as possible, giving an occasional washing with the engine on fine evenings to free them from red spider. Grapes hanging should have a circulation of dry air secured to them by gentle firing as may be necessary during the day only, examining the bunches frequently for shanked or decayed berries.

Peaches and Nectarines.—The fruit in the latest houses will

require artificial heat, and the watering at the roots must only be moderate, though sufficient to maintain the foliage in a healthy Much gross wood is being made by trees in late houses. Laterals must be stopped, as that is preferable to removing many shoots, which might cause other buds to start into growth. As trees in succession houses become cleared of fruit thin out all shoots not required, in order that they may have the benefit of all the sun and air possible to thoroughly mature the wood, going over the trees with the garden engine to cleanse them as far as possible from red spider, not neglecting the inside borders for water. Gentle fires will be advantageous, where the wood is strong and

the situation cold and damp, for securing matured growth.

Pines.—Suckers from the summer-fruiting plants will soon need repotting, shifting the strongest into their fruiting pots as soon as they are ready, affording the plants a position near the glass in a light airy house where they are kept gradually growing during the winter months. They start readily in May or June, and yield a supply of fruit for early autumn use. The remainder of the yield a supply of trult for early autumn use. The remainder of the plants may be wintered in 7 or 8-inch pots, and transferred to the larger size pots in spring, and with strong suckers of Smoothleaved Cayenne and Charlotte Rothschild started last March will provide a succession of fruit throughout the winter months, aided by Queens and other varieties which were started at the same time. About this time it will be necessary to effect a re-arrangement of the plants that were started last autumn. Many of the free-fruiting kinds will have fruit swelling off, and such plants should be separated from those not now in that con-dition, but which have completed the growth. These plants will mere readily start into fruit at the required time if subjected to freer ventilation for the next six weeks than if kept in an atmosphere conducive to growth; therefore ventilate freely when the temperature of the house exceeds 80°, with a mean of 80° at the roots. Where fruit is swelling off keep the air moderately supplied with moisture, admitting a little air early in the morning to promote evaporation before the sun's rays fall directly on the fruit. Ripe fruits required to be kept should be removed to a shady

house having an abundant supply of air.

Orchard House.—Apricots are fully a month late in ripening. The midseason Peaches are usually about this time fully ripe, but excepting the very early varieties, such as Early Beatries and Early Louise, none have as yet ripened. All fruit trees whether in pots or planted out should be kept somewhat drier when the fruit is approaching maturity, but the moisture at the roots must not be so reduced as to affect the foliage, and syringing must cease. It is desirable to place trees with the fruit ripening forether in a root of the house have the meaning and the thouse have the results as that there together in a part of the house by themselves, so that those not in that condition may be syringed as required, whilst the others are kept dry. Although abundance of air is advisable when the fruit is ripening a departure must be made from the rule this season, otherwise many fruits will never ripen perfectly; therefore continue to close the ventilators early in the afternoon; 85° or even 90° from sun heat will do no harm, provided air has been given in the early part of the day and a little is again admitted at night to prevent a stagnant or vitiated atmosphere. Little pinching or stopping of shoots will now be required, although gross shoots may occasionally be developed, and they should be stopped or removed altogether. As the fruit is removed from the trees they will require to be repeatedly syringed to free the foliage of insect pests, and waterings at the roots must be given as required to maintain the leaves in good condition.

FLOWER GARDEN.

The early summer was particularly unfavourable to the deve-lopment of flowers on such plants as Pelargoniums, and the growth of the more tender plants employed in the subtropical garden and elsewhere has likewise been retarded. Although the summer has been so unfavourable to the class of plants ordinarily employed as summer bedders, herbaceous plants have been unusually attractive, and it is much to be regretted that the modern system of flower gardening has caused encroachments to be made on the mixed border almost to the extent of pushing se interesting and beautiful a class of plants out of cultivation. Mixed borders of various flowers afford far more satisfying pleasure to the real lover of flowers than masses of colour. In seasons like the present much might be written in favour of carpet bedding; the plants employed are bright and very effective. The propagation present much might be written in favour or carpet beauing; the plants employed are bright and very effective. The propagation of bedding plants should now be pushed on as fast as possible. Insert Pelargonium cuttings at once, as the earlier they are struck the safer they will pass the winter. A few store pots or pans of Verbenas, Lobelias, Heliotropes, Ageratums, &c., will, if safely wintered, afford an abundant supply of cuttings in spring, and plants propagated in spring of those and similar plants are preferable to older plants.

PLANT HOUSES.

PLANT HOUSES.

Greenhouse.—The latest-flowered Pelargoniums should now be cut down as advised for the earlier plants, allowing them to become dry previously, placing them at once in a pit or frame. The earliest cut down plants must be shaken out before the shoots are too far advanced, or the reduction of their roots will give a check to the after growth. Reduce the roots considerably in the case of old plants that are as large as desired; but any that are small

need not have the roots reduced so much. Pot in turfy loam, need not have the roots reduced so minds. For in tury near, adding about a sixth of well-decayed manure, thereughly incorporating sufficient sand to keep the soil open. Pelargoniums can hardly be potted too firmly; place the plants near to the glass in a light pit or house, syringe every afternoon, and afford plenty of air. Old plants of Cyclamens should be turned out of the pota and have the drainage rectified if defective.

TRADE CATALOGUES RECEIVED.

James Carter & Co., 287 and 288, High Holborn, London,— Illustrated Catalogue of Bulbs and other Plants. Sutton & Sons, Reading,—Illustrated Bulb Catalogue and Lists of

lants and Seeds.

Bulbs and Roses. Stephen Brown, Weston-super-Mare.—Catalogue of Bulbs and

other Flowering Plants.
Louis Van Houtte, Ghent, Belgium.—Catalogue of Rhodeles drons and Azaleas.

TO CORRESPONDENTS.

* * All correspondence should be directed either to "The Editors" or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

YELLOW PLUMS FOR SOUTH-WEST WALL (H. T. C.).—The Jefferson Plum will probably suit you. The tree is a free grower and good bears, and the fruit is large and of excellent flavour.

POTATOES DECATING (J. B., Berks).—Your Ashless Potatoes are, we fear, like those of many others, smitten with the murrain. We knew of no better means of arresting the disease than spreading the tubers out thinly in a very dry place. Some gardeners dust the Potatoes with lime, which may be useful in drying up excessive moisture.

BUDDING ROSES (D. Jenitas). — Provided the bank of the Briar or Manotti stocks "rums" freely you may insert the bads new. We have budded many Roses in September successfully. The bads remain domain until the spring and then grow strongly. The bads starting now are very liable to be destroyed, as the growth cannot be matured before winter.

PRACH TREE OVERGROWDED (A Young Gardener).—You may one out some of the strongest growths at once, so that those that are of maximum strength, shorter jointed, and which give promise of forming fruit buts plentifully, may have more light and air to mature them. If the tree is vary luxuriant we should lift it, or at any rate root-prume it, raising some of the more fibrous roots and placing them near the surface in fresh soil, premise the soil very firmly. You may do this at once, and if bright weather should follow you can easily shade the trellis for a few hours as required to keep the follow fresh but if these process are produced. the foliage fresh until fresh roots are produced.

the foliage fresh until fresh roots are produced.

INCREASING PANSIES (Suburban).—As the season has been so dull and
wet you will probably find that the young growths issuing from the steams
of the plants have roots at the base. These roots side shoets should be
slipped off when they are about 2 inches in length and planted in a bad
in a rather shaded position but not under trees, and you will soon have
healthy young plants. Side shoots thus have not roots will, if inserted in
very sandy soil and protected with a handlight, emit roots readily if the
cuttings are shaded for a time and kept moist. They must be taken off
and inserted when quite young and fresh, for if their stems are hollow and
flowers are showing very few of the cuttings will strike.

Willy the strike of the strike in the st

WINTERING COLEUSES (L. A., Bradford) .- You cannot pres wintering coleurs (L. A., Bradford).—You cannot preserve Coleurs in a greenhouse having a minimum temperature of 40° is the winter. They are stove plants and require a temperature of the less than \$5° to winsight them successfully. As the varieties you have purchased are good, and at your means for preserving them are so inadequate, you had better ask a neighbouring gardener having a plant stove to accept a few cuttings now. These will strike readily, and will not take up much room in the winter, and will afford an ample supply of cuttings for spring propagating. Propagating Ritonyrustrate (L. March). The propagating of what

PROPAGATING BUONYMURES (J. Mason).—If you extent entitings of shell-jointed tolerably firm shoots, not sappy growths, about 5 inches in length, and insert them firmly 3 inches deep in sand under a handlight, or in pots to be kept close in a frame, the sand to be constantly mosts, most of the cuttings will strike, and if they are potted in good but rather light sail will speedily form attractive little plants.

AMPHLOPSIS VEITGEII NOT COLOURING (Perplexed).—The very means you have adopted to induce the foliage to assume the rich crimson glow that is so much admired have prevented the foliage colouring. "A rich, deep, and well-manured site with liquid manure occasionally" would promise the plant's growth and retard the colouring of the foliage. This plant nexer colours so well see when grown in very firm and not rich soil, and is a sunny situation. As your plant attains age, and has space to extend itself, it will no doubt assume its bright autumnal garb.

(I.I.B. ROOF, IN CLEMANS (C. 2) AMPHLOPSIS VEITCHII NOT COLOURING (Perplesed).—The very more

CLUB ROOT IN CARRAGES (G. D., Walton-on-Themes).—The specimens submitted are backly affected with this disease, but if our memory server as these you sent before were as bad or weres. It is strange that the plants should be more generally attacked this season, as dry weather is usually favourable to the increase of the weerli, the larve of which constitute the disease known as ambury by feeding on the soft portion of the root, thus inducing the warty and swellen appearances characteristic of its pressure. Frequent transplanting is a remedy if attention be paid to removing the small warts from the roots, which can easily be done when they see in a young state. Good dressings of character dust or soot pointed in with the

sade would be found very beauticial, and in some cases they have proved effectsal remedies. The application of gas lime in small quantities has also here recommended for the destruction of the larva. If applied in the saring from four to five bushels per acre should not be exceeded; but if employed in the autumn it may be spread on the ground at the rate of trenty bushels per acre, and be dug in and well incorporated with the soil in the spring. We have recently seen a garden from which clubbing has been in a great measure extirpated by the adoption of the practice last mustioned.

mentioned.

BROWER AND SILVEB-LHAVED PELARGORIUMS FOR BEDERIG (Agricola).

The following are varieties of proved worth:—Silver-lessed—Princes
Alsomatra, Miss Kingsbury, and as a dwarf grower Little Trot. Flower of
Spring, with creamy variegation, is also an excellent bedder. Bronze-lessed

Mandehal McMahon, Black Douglas, Bev. C. P. Peach, and as a dwarf for
explays Golden Harry Hisover. The manure you name and your proposed
made of applying it will be good for all the plants to which you refer.

Buses or apprying it will be good for all the plants to which you reser.

BURCAT GRAPES DEOPPING (R. P. B.).—Brocessive modesture is the came of the partial decay of the Grapes. The berries that are sound are unusually unterly and deficient in flavour. The Vines appear to have been well sameged so far as the low size of the border and an unusually wet season have allowed, for the bunches are full and the berries regular. There is no meetly but intercepting the water that drains from the higher part of the garden and preventing its reaching the Vine border. It will be well, however, to employ fire heat so as to maintain a warm and dry atmosphere in the beam, with a free circulation of air. Although the water has always drained to the Vine border in past-seasons it has probably never been in such quantities as during the present year.

PROPAGATING LAURRISAND YEWS (A Constant Reader).—Laurel cuttings should be taken of the current year's growth with a joint or two of last year's, inserting them about two-thirds their length in a sheltered situation, making the soil very firm around them. They should be inserted at the close of September or early in October. Yew cuttings should be taken off with a best of the previous year's growth, and be divested of the leaves half way up the cuttings, to which extent they should be inserted in sandy loam surfaced with and, which may be done now, the wood being firm; or the ripened growth may be inserted in April, choosing a shady border. No artificial hast is meccanary.

GRAPES CHAMKING (H. T. H.).—The wet season has caused an excess of matrimum available for the production of foliage and the swalling of the baries, which now that the Grapes are ripening is more than can be assimilated, and this causes the skin to burst. This is one cause of the fruit cracking, and in this case the evil may be remedied by keeping the laterals observed supped as a to cheek eved-autension and admit of the foliage being mere fully exposed to light and sir; thereby increasing its evaporative power; also est the shoots about helf way, through below the bunch, which will asset the flow of the sap to the fruit. Cracking may also result from a too moist and continuous growth. The remedy is to admit air freely, a circulation of rather dry warm air being easential to the perfecting of most kinds of Gespas, and especially for those limbs to this defect. Employ gentle fires to scoure a dry atmosphere by liberal ventilation, employing any spare lights if possible to thew off heavy raths from the border, or failing these tarpanin or wood shutters would answer.

Fig CLLTURE (Ego).—The growths should be sufficiently thin so that the sun and air can have free access to them to ripen the wood. If the trees grow inxuriantly dig them up in early October, and shorten the strong roots, applanting in rather poor soil, the site being well drained and the soil rammed way firmly about the roots. Unless you can secure abort-jointed and well-tipuned wood you will not succeed in growing the trees as standards. You can have the number to which you refer by sending \$1\text{d}\$, in stamps to the publisher.

can have the number to which you refer by sending \$\frac{1}{2}\$d, in stamps to the publisher.

Things Unpriumpul. (C. F.).—We suspect your Catillac Pear tree is too much crowded with wood and foliage. Thin out a portion of the instance is much crowded with wood and foliage. Thin out a portion of the instance is much and to not shorten the others materially. If the tree grows luminantly dig a trench half round it at about 4 feet from the stem, severing the roots, which, however, should not be left in a jagged etset, but should be estimated him to be severance of any roots that are penetrating the subsoil; indeed, dig the tree half up in October. If this does not prove sufficient to check over-inxuriance and promote fruitfulness repeat the process on the other side of the tree half up in October. If this does not prove sufficient to check over-inxuriance and promote fruitfulness repeat the process on the other side of the tree half up in October. If this does not prove sufficient to check over-inxuriance and promote fruitfulness repeat the process on the other side of the fruit thin early severage, which you can heep there by an annual bonders. In g of manure. There are two causes of Pears cracking—one a wet unconsmissionable in the other indements weatherful the spring, injuring the cuticle of the fruit when it is in a tender state. The Warner's King Apple tree treat similarly—that is, root-prune and thin out the shoots, but do not shorten those that remain, or only shorten them slightly for the cake of symmetry. This variety generally grows rather strongly. The wall Plum tree that has grown will require hold treatment to bring it into a fruiting state. Out of the growth above the wall, and also all the leage spure, leaving only have main stems at regular intervals of about a foot apart. In the surge these will be treatment on the term of the interval of about a foot apart. In the surge we have been allowed to the wall, and also all the leage spure, leaving the remainder, only leaving those of medium strength an

CHLYERWELL'S TELEGRAPH PEA (A. J. J., Mangleld).—This very fine Pea senally produces well-filled pods, and its failure in this respect in your case we attribute to excessive wet in conjunction with very rich soil. We have pods both of this variety and Telephone before us now that are so full of large peas that it is no easy matter to shell them.

STEPHANOTIS NOT FLOWERING (E. H. Douson).—If you have the freeflowering variety your plant will flower whether it is grown in a pot or planted out, provided the growths are trained near the glass where they can have plenty of light and become well matured, and not crowded round a trailis or grewn in a shaded position. If you wish the plant to cover a considerable space plant it out, but if the space to be covered is limited it will be well to grow the plant in a pot. The shy-flowering variety has very large leaves and grows inxuriantly, the other has smaller fuliage. If a plant is in a pot and the growths are trained near the glass they can be taken down when the flower buds are visible and trained round a trailis for forming a specimen plant.

BRINGWING VIEW BORDERS (W. Field).—Vine borders may be renewed at any time after the crops are cut, but if the weather is hot and the foliage still green great care is requisite in performing the work. A safe time for lifting Vines is as soon as the foliage changes in the attuum and before it falls from the Vines. The soil has not then parted with the heat absorbed in summer and fresh roots often form immediately, specially if the foliage is retained on the Vines. You may either lift the roots entirely or remove all the seil you can from amongst them and work in fresh compost. Your practice in this respect must depend on the state of the Vines and borders, and other circumstances. The narrow border to which you refer should be made twice the width at once, removing as much of the old border as you can without injuring the roots befere you apply the fresh compost. Read the remarks on lifting Vines in our last week's number, they will probably affeed you information that will be of use to you.

SELECT HYADISTRIS (W. E. Olser).—White— La Grandesse, La Franchies, Mont Blanc, and L'Innoesnee. Rede—Vuurbaak, Albert Victor, Von Schiller, and Garibaldi. Bisse—Casar Peter, Princess Mary of Cambridge, King of the Blues, Charles Dickens, and Masterpiece. Tellows—Obelisque, and Bird of Paradise. The above varieties will succeed in either pots or glasses. The most expensive Hyacinths do not invariably produce the largest spikes, neither do those that produce the largest bulbs. Any of the cheaper varieties will do for beds or berdess. Choose the colours you require.

NAMES OF FRUITS (S. M. and A.).—We do not know a Gooseberry named Langley Green. That of which you have sent a specimen is very much like Hebbarn Prohific, a very excellent veriety.

Hobburn Prolific, a very excellent veriety.

NAMER OF PLANTS (S. C. O.).—Plane Lexicle, or one of its varieties.

(H. H. C.).—The small green-foliaged plant is Saxifraga ceratophylla, the other was too creahed for us to recognise it. (F. E. H.).—Stapella picta.

(G. O. S).—The plant is a Sida, but we do not know a species, with which it exactly corresponds. It has some resemblance to S. malvesfora, and perhaps it is a variety of that species. (J. S. Bury).—1, Polystichusus aculestum; 3, Lastres Filiz-mass cristata; 3, We think I. Filiz-formin cristata, but this and the others were too much creahed, the fronds being young, for identifications. Older fronds absolub to sant with spores on them. (J. Heaskew).—Sedum Sieboldi variegatum. (B. B.).—1, Pilea muscoa; 2, Centradenta cross; 3, Minesenda frondosa. (M. B.).—The plant resembles a Spirea, but it was too withered to be autisfactorily idensified. (W. Meds).—The specimen with large leaves is Jasmanum intifolium. The Fern is Nephrolepis pectinate. The Passion Flower is unable to identify. The small white flower is Expetorium sromasticum. (E. W. Footi).—Aulopias angustiolis. (A. A.).—1, Pittonia (Gymnostachyum) Verschaffeltii; 2, F. argyreneura; 3, It is impossible to name such a specimen; 4, Chrysanthenum coronarium var.

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

THE ADVANTAGES OF DEEP CULTIVATION.

The history and traditions of agriculture from the earliest period have recognised the benefit to be derived from deep cultivation; it is still admitted to be a matter of the highest agricultural importance, except in a few isolated cases and under peculiar circumstances of seil and climate. We shall therefore allude to these exceptions whilst carrying out the task we have undertaken of setting forth the advantage to be derived from deep cultivation, and explaining the best and most economical manner of obtaining it.

If we go back to the early period of agriculture in England we shall find that the contest lay between the spade and the plough, and between the labour of man and the power of the animals used in agriculture. Our connection with practical agriculture commenced some years before the power of steam became available for the tillage of the land, and we recollect the proposals of certain advocates who placed the matter before the farmer as spade versus plough. The origin of the controversy upon the subject was the difference in the extent of the occupation, and it is at present a question for the home farmer to consider whether in the cultivation of good land and manual labour at command it may not be judicious to adopt spade culture. If, however, circumstances may be against it as a system for annual usage, there can be no question that land being deeply dug with the spade once every four years would be attended with great benefit to the crops, and also with economy, by facilitating and rendering the horse labour more easy. In cases where spade labour only is in use, such as market gardens, they are dug 12 inches in depth. The evidence derived from experiments where land has been dug with the spade, in some instances side by side with ploughed land, the

result in crops of all kinds, whether of grain, pulse, or vegetables, has been found largely in favour of the former. The next comparison we must make will apply to a home farm where the chief portion of the farm is in pasture with only a limited area of cultivated land; and, in case the labour can be obtained, spade culture, where deep cultivation is a necessity, will be found far more advantageous than the plough culture. Whether the cereal portion of the crops or roots are most required, it must be remembered that not only the greatest weight of roots per acre will be obtained, but in the cereals the amount of straw grown will be most abundant; and this last is an important point where only a few acres are grown, more especially in connection with an extensive area of grass land. This leads us to another point connected with the subject, for at present, although hand labour is more expensive than it used to be, yet the same argument applies to animal or horse power, for the animals themselves cost more than formerly, and so do harness, shoeing, &c. When it is considered that in spade outbure the whole requirements relating to tillage are simply the spade or the steel fork, the rake, and a wheelbarrow, &c., this is a small matter when it is compared with the various implements required for tillage by horse labour, and also the feeding of the horse, its first cost, its annual decay, and the various accidents to which it is exposed. There are also other matters to be looked to, such as hindrance by bad weather, &c.,; these, although only collateral, are nearly all in favour of the spade. We give, however, no money comparisons because the price of labour and other items vary in different districts.

We will now refer to deep culture as connected with farms of considerable size and large areas of arable land; in fact, this is a large subject, requiring great experience to decide the many and various points which will arise for consideration upon the practical carrying-out of deep tillage of the land. We have noticed many instances where ditches have been filled in that the corn or roots always grow with great luxuriance in such cases. The home farmer will have also frequently seen the same results, and this will always be the means of calling attention to the advantage of deep culture. The first kind of soil we will refer to is clay or strong loam, and if such land is too wet and requires draining—which is often the case, particularly where it lies flat and level—draining should always be effected before deepening the tillage, because if the land is stirred deeply before draining, it only deepens the basin and enables the land to hold more water without providing for its escape, which makes it more unfavourable for the growth of crops. In soils with a porous substratum it is, however, just the reverse, for it often happens, particularly where the subsoil is composed of gravel, that there is just beneath the level where the plough has been accustomed to work a hard iron-bound conglomerate of gravel quite impervious to water, rendering the land too wet in the winter and too dry in the summer. When this is broken through by subsoiling, the water can sink down freely, at the same time capillary attraction occurs, giving full assistance to plant life during the summer months. It is, perhaps, difficult to say how deep the land may be stirred with advantage; one thing, at any rate, is certain—that whenever the subsoil varies much it is desirable to render the land as much alike as possible in its productive capacity by deepening the soil throughout, in order that the patches of shallow land with impervious substrats may be made as pervious to the roots of plants as the best land so formed by Nature. An erroneous i

There is one thing we have often noticed. When we have been looking over land in various districts, and when we desired to see what the land was capable of, we have invariably examined the cottagers' gardens, and we hold that whenever cottage gardens are productive the adjoining lands may be made so likewise. Nor is this a question of manure, for the farmer often has an almost inexhaustible supply, whereas the labourer depends chiefly upon the depth of tillage; in many cases moving the land two spits deep, still keeping the best soil on the top. In fact, taking the mode of cultivation generally, the home farmer should remember that the utmost limit of production is not to be obtained by manure alone, but by a well-regulated system of liberal manuring accompanied by deep and effective tillage of the land. Again, whenever it is proposed to cultivate deeper than usual the work should be commenced by deep ploughing or digging during the early winter

months when fallowing for root crops, &c. The newly-broken soil then becomes mellowed by the winter frost and alternations of the weather, and is then in a fit state to become mixed with the other portions of the furrow slice in the after-ploughings during the spring and summer months. We know that it is frequently said when land is more deeply cultivated that more manure is required; but that is not the usual effect, because it is well known that a given quantity of manure will produce far better results combined with deep cultivation. On soils which may have been chalked formerly, and the chalk having, as a considerable portion usually does, sunk into the subsoil, this by deep cultivation is exposed to the action of the atmosphere and brought into use, instead of lying inert in the unmoved substratum. Again, it is often supposed that manure should not be buried too deeply in the soil, as the roots of corn cannot have the full benefit of it; but this is a great fallacy, as the depths which we have stated that the roots both of corn and vegetables descend into the subsoil will prove. With regard to the means of effecting deep cultivation to be obtained by the home farmer, it will depend much upon the extent of the arable land. Upon small occupations it is open only to the use of such implements as were formerly used—namely, the subsoil plough, intended to stir the subsoil alone. This implement usually follows the ordinary plough, and breaks up the pan or hard subsoil without bringing it to the surface, but it is laborious work for three horses, the top furrow having been turned with two horses. This work is, however, expensive, and upon occupations of considerable extent steam power should always be used in a way to be explained in our next article.

(To be continued.)
WORK ON THE HOME FARM.

Horse Labour.—The horses have lately, since the improvement in the weather, been employed in drilling turnips, and this work will no doubt be continued wine only a short root lain has been provided for. Late as it is turnips may yet be drilled after rye, winter oats, or the early white oats with a fair prospect of obtaining a useful crop, particularly if the Grey Stone or Early Six Weeks are drilled with a liberal application of superphosphate and ashes. Although the roots would most likely be rather small, yet, if the seed is drilled at 14 inches between the rows and the plants left thick in the rows, a fair crop may be obtained, more especially if the autumn and early winter months should prove open and mild. When the turnip seed is drilled after a cereal crop as fast as the corn is cut, by ploughing, &c., between the rows of shocks or pooks the land is always moist, soft, and kind, and in much better condition than it often is after a fallow in a summer like the past, and also much freer from the insect enemies to the young plants. In the early districts the harvest will commence by reaping wheat in a few days—in fact, it may be said to have already commenced in a few cases of Talavera, Australian, and the early varieties of wheat sown early. It will this year be extremely important to sow trifolium as early as possible after the corn is cleared, in consequence of slugs being so numerous, for we have never seen them more abundant than they have been during the past summer, and quantities of young mangold plants as well as other roots have been entirely destroyed. A friend asked our opinion upon the policy of sowing trifolium upon a clean fallow instead of after a corn crop, where so many slugs were sure to prevail after harvest; and further asked the best method of sowing, &c., upon fallow land. In reply we stated that there would certainly be a better chance of avoiding the slug, the only enemy of any consequence, by sowing upon a fallow preparation, provided that at least 25 ths. of seed per acre be sown,

but with regularity.

Hand Labour. — Hand-hoeing and horse-hoeing must be continued every fine day, as the weeds have not died after the hoeing as they do in ordinary seasons. We will suppose that by this time all the work of the farm has been forwarded in anticpation of the harvest, so that there may be no delay when it has been commenced. This is more especially necessary in this the latest harvest we have ever known, and anyhow it must prove an expensive one, because the length of the day is fast diminishing and the hours for work decreasing. It often happens when the harvest is unusually late that the corn is not ready for stacking so early in the morning, nor can the work be continued so late in the evening as when the harvest happens a month earlier. September and October are difficult months in which to provide a sufficiency of green fodder for dairy cows and cattle fattening under cover in the boxes; clover, however, may still be available for cutting and soiling cattle and working horses, and where the folium, or vetches with rape, had been sown in May and Jme these crops will now prove extremely valuable. One of our tenants showed us the other day a capital piece of white Canadian oats nearly fit to cut with a fine plant of broad clover at the bottom, and we advised him to cut the oats above the clover, in order that the latter may spring up and furnish a crop fit for soiling cattle soon after harvest, it being good food until the first

frosts commence. In this way for a long series of years we have provided for cattle and horses in the autumn whenever the season has been favourable. The mangold of the previous year's growth will in most cases have been used up by the first week in November; the new crop will then be fit for feeding, for we never hesitate to use mangold at any period of the year, but we always feed with moderate quantities. We have found in our own practice ever since this root first came into use that they are as safe as any other root food for both cattle and sheep at any period with proper quantities of hay or corn, and if used with judgment and discretion.

JUDGING AT POULTRY SHOWS.

It is not long since there was a general outery among fanciers about the paucity of poultry judges. It was supposed that there were few if any fanciers, besides the very few who then officiated at the great shows, who were competent to judge anything like a fair exhibition. Some half dozen judges, several of whom had had constant practice in their duties for over twenty years, had justly acquired great celebrity. The committee of one show followed the lead of another, and thought it absolutely necessary to secure the services of one of these gentlemen. Committees, too, were very exigent, and having got hold of them thought that no amount of work could be too great for them, so quick were their eyes and rapid their decisions. This was extremely unfair upon them. We have seen judges at the end of a long and laborious day poring anxiously into dark pens while assistants held faring tallow candles, or allotting prizes to birds of delicate colours by the dim gaslight of Bingley Hall. The natural result was that they were terribly overdone, and that very frequently their awards by no means gave the general satisfaction that they formerly had given. A thoroughly tired brain cannot possibly make the fine discrimination that one fresh to the work can, neither is the human mind able to be as calm and collected in the beatle of an open or partially open exhibition as in the earlier hours when all is onjet.

hours when all is quiet.

What was to be done to remedy this difficulty? The poultry fancy had outgrown its original dimensions tenfold, and yet all the great shows in the kingdom were being judged by about the same number of men. Many people advocated trying "amateur" judges. The term is a little vague, for all 'the famous judges were amateurs of poultry. Most of them had formerly been successful both as breeders and exhibitors, and had retired from the pursuit content with their laurels of old and their experience. What, then was meant by amateur judges was judges who still amused themselves with breeding and exhibiting. In another point, too, there would be some difference between the two classes of judges. Those who gave the amount of time and trouble to the duty that many of the celebrated judges to whom we have alhaded gave, and in some cases still give, very naturally and properly received some honorarium for their services; while judges who are still breeders and exhibitors, and only now and then forego showing to judge, can afford to give their aid gratuitously. To this suggestion there was great opposition from people, who without much practical experience in poultry breeding, had from diligent attendance at shows gained some superficial knowledge, and thought that they might step into the shoes of the great judges and make judging a profitable employment. They were even warning committees of shows that amateurs would inevitably make a mess of judging, lose their heads, and give all the prizes to the worst birds. Managers of shows, in the apprehension of losing entries, were naturally timid about making innovations. At last one or two tried the experiment. If our memory does not deceive us the Committee of the Cirencester Show were about the first to do so. It was soon found that exhibitors to whom it certainly signified most showed their approval by making large entries at shows so judged, and expressed themselves generally pleased with the result. Of course here and there amateurs make mistakes, lik

We have before us the schedule of the Hemel Hempstead Show, at which we see that not less than six judges will adjudicate in the poultry classes alone; two of these gentlemen have long been on the list of judges, three others have only of late officiated, while one well-known and successful breeder will make his debat, taking some of the local Hertfordshire classes. We also understand that at the shows to be held at the Agricultural Hall in connection with the dairy shows many of the classes will be taken by amateurs specially conversant with them. We always advocated judging by amateurs, and so are extremely glad to eve

this result. Of course it entails some practical difficulties which must be looked in the face. The chief of these arises from the fact that almost all breeders sell their superfluous stock, the breeding of birds of high pedigree would otherwise be too expensive a hobby for any but millionaires, consequently when making their awards they may come upon birds which they have bred and sold; this is certainly a difficulty, but one, we think, which sounds more formidable than it really is. Of course an honourable person (and from such alone are judges likely to be selected) will take care, when engaged to officiate as judge, to part with no birds without a stipulation that they shall not be brought before him. Again, if birds really come into close competition for prizes which he recognises as having ever been in his possession he will at once call in the aid of a brother judge.

The task is a hard one, far harder to delicate constitutions than

The task is a hard one, far harder to delicate constitutions than the inexperienced would believe. Constant and strained attention is necessary in class after class for perhaps many hours, while the judge passes backwards and forwards, to the best of his power carrying in his eye the respective forms and merits of close competitors, and all the while tramps many a mile up and down the show hall. We can testify that one amateur, who probably has during the last two years officiated oftener than any others, is almost always thoroughly knocked up by judging, save only when the public are bond fide excluded till all awards are made. We say bond fide, for somehow or other the clauses in schedules about the exclusion of the public are seldom rigorously carried out. Some committeeman has a friend who must leave the town by an early train, or the reporter of an influential newspaper must be propitiated, or some distant exhibitor has come from far to see the show, has made many entries, and promises more next year if admitted early. For these and divers other reasons a certain number of people generally get in, and of this judges most justly complain. An admirable plan was honestly carried out at the Jersey Show last winter; at a certain hour the show room was locked up with only the Judge in it, and one person to carry his slips as ready to the office; not even the Secretary or Committee entered the room, and we know that the Judge found his labours through some large and super-excellent classes greatly lightened by this easy expedient.

Few things are done to perfection at once. The amateurs who are public spirited enough to officiate as judges may not always in their earlier attempts manage their time well; perhaps at first they find it hard to please themselves, and then horrified at their delay have to hurry on against the grain, but practice overcomes this difficulty. It is best to attempt judging first where competition is not likely to be very severe, and in classes with which the judge is specially conversant. As a rule no man is a really good critic of any breed which he has not kept himself, but when any one with what we have before called a fanciers' instinct has once thoroughly mastered the points of several varieties, he will not find it difficult to become a judge of kinds which he has not himself cultivated. A number of amateurs have been found who are willing to take their turn in foregoing the amusement of showing to judge. We rejoice at this change in the poultry fancy, and augur from it more comfort and self-satisfaction to judges in general, and fewer disappointments to reasonable exhibitors.—C.

VARIETIES.

THE Shropshire Bee-keepers' Association held its Show at Shrewsbury in connection with the Floral and Horticultural Society, on the 20th and 21st inst., but the same cause that has damped so many enterprises this summer told there with terrible effect, the rain descending most pitilessly during almost the whole time of the Exhibition. The Hon. and Rev. C. Feilding, the Hon. Sec., spared no pains in securing entries and obtaining bees for manipulation in the tent borrowed of the parent association, but the weather prevented an admirable programme from being carried out; Mr. Cheshire as lecturer, and Mr. Abbott as manipulator, scarcely getting one hour each day for operations. While cottagers with skeps in the district find their bees in most cases starving, and often also queenless, it is worthy of remark that Mr. Harding, a local bee-keeper with frame hives, brought some splendid extracted honey, several pounds' worth of which were sold. Mr. Abbott obtained first prize for hive, while a cottager entered the prize list with a good bar-framer of his own making, the basis of which was a lobster box, and the total cost to himself less than 2s.

The fourth Exhibition of the Devon and Exeter Beekeepers' Association was held in connection with the Flower Show. The exhibition of bees and bee appliances was, considering this exceptionally poor season, of a satisfactory character. Numerous exhibitors sent hives and other bee appliances from long distances, some coming from Scotland. During the afternoos short addresses on bees and their mode of living were delivered by Mr. S. Baldwin. Mr. S. Griffin officiated as Secretary of the Show, and Messrs. P. Williams, G. Fox, and S. B. Fox as Judges. Mr. Griffin was awarded the chief prizes for the best harvests of honey in the comb, for the best sample of beeswax, for the best supers of honey, for the best observatory hive, and for

the best straw hive. Mr. Steel secured the chief prizes for the best bar-frame hive and the best wood or straw hive. Corvar and Measrs. Neighbour were granted the prizes for honey extractors, Mr. Baldwin for the best single super and apiarian appliances, and Miss Symons for the best display of bee flors.

DO BEES HEAR?

SIR JOHN LUBBOCK, whom we all honour much, tells us that he was utterly unable to gain any evidence of bees hearing. All varieties of sound at his command were alike disregarded. Tuning forks, whistles, violins, and even the voice of the distinguished investigator, which has so often caused the faces of his fellows to beam with delight, produced no response in Master or rather Miss Apis, and hence many have boldly asserted that the bee cannot hear. Let me give some observations which I think rather Miss Apis, and hence many have boldly asserted that the bee cannot hear. Let me give some observations which, I think, prove conclusively the opposite. In the first place, that the bee does not respond to the sounds enumerated, proves nothing; for could some alien being watch humanity as found in our streets during a thunder storm, would he not conclude that the thunder was by us inaudible? Clap might follow clap, and yet each would go on his way simply because the thunder called for no responsive movement; but let a little child with thin and tiny voice but shriek for help, and all would at once be awakened to sympathy shrick for help, and all would at once be awakened to sympathy. So with the bee; sounds appealing to its instincts meet with immediate response, while others with which it has nothing to do evoke no wasted emotion.

The practical bee-keeper if observant must again and again in the ordinary management of the apiary meet phenomena which he can in no way so fully account for as upon the supposition that bees hear, and these in their accumulation present a sum of

evidence which to my mind is perfectly irrefragable.

The adherents of the frame hive are in the habit of taking their swarms in skeps, from which the bees are thrown in front of the swarms in skeps, from which the bees are thrown in front of the domiciles they are permanently to occupy. If the bees are all or nearly all dislodged all goes on well, but if many remain the buzz they set up in the skep distracts and much hinders the inmarch of those ejected. I have many times made the experiment of removing the remaining bees to a distance, and of again bringing them near, when the behaviour of the swarm proper has been such as to force to the conviction that either hearing or small is acting powerfully in guiding the movements of the little throng. In like manner in the making-up of nuclei by dividing a lot of bees having several newly hatched queens amongst them so that a queen is given to each—if the nuclei are placed around the mass lying on a sheet for instance, the buzzing set up in several points at once will so confuse the general body that its bees will remain most vexatiously inert, and will suffer them-selves to be shovelled in any direction and placed close to a nucleus door without caring apparently to enter. If, however, the nuclei are placed close together a direction will be at once taken by the bees generally, and that will be towards their fellows. This fact comes under the observation of those only who raise queens in nuclei, but more would have observed that artificial swarms cannot well be made simultaneously in spots very near to each other, the bees being confused from the same cause as before; and further, if, while an artificial swarm or a natural swarm thrown down, is in full march into a hive another swarm or a stock set buzzing by smoke be brought near, the confusion is at once marked, the march is interrupted, the bees hesitate, and many turn at once towards the alien but bussing bees. The removal of the bewildering sound restores all to order. But here, as before hinted, it may be objected, it is seent and not sound that causes the difficulty; but this can be easily disproved—thus, if the bees intended to cause the distraction be placed quietly near no effect is produced, but so soon as they are shaken or smoked what has been described is observed at once.

or smoked what has been described is observed at once.

In the bee tent at Birmingham a beautiful and accidental confirmation of this occurred. The operator had driven and transferred five or six stocks, and a collection of lost bees, nearly a pint in quantity, had clustered on the canvas lying against the central pole. The dusk of evening was coming on, and they had evidently huddled together for mutual warmth during approaching night. The operator for the last manipulation brought in a stock is the property of the last manipulation brought in a stock. ingit. The operator for the last manipulation brought in a stock in straw, inverted as usual, placed his cloth over it, and waited for my direction to begin drumming. I watched the bees as I spoke; all continued perfectly quiet. The receiving skep was put in position and leant against the upright pole about 2 feet 6 inches above the aforesaid cluster. The drumming commenced. The swarm rose well in from one to two minutes, commencing the well known rush with a strong rustling roar, the bees on the the well known rush with a strong rustling roar, the bees on the canvas so still hitherto faced upwards immediately, and trooped up at once regularly and unhesitatingly, and settled upon the outside of the roof of the receiving skep which the driven swarm was now occupying. I pointed this out to the spectators as an undoubted case of bees directed by the sense of hearing.

Do not these observations explain the often noticed fact that

the swarming of one hive is likely to produce swarming in others? The bees, I take it, hear the sound to which they are responsive and obey it. It also explains to me that from which I have

often suffered, that nuclei, notwithstanding their few bees, are much more likely than strong stocks to swarm out when other hives near swarm. In strong stocks the hum of the busy throng drowns somewhat the sound of the issuing swarm, but in nuclei so little is going on within that it enters with undivided disso little is going on within that it enters with undivided distinctness, and produces its result in giving the swarming impulse. So great is this tendency in nuclei that I have abandoned keeping them amongst other colonies. The pan and key has called forth some good-humoured but possibly not always philosophical banter, for I coafies I think it likely that it has its value. Piping, whatever be its cause, seems to point to a sense of hearing, for it appears to be a sound made for its own value and not the result of some necessary movement; but leaving this question of piping for the present out of view, has not a case of much strength been made out in favour of bees hearing?—F. Cheshiel, Accesse House, Acton.

OUR LETTER BOX.

CHICKENS UMABLE TO WALK (J. Shearer).—They are paralyzed. They have been probably forced into growth by being fed too stimulatingly. Give only soft food.

GRUBS IN HIVE (C. E. T.).—The white grubs you see indicate starvation. Great mischief has been done already, and feeding is the only way of averting total ruin to the stock. The been, finding food failing, are, to reduce their present expenditure and prevent the raising of young which they could not sustain, sucking the jujoes of the larvee and throwing their bodies cut of the blue.

out of the hive.

FOUL BROOD IN SUPER (Garoles).—The super comb in which your queen had bred, and which you feared was tainted with foul brood, arrived so soaked in bleeding honey that little could be determined by appearances. The odeur, however, awakened our suspicions, which the microscope unfortunately confirmed, for the brownish matter is full of microscores. (See the article, "Foul Brood," June 36th.) Since the super is thus tainted the hive will probably be in bed condition. If you will let us know at once whether it has moveable combs, giving us information as to the amount of brood, number of bees, &c., stating also whether you have other hive, we will advise you as to your best course; but begin now to feed with salley!—cated syrup as recommended in the article before mentioned.

CAMABURE WEER ICHOGER PREF (Anatour, Gainsbergent) — Camabur

cated syrup as recommended in the article before mentioned.

CARARIES WIFH CLOGEED FRET (Amateur, Gainsborough).—Canaries fed upon the cayenne pepper food are more likely to become clogged in their claws than when the birds are fed upon seed. Want of cleanlines, even upon any diet, will cause Canaries' claws to become clogged. Cayes should be cleaned out at least once a week, the cage bottom freely furnished with clean grit sand, and the birds occasionally supplied with a bath into which they can enter apart from their usual drinking fountain. If you accustom your birds to a bath they will use it if for a time you keep away the driking vessel. Clogged feet prevent the proper circulation of the blood, bring on a cankerous state of the claws, and eventually cripple the birds by portions of the feet wasting away. Upon freeing the feet from the filth us tenderness and great care. Takes each bird in your hand, and with the sid of some water in a basin soften the dirt with your thumb and finger. In cold weather use tepid water, or you will perchance give the birds cold. The tails of the birds may be cleaned in the like manner, but be careful over operating, or you may draw out the tail feathers. operating, or you may draw out the tall feathers.

operating, or you may draw out the tail reathers.

BARBERS JAM (A.M. B.).—The following is a good recipe for making
the jam:—Pick the barberries clean, bake them in an earthen pas, and
when done pass them through a siere with a wooden spoon; add to then
their equal weight of pounded sugar. Mix the whole and put it into put
covered with sifted sugar, the papers dipped in brandy. It is very wholesome, and so also is jam made from the fruit of Mahonia (Brebris) aquifolia, the jam of this species being considered good for sore throats.

From observations taken near London during forty-three years, the average day temperature of the week is 70.0; and its night emperature 47.1°.

GLOBE ARTICHOKES FROM SEED.

Y remarks on this subject are suggested by the requirements of Mr. J. Cuthbert (p. 158), and they may possibly be useful to other readers of the Journal of Horticulture who may be similarly placed as regards the total destruction by frost of their stock of Globe Artichokes.

Artichokes are undoubtedly very easily raised from seed, and, what is more, the plants if raised early will produce their heads the same season. The question is whether they will be good for any-

thing after they are grown. My experience with seedlings (the season of 1877 excepted) has been very unfortunate, as out of a great number presumably of either purple or green Globe 90 per cent. have been worthless, the heads partaking more of the Cardoon than the Artichoke. Scarcely two plants were alike either in growth or the heads, and in all probability were the result of a cross between the Cardoon and Artichoke, as both are species of the genus Cynara. The seed I believe of both is imported, and must be grown in a very careless manner, which is much to be regretted; as when Artichoke seed is good, which was the case in 1877, the produce is decidedly better than that of plants grown from suckers in the ordinary way; at least such is my experience.

My advice to cultivators is not to rely exclusively on seedlings, but rather to obtain a few suckers from either a neighbouring gardener or a nurseryman. Our plants were nearly all cut down by the frost during the late winter, but many of them pushed up a number of suckers in the spring, which were either thinned out to two or three or were taken up, divided, and planted thinly in lines or dotted singly in various out-of-the-way spots, among fruit trees, &c. Those left on the old stools are now bearing freely, and a succession will be kept up by many of the planted suckers. Any of the latter that do not throw up this autumn will be replanted with a few strong suckers, choosing a warm spot, and from these we expect to obtain our earliest supply of heads next year. We sometimes cut heads at the end of May or early in June; this season the first were cut July 7th. Artichokes are greatly appreciated here (not classed with Cabbages and other second-rate vegetables, as some judges are disposed to rate them), and as we find young plants produce the best heads we are constantly replanting. The present moist season has been very favourable to the production of good heads, and the scales have been more fleshy or thicker than usual.

To return to the seedlings. Where the stock is completely lost by all means sow seed this autumn. The advice on page 158 about retaining some of the plants in pots is very good, as there is every prospect of the coming winter being a trying one. This advice is equally applicable in the case of suckers, but I should prefer planting and wintering them in a cold frame, protecting them only during severe weather. Potted plants, I know from experience, become very "spindly" and the reverse of what is required for the NO. 862-VOL. XXXVIL, NEW SERIES.

in all probability would produce heads early the following summer, and if more seed is sown again in heat in spring, and again in the open ground later on, the supply will be kept up till late in the season. I have never sown any seeds in autumn, but intend trying the experiment this season. My practice has been to sow early in March thinly in pans, using light soil and placing on a moderate hotbed. The seeds vegetate quickly, and the seedlings are soon large enough to prick out in large boxes. I have used pots, but give the preference to boxes similar to those used for growing-on bedding plants. The Artichokes are kept in heat as near the glass as possible till well established, then gradually hardened off, and finally planted out about the first week in May. If I wanted them early I should commence operations in January and plant out early in April. They will do well in almost any position the cultivator may select; all that is necessary is to bear in mind when the produce is wanted, and to sow and plant accordingly. To be more explicit, I should, if I had no other plants to rely on, put some of the strongest on a south border and others to follow these in a somewhat cooler spot; the soil in each instance to be heavily manured and deeply dug, as they are gross feeders and cannot well be treated too liberally. To keep up a further succession I should sow seed early in April in well-manured trenches, the soil of which after the preparation would be slightly below the level, covering the seed lightly, and watering with a rosed pot during dry weather. The seedlings eventually thinned to about 2 feet apart should be kept watered and well mulched before there is danger of breaking the leaves, which are somewhat brittle: an occasional dose of liquid manure is very beneficial. If the seed is true the produce of this sowing will be the best, and will keep up a supply till late in the season. I find the heads of the best seedlings are more conical than are those from suckers; but none of the varieties, however good the first season, prove superior to the old green Globe, and are certainly less hardy, all the best we had succumbed last winter. Suckers planted in a similar manner as advised for the seedlings well repay the extra trouble taken, and, as before stated, are more certain to give satisfaction, in consequence of the many worthless varieties obtained from one packet of seed. The purple Globe proved much the hardier here, but the green variety is preferred at the table .-W. IGGULDEN.

BULBS FOR FORCING.

THE season has arrived when the potting of the bulbs required for early flowering must have attention. Roman Hyacinths if not already in a position to till their pots with roots should be potted without a moment's unnecessary delay. Smaller than 6-inch pots should not be employed for producing a great amount of bloom and vigorous spikes, planting six bulbs in each pot. The stock of Paper White Narcissus should have been in pots before this time. They do well in from 4-inch pots upwards. The pots require to be placed in saucers kept full of water when the plants are in full growth. Tulips, of which only the red and yellow early production of fine heads. Strong autumn-sown plants | Duc Van Thol are forced early in our case, do well in 5-inch

NO. 1014. VOL. LAM, vid Spries.

pots, provided attention is paid to keeping the plants covered until just before the flowers reach the opening stage of development, and not employing overmuch heat to hurry them on. These, as well as other early-forced bulbs, come on very quickly when covered with dry straw, the foliage and flowers being well developed under this treatment. To follow those the crimson Duc Van Thol, Cottage Maid, Keysers Kroon, and Canary Bird are easily forced, and provided they are grown in a rich compost and well fed when growing, five bulbs may be grown in pots the same number of inches in diameter.

A few of the best and most easily forced Hyacinths are Homerus, Norma, Charles Dickens, and Crown Princess; they are in colour red, blush-blue, and white. Those varieties are quite sufficient to grow for producing the earliest flowers. We pot them one or two in a 5-inch pot, according to strength of bulbs. These are also brought on under straw until near the opening of the flowers. To follow these the number of varieties may be extended; in fact Charles Dickens is the only one of the above-named worth growing later than January. A cheap selection of good Hyacinths for ordinary decorative purposes may be composed of the following:—Charles Dickens, Grand Lilas, Marie, Mimosa, King of the Blues, Haydn, Grandeur à Merveille, Grand Vainqueur, Mont Blanc, Gigantea, Von Schiller, Macaulay, Fabiola, Koh-i-noor, Lord Wellington (double), and Ida. For decorative purposes many of these do well grown from three to six in a pot: Charles Dickens, Lord Wellington, Grandeur à Merveille, and Von Schiller are particularly well adapted for growing thus. A 6-inch pot for the triples, and one of 7 or 8 inches for half dozens, are suitable sizes.

Good decorative Tulips, in addition to those already named, are Chrysolora, Proserpine, Superintendent, Van der Neer, White Pottebakker, and Rex Rubrorum. These are grown three bulbs in a 5-inch and four to six bulbs in a 6-inch pot. Of Polyanthus Narcissus we only grow four varieties—Paper White and Gloriosa for early in the season, Soleil d'Or and Grand Monarque for the later batches. These do better with larger pots than are used for either Tulips or Hyacinths. Two large bulbs of Grand Monarque require a 7-inch pot to do them instice.

Of what may be called miscellaneous bulbs Scilla siberica should be extensively grown. A line of this behind Isolepis gracilis as a front row produces a pretty effect. The Scilla should be grown in 6-inch pots, eight bulbs in a pot. It does not succeed with rapid forcing. Triteleia uniflora grown thickly in 6-inch pots is remarkably effective for decorative purposes. It has a serious drawback in the oniony fragrance it emits when too fondly handled. Narcissus Bulbocodium is an exquisite pot plant, and stands remarkably well in rooms. Of the Irises there is perhaps none prettier nor earlier than I. stylosa, followed by I. reticulata.

Although all this class of plants will succeed in almost any kind of soil fitted to sustain plant life, one of the best suited to their requirements may be composed of loam with a very liberal admixture of dry cow or horse manure and sand; and sifted coal ashes form the best drainage for the pots. The soil should be rendered moderately firm with the hand, filling the pot only sufficiently to allow the Hyacinths and Tulips to be just peeping out of the soil. Polyanthus Narcissus may be very much higher, and the other bulbs mentioned should be quite covered. A little silver sand placed under and round the bulbs is of advantage. The middle of October is a good time to pot the later batches, allowing them to remain under cover of ashes or cocoa-nut fibre refuse until the middle of January at the latest. When the pots are well filled with roots liquid manure applied in a weak state is very beneficial.—R. P. B.

m not growing Strawberries in Pots.—Although at present I am not growing Strawberries in pots, and though knowing well the danger of intermeddling with those who differ on a given point, I may yet venture to point out a mistake or two in Mr. Bardney's note on the above subject on page 143. When rooting runners in 3-inch pots there is no necessity to take them off the plants and place them in frames; that is a practice I have never yet seen. Neither is there any necessity for the rooted runners receiving a check when shifted into their fruiting pots, nor that the small pots should be washed, nor that the plants should in any case be weak and puny. I offer no opinion as to which of the two modes of growing Strawberries for forcing is best. I do not imagine with equally good treatment there would be any difference in the results, though

doubtless that advocated by Mr. Bardney has the merit of entailing the lesser amount of labour.—R. P. BROTHERSTON.

GLOXINIA CULTURE.

THE ordinary mode of raising Gloxinias from seed is to sow early in spring, and no plan can answer better if the object is to have the plants in flower in late summer and early autumn; but plants raised from autumn-sown seed may be had in flower in May, and are fine during June and July. These plants are valuable for the decoration of the stove, and equally so for the adornment of a warm conservatory. They are also extremely useful for affording cut flowers totally dissimilar from any other flowers of the same period, and are always acceptable.

If Gloxinia seed is sown now and the plants are grown thinly in seed pans they will form corms about the size of small peas before Christmas; and if these plants are gradually dried of the corms will become firm, and will keep sound in the soil if the pots are placed in a stove and the soil is not permitted to get dust-dry. On being introduced to more heat and moisture in the spring these pea-like corms will start into growth freely, and in due time will produce attractive flowering plants. That is the system that nine out of ten gardeners would adopt, on the assumption that the plants being of a bulbous nature need a period of rest, and that their natural resting time is during the winter. Granting that to be true, it may yet be stated with a considerable amount of confidence that the system referred to is not the best to be followed where fine plants and early flowers are wanted as soon as they can be obtained. The plants need rest, it is true, but surely not before they have done anything—not before they have flowered. Onions are bulbous plants, but if they are sown in the autumn they will grow as fast as the temperature will permit throughout the winter, and will flower early in the following season and then rest. It is precisely the same with Gloxinias.

Let seed be sown at once and the seedlings be pricked of as soon as they can be handled. If grown quite close to the glass in a well-heated stove they will soon be large enough for potting in thumb pots. By about Christmas they will have formed corms, and towards the end of Jannary or early in February the plants will be ready for transferring to 4-inch pots. Growth being encouraged the pots will soon be filled with roots, and 5-inch pots will be needed in early April. In these pots the plants may bloom if desired, or they may be grown to a larger size by a further shift. When grown in either 5 or 6-inch pots Gloxinias are extremely useful for various decorative purposes. A shelf in a house in which Cucumbers are being grown is suitable for the plants, and equally suitable is a Pine stove; indeed any light structure having a minimum temperature of 65°-60° will afford them the requisite accommodation.

It is not, perhaps, necessary to enter into lengthened details as to soil and seed-sowing. Briefly it may be said the soil cannot be too light and fine for the seed pans. Sifted leaf soil and peat in equal parts and a liberal admixture of silver sand form an excellent compost. The soil should be thoroughly watered before sowing, and should be kept moist by shading rather than watering until the seedlings appear. The seed need not be covered at all if it is kept quite dark for a time, when it will germinate with certainty, but the moment that occurs light must be, gradually at first and eventually fully, admitted. Soil of the nature indicated will suffice until the plants are ready for 4-inch pots, when the compost may consist of a third of turfy loam, and for a later shift the loam may be increased and a little dried cow dung or much-decayed horse dung may be added with advantage. Free drainage and copious supplies of water are prime essentials of culture; but especial care must at all times be taken that the soil is never made sour by over-watering, or the result will be—failure.

All who have proper accommodation for growing Gloxinias in the manner suggested will, by the exercise of due cultural care, be rewarded with fine flowering plants next June.—A GROWER.

A ROSE SHOW AT ANTWERP.

ANTWERP had been en fête for three weeks, and among the closing events was a Rose Show held on the 24th and 25th ult. It was held under the auspices of the Cercle des Roseiristes, a Society described by the local papers as among the leading horticultural societies of the country. An English rosarian would under any circumstances have made a point of going, but an additional inducement to our doing so had been furnished to us a few

that firm was going to exhibit.

The Exhibition was held in a large room attached to a restaurant, and was well suited to its purpose. It was gaily adorned with Belgian flags. In the centre of the room was a long and wide table, down the middle of which were placed bouquets formed of Roses and called bouquets for weddings, balls and the hand; colossal bouquets, and bouquets remarkable for their form. Prizes were given to the best in each class. The Roses of Van Houtte's firm and those of the leading amateurs occupied one side of the table, the seven large boxes of another horticulturist occupied the other. The Roses at the sides of the room were placed in banks of moss staged against the walls at an angle of 45°. The local papers spoke in high terms of the Exhibition, and an Englishman cannot wish to decry it; but National Rose Shows have made us fastidious, and judging by the standard accepted even in village shows the Exhibition of Antwerp would not lay claim to great excellence. A few points specially noticeable to an Englishman were the number of classes, the arrangement of the Roses, and their value as exhibits. Amateurs exhibited in classes varying from ten Roses to seventy-five, horticulturists from ten to a hundred; and the number of Roses exhibited by the leading firms may be gathered from the fact than Van Houtte took prizes for twelve, twenty-five, fifty, seventy-five, and a hundred; while another horticulturist drew our attention to his twelve hundred Roses staged against the north wall of the room. The Roses were in many cases not exhibited in boxes, but separated by strips of rose-coloured paper pinned to the mossy banks. Many of the Roses were unknown to us even by name, and such a label as "Soffrano du couleur rouge" made one stare. The well-known favourites, Baronne de Rothschild, Capitaine Christy, Etienne Levet, Charles Lefebyre, Marquise de Castellane, and many others were represented, but in a form hardly to be recognised, so wantmg were they in substance, colour, and size. As a rule all the Roses were much overblown, and although we saw them early on the first day of the exhibition they were rapidly failing. The method adopted to keep them for the second day was somewhat startling. Syringing was vigorously applied, and our remonstrance was greeted with a shrug and a good-humoured confession, "Probably they will be spotty."—J. M. FULLER.

AUTUMN PROPAGATING.

In all gardens of considerable extent where bedding plants are required in large numbers propagating in autumn is an operation of great importance, and success in the following spring depends in no small degree upon the efficiency with which it is performed. The flower gardener must now have matured his plans for the ensuing year, mentally at least, and be can then estimate the number of plants that are requisite to the execution of his designs. Some judgment is needed in determining this, for while it is undesirable to have houses and frames crowded with plants considerably in excess of the demand, yet it is well to be on the safe side. In ordinary seasons the present time would be somewhat late for commencing propagating; but the weather we have experienced this year has been extremely unfavourable to such bedding plants as are cultivated chiefly for their flowers, and the consequence is that their beauty will be of sufficiently short duration without being unduly shortened by early cutting. The low temperature at the time of planting out gave a check to the growth of the plants from which it has taken them some time to recover, and now the abundant rain has induced the production of coarse and succulent shoots that are very unsatisfactory to the propagator. This is particularly the case with Pelargoniums, the entire stock of which for the next bedding season is usually propagated in autumn; and when the cuttings are weak, sappy, and long-jointed the difficulties attending their preservation during the winter are considerably increased.

Where the plants employed in decorating the beds are numbered by thousands propagation is more easily, efficiently, and economically effected by having a small house entirely devoted to the purpose, but where smaller numbers are required an ordinary propagating frame will suffice, placed either over hotwater pipes or on a hotbed of manure and leaves. A propagating house may be either span-roofed or a lean-to; if the former it should run from east to west; and if the latter a southerly aspect is the best, so that all the light possible may be obtained. The house should be divided by a glass partition into two compartments, in one of which the propagating is effected, and the other for wintering such plants in that require heat; this division must be provided with a stage so that the plants may be placed near the glass. Both compartments must be efficiently heated so that a stove temperature may be maintained, and

days before by a correspondent at Van Houtte's of Ghent, that | jurious to the class of plants requiring such protection. propagating department pans must be placed over the pipes and kept constantly filled with water, over these place a layer of slates, and then 8 or 9 inches of cocoa-nut fibre or sawdust in which to plunge the pots containing the cuttings, the whole being covered with a frame furnished with lights that can be removed at pleasure. The above remarks only apply to such plants as Iresines, Coleuses, Alternantheras, &c., that require a temperature of 60° to 75°. Lobelias are better wintered in a warm greenhouse, and Pelargoniums in a frame only sufficiently heated to protect them from frost and damp.

Pelargoniums. - All the varieties with variegated foliage may be struck in the open ground; but the season is somewhat late for this now, and they should have the protection of glass. If cuttings be inserted in a bed of moderately light soil, when they are well rooted they should be taken up and potted in small 60's. It may be well to remember, however, that when small 60's. It may be well to remember, nowever, that when Pelargoniums are grown for their foliage alone spring propagation may also be satisfactorily adopted. The green-foliaged varieties are generally wanted in large numbers, while the space for wintering them is limited. In this case firm short-jointed cuttings should be selected and inserted in pots, placing from four to a dozen cuttings in each pot according to the size of the pots employed, this usually being determined by the shelves and stages on which the pots have to be wintered, four cuttings according to their size being quite sufficient for one pot. The cuttings may also be inserted in boxes of various sizes. The soil must consist of rich loam and a proportion of sand to render it porous. The pots may then be placed on a firm bottom of ashes in a span-roofed frame; give the cuttings a thorough watering, and maintain a moderately warm temperature until they are rooted, when air must be given freely on every favourable occasion, and watering carefully attended to on fine bright days. Sturdy little plants will be the result, and in early spring these must be potted singly and gradually hardened off.

Calceolarias.—The varieties of Calceolarias commonly grown in our gardens are easily increased by cuttings inserted in sandy soil either in pots or beds provided a cool position is assigned to them during the winter, only affording some protection from severe frosts. But the preferable method is to prepare a bed of decayed leaves, loam, and sand, in which the cuttings should be dibbled, place a low frame over them not more than 1 foot or 18 inches high at the back, and the lights should only remain on in wet or frosty weather, a quantity of loose hay forming an excellent protection in case of severe frost. In the spring the plants may be either potted or carefully removed to the beds they are intended to occupy. The first week in October is a good time for inserting the cuttings.

Lobelias.—It is necessary to raise Lobelias by cuttings as

the varieties do not come true from seed, although the latter method is the quickest and least troublesome. Difficulty is frequently experienced in obtaining cuttings in autumn unless there is a reserve stock, the flower shoots of which have all been cut back to induce early and vigorous growths. If they cannot be obtained in this way the old plants in the beds should be taken up before they are affected by frost, and all the young shoots removed; those at the base of the plant will be the best, and if with a few roots attached so much the better. Prepare a compost of leaf soil and sand, and place it in well-drained shallow pans. Insert the cuttings rather thinly, and plunge the pans in a hotbed under a frame, shading carefully for some days if the weather be bright. When the cuttings are rooted remove the pans to an intermediate house or warm greenhouse, where they can be retained near the glass until spring. Then growth must be encouraged by a higher temperature and frequent syringing, occasionally damping the pipes with liquid manure to promote the evaporation of ammonia, which we have found to stimulate growth considerably, and abundance of cuttings will be easily secured.

Alternantheras.—These and the two following are more successfully propagated in a house such as that previously described, but any position where a stove temperature is maintained will suit them provided a good supply of moisture is kept up in the atmosphere. We have found that autumn-struck cuttings yield a larger supply in the spring than old plants, and the latter very frequently die off in the winter. The cuttings should be inserted thinly in a compost of sand, loam, and leaf soil, 48-size pots being the most convenient. When the cuttings are struck the pots should be placed on shelves near the glass, and watering must be carefully attended to. Alterglazing should be carefully attended to, as drips are very in- nanthera amona is more difficult to increase and preserve than

A. paronychioides. A. latifolia, or A. magnifica. A compost of peat, loam, and bienty of sand appears to suit it best, and we generally employ 60-sized pots, which are preferable to those

of larger size.

Iresines and Colcuses .- Similar treatment suits both these plants, and indeed they can be readily increased in the same manner as Alternantheras, employing 48-size pots and a compost of loam, sand, and leaf soil, the latter being well sifted for all these plants, and the small pieces of wood removed, as they give rise to the web-like fungus which proves so troublesome. We have found that if river sand can be obtained it proves much better adapted for autumn propagating than silver sand, as it is coarser and preserves the soil in a more open condition. The pretty little white-foliaged Leucophyton Browni, now so popular in carpet bedding, we have treated precisely the same as Alternantheras with success; but Mr. Graham, Superintendent at Hampton Court, has stated in the Journal of Horticulture (page 174, vol. xxxvi.), that the only way in which he could succeed with the plant was by dibbling the cuttings in sandy soil in a cold frame. This is the best plan, as the plants grow more freely when bedded out than those struck in heat.

Few other bedding plants require special propagation in autumn except where Centauroas such as C. ragusina are largely grown, and it is necessary to attend to them as early as possible in the season so as to have them well rooted before winter. We have found them succeed best when inserted singly in sandy loam in 60-size pots. Place the pots in a cool frame and shade for a week or two until the cuttings appear to be producing roots, when water must be very carefully supplied. Mentha Pulegium gibraltarica may be increased ad infinitum by division, wintering it in a cool frame. It need be scarcely suggested that propagating should be no longer deferred, as the days are now shortening, and light is a most important element in securing the chief desire of a propagator, "a good

strike."-L. CASTLE.

THORNTON HEATH HORTICULTURAL EXHIBITION .- AUGUST 27TH.

THE numerous suburban horticultural societies that have been organised in recent years very significantly denote that popular interest in gardening pursuits is fast increasing; the enthusiasm of the gardener is now shared by thousands, who find in the cultivition of plants pleasant recreation and healthful exercise. Many gentlemen amateurs devote a considerable portion of their time to the advancement of horticulture generally, by their own individual efforts, and by uniting to form societies in which the more energetic willingly undertake the active management. The society named above is one of this kind, and although only in the third year of its existence, and situated in a district that is not very densely populated, yet it is thriving, and judging by the vigorous and efficient manner in which it is conducted we augur well for its future prosperity. On the occasion of the present Exhibition the weather proved most unfortunately adverse to success, as rain fell heavily throughout the day, but the Committee must comfort themselves with the reflection that such has also been

the fate of many other similar exhibitions this season.

The shibits were generally good, and comprised plants, cut flowers, fruit, and vegetables, the first and the last of which were the best represented, the display of Potatoes being excellent. In the eighty classes that the schedule enumerated about 150 exhibitors entered, including the cottagers. In the classes devoted to plants the principal prizes were obtained by Mr. J. King, gardener to Stepheneon Charles. Convident Leden. Mr. Parkeld, gard. to Stephenson Clarke, Esq., Croydon Lodge: Mr. Penfold, gardener to Canon Bridges, Beddington; and Mr. Horton, gardener to H. Moser, Esq., Westwood, Beulah Hill, all of whom exhibited fine specimens. Mr. J. King was placed first and second with four stove and greenhouse flowering plants, his collection including some handsome Ving as that it is unjoint to other arbitists as to allow some handsome Vincas: but it is unfair to other exhibitors to allow one to monopolise the prizes in this manner, and there should be a stipulation in the regulations that no exhibitor can take more than one prize in the same class. Mr. Horton was first in the groups; the collection comprising Crotons, Pancratiums, Dracesnas, Fuchsias, &c., gracefully combined and edged with Gloxinias, Panicum variegatum, and variegated Hydrangeas. Mr. J. King followed also with a pretty group, but slightly too formal; Mr. J. Fewell, gardener to J. C. Lanyon, Esq., Croydon, being third with a rather heavy group. Cut flowers were not very numerous nor of high quality. Dahlias were however, good, and Mr. Minchener of Sunny Bank, South Norwood, was placed first with a collection of twelve handsome blooms, large and well formed. Mr. Penfold, who was second in the same class, also sent remarkably even and clean flowers, but rather smaller than the others. The bouquets and table decoration were of only average excellence. Fruit was shown in very small quantity and indifferent condition.

Vegetables were more abundant, and several good collections were contributed by Messrs. Johnson, Hakeman, Welstead, and Gooch, the latter gentleman exhibiting a remarkably fine collection of Potatoes, for which he obtained six prizes. In addition to the Society's awards for vegetables special prizes were offered by the following firms:—Messrs, Sutton & Sons, Reading; James Carter & Co. Helborn: Deniels Beeg. Namick Hard. Carter & Co., Holborn; Daniels Bros., Norwich; Hooper & Co., Covent Garden; and Dick Radclyffe & Co., High Holborn. Among the miscellaneous groups one from Messrs. John Laing & Co., Forest Hill, was very attractive, comprising Dracenas, Palms, Phloxes, &c. Messrs. Hooper & Co. sent a collection of ornamental dried Grasses and Everlasting Flowers. Mr. John Cattell of Westerham contributed out Roses, Phloxes, &c.; and Messrs. Dick Radclyffe an artificial rockery and fountain. All the above were highly commended by the Judges.

As on previous occasions the Treasurer, R. T. Oelrichs, Esq., Elm

House, very kindly permitted the Exhibition to be held in a portion of his grounds, which are well adapted for the purpose, being convenient of access. Much of the Society's prosperity is due to the exertions of the indefatigable Honorary Secretaries, Messrs. Atterbury and Gooch, and they are cordially assisted by many members of the Committee, particularly Mr. Hakeman.

AURICULAS 140 YEARS AGO.

I HAVE been favoured by the Messrs. Sutton of Reading with a list, sent to them by Mr. Parsons of Wootton Bassett, of Auriculas grown in 1744. It was found amongst a lot of old papers, and was sent by a lady of Marlborough, Mrs. Sancey. Of course we would hardly expect to find any of the flowers in the list that are grown at present, although many of the show varieties date back a great many years. The gentleman amongst whose papers the list was found grew 150 sorts, and one would give something to know what varieties they were. Were there amongst them any George Lightbody or Smiling Beauty, or were they merely sorts of no value but the forerunners of the race which has culminated in the grand flowers of the present day? Had they any woolly aphis or mealy bug, which I perceive according to a contemporary has appeared in several collections? And one would like to have known something, too, of the individuality of the writer of the list. She must have been an enthusiast, and I daresay loved her Auriculas as much as any modern cultivator. She wrote a hand, too, which displays a good firm character, and I have no doubt she was much in and out amongst her pets, and could give her gardener if he had been careless a good wigging.

The gentleman who furnished the list mourns over the decadence of the taste in the south. Even forty years agothere were, as I know from a list which I have seen, nearly forty or fifty exhibitors of the Auricula where now we have only

six or seven. Subjoined is the list alluded to.

POTATO DISEASE.

I AM sorry to have to report that Potatoes are badly diseased, especially the early varieties: Early Ashleaf, Myatt's Prolific. and Early Rose have suffered severely. It is many years since they were so badly attacked with the disease so early in the season. The crops generally are good as regards quantity and size, but many plots that have not been taken up in time are scarcely worth the trouble of lifting now. I fear the late varieties will also be bad, and I strongly recommend that all late varieties be at once lifted if there is the slightest symptom of disease in the haulm. Never mind if the skins are loose and rub off a little: the tubers will form fresh skins, and will be none the worse for eating purposes a few weeks hence. I advise the lifting of all Potatoes that are considered large enough for table use, even if the tops are as green as Leeks. Great mistakes are often committed after the Potatoes are lifted in storing them away in too large heaps. They should be stored

away thinly in cool open sheds having a north aspect, the tubers being looked over at frequent intervals for the prompt

removal of any that are tainted.

I am afraid that Potatoes will be both scarce and dear in the spring, that is if they are as badly diseased in other counties as they are here (Beds). All who have vacant plots of ground will do well to have a batch of winter Spinach and other useful crops put in as soon as possible, the Cottagers' Kale and Asparagus Kale being useful and hardy. It is not yet too late to plant late Broccoli, the heads of which will be found very useful in the spring.—G. R. A.

THE SEASON AND ROSES.

TAKING all things into consideration Roses perhaps have disappointed us less than most other plants that have experienced the trials of a remarkable winter and yet more remarkable summer. The season of flowering was generally late, with us specially so. Even old-established trees did not come into bloom till quite the end of July or beginning of August, whilst at this date towards the end of the month I am still waiting for some amongst the last autumn-planted Teas and Hybrid

Perpetuals to show their colours.

But Rose blooms on the whole with us were very beautiful and very continuous, notwithstanding the failure amongst the pale Roses, of which so many decayed. As for the dark Roses they were glorious; and several of a class not generally velvety, such as Beauty of Waltham and Madame Charles Crapelet, showed deep and unusually rich shadings. It was impossible to give liquid manure of any kind; but when one or two days of hot dry weather came we applied a surface dressing of stable manure which the quickly returning rains soon washed in, and the results to the Roses were most satisfactory. La Rosière, Duke of Connaught, Sultan of Zanzibar, Jean Liabaud, Prince Camille de Rohan, and Baron de Bonstetten were very rich. Duke of Edinburgh was in grand form, fuller than usual and dazzling in colour. Abbé Bramerel, often rather small in petal, attained an important appearance. Black Prince could not reconcile himself to the wet; the only year he has ever failed

Amongst the very pale Roses Madame Hippolyte Jamain was very perfect, charming by her faultless form and the exquisite transparency of the petals. Of coarser Roses Paul Neyron and Alfred Mouton were most striking in size and effective in colour. Amongst the ladies Madame Charles Wood, Madame Victor Verdier, Madame Marie Rady, Marie Finger, and others which I cannot ask space to name, have been and are still floriferous. On many trees the late deluging rains have damaged the coming blooms, many being quite disfigured, and the buds extensively spotted with mildew. Aphis appear here and there where there has been excessive growth, but of earwigs I do not think I have seen a dozen all the season.—A. M. B.

CHIRK CASTLE TURNIP.

THE last sowings of Turnips are now being made, and the work receives special attention from the importance wisely attached to obtaining a crop of sound medium-sized roots that will stand the winter and continue in good condition late in spring. For the earliest sowing in March and successional crops till the middle of August I prefer Snowball, but for the late sowing there is nothing like Chirk Castle. It is not a large Turnip, and has a black rough skin anything but tempting in appearance, but is nevertheless a veritable rough diamond, the removal of the objectionable skin revealing a root as crisp, succulent, and white as can be desired, and singularly firm in texture, hence probably its hardiness and property of keeping so well. The moderate size to which it grows admits of the plants being left thickly in the bed, a good plan to follow with all late-sown Turnips, the clustering leaves then serving in some measure to screen the roots from frost. The bed of Chirk Castle is always three or four times the size of ordinary sowings, for the obvious reason of the greater and more continuous supply that is required from it at a season of the year when dishes for which this valuable esculent is needed are much in demand.-EDWARD LUCKHURST.

CANDYTUFT FOR POTS.—Where the new hybrid Candytuft has once been grown in gardens and allowed to stand and seed, seedlings will come up freely. It would be well to litt some of these seedlings now, and place them in small pots

allowing them a shady position outside for a few days, then placing them where they can enjoy plenty of light and sunshine. When the plants want more root room they should have 4 or 5-inch pots, which are large enough to flower them in. The flowers vary from pure white, light and dark lilac, to almost purple, &c. These plants if housed at the first appearance of frost will reward the cultivator with a magnificent show, and make the greenhouse attractive and gay for a long time. The flowers are very useful for cutting, and last a long time in a cut state.—SCIENTIA.

CRYSTAL PALACE FRUIT SHOW.

AUGUST 21ST, 22ND, AND 28RD.

OWING to the excessively unfavourable weather for fruit growing this season, and to the fact that the date of the Exhibition was a month earlier than last year, it is not surprising that the exhibits both in quality and numbers were much inferior to previous displays. Grapes were far the most numerous, there being staged in the ten classes devoted to them over forty collections. The white varieties were generally very unripe and small, but many of the black varieties were well finished in colour and bloom although not fully ripe. Peaches were well shown, especially Royal George, some of which were extremely handsome fruits. Nectarines were few but fairly good, and the same remarks apply to Pines and Melons. Apples and Pears were only represented by a few dishes of small and unripe fruits. Of Cherries only a few dishes of Bigarreau and Morellos were exhibited, and Plums were very scarce, but in most cases well ripened. As already notified the projected show of cut flowers was wisely relinquished, for the display would have been of a very insignificant character. The exhibits were arranged on long tables, down the centre of which were grouped Palms and other plants that served to pleasantly relieve the otherwise monotonous and flat appearance of ordinary fruit shows. Several bright groups from the principal nurserymen were contributed, the most noticeable being Messrs. Kelways' collection of Gladioli and Messrs, W. Pauls' cut Roses.

There were only three competitors in the class for a collection of twelve dishes of fruits, and Mr. W. Coleman, Eastnor Castle Ledbury, obtained the premier position with well finished handsome specimens. His Grapes were Black Hamburgh and Muscat of Alexandria, the former of medium size, but both were excellently ripened and bearing a fine quantity of bloom. Royal George Peaches and Pitmaston Orange Nectarines were exhibited in good condition, also a dish of Kirke's Plum. The Melons were Golden Gem superbly ripened, and Dr. Hogg rather inferior. Pines, Charlotte Rotbschild and Prickly Cayenne, even and good. A dish of fair Bigarreau Cherries and one of Brown Turkey Figs completed this beautiful collection. Mr. George Sage. Ashridge Park Gardens, Herts, was placed second with a fair collection, the most noticeable fruits being the Royal George Peaches extremely fine, Elruge Nectarines well ripened. Brown Turkey Figs, and a small bunch of excellent Banauas. The Grapes were of rather inferior quality. The remaining prize was awarded to Mr. David Wilson, gardener to Earl Fortescue, Castle Hill, Sonth Molton, North Devon, in which collection were very fine Gros Colman Grapes and a good Colston Bassett Melon. In the next class there were more competitors, for six collections of eight dishes were staged. Mr. Wn. Allen, gardener to Lord Suffield. Norfolk, obtained first honours with large bunches of Muscat of Alexandria rather imperfectly ripened; Gilbert's Netted Victory of Bath, thoroughly ripe, of medium size, butvery sparely netted; Bigarreau Royleson Cherries, excellent Moorpark Apricots very good, and other fruits of inferior quality. Mr. G. Miles, Wycombe Abbey, Bucks, followed, the Muscat of Alexandria and Morello Cherries, Elvetham Park, Winchfield, was third. The Violette Hative Nectarines in this collection were noticeable for their fine condition.

Grapes, as we have already observed, were abundant but not distinguished by a very high state of perfection, especially Muscat of Alexandria, Buckland Sweetwater, and Foster's White. Maresfield Court, Black Hamburgh, and Gros Colman were better finished, and in some cases unusually good. The principal class was the one for ten distinct varieties two bunches of each, and there Mr. W. Elphinstone, gardener to E. M. Munday, Esq., Shipley Hall, Derby, secured the highest award. The varieties were Golden Queen, fair in size but unripe; Buckland Sweetwater, berries small but ripe; Muscat Hamburgh, well finished; Black Alicante, fair quality; Gros Colman, bunches small but handsomely finished: Muscat of Alexandria, berries small and not ripe; Madresfield Court, of average excellence; Foster's White, partially ripened; Black Hamburgh, small in bunch and berry and rather rough. Mr. Thomas Bannerman, gardener to Lord Bagot, Rugeley, was the only other exhibitor in this class and obtained the second place, but his fruit was very deficient in quality. The varieties were chiefly the same as the last, except the following: White Tokay, Lady Downe's Black Prince, and

Duke of Buccleuch. For a collection of five varieties Mr. Thomas Jones was first with rather poor fruit; Madresfield Court was the best, but even that was far from ripe. Mr. G. T. Miles was second with imperfectly ripened fruits but good varieties. These

were the only two exhibitors.

In each of the remaining classes two prizes only were offered. Mr. W. Coleman was first with three bunches of Black Hamburgh well finished; and Mr. Wm. Nash, Badminton Gardens, Chippenham, was second with small bunches. The competition was strong in this class, for there were twelve exhibitors. Mr. Wm. Coleman was again first with Muscat of Alexandria; bunches large and handsome, berries also good but not ripe. Mr. Walter Johnston, gardener to the Marchioness Camden, Lamberhurst, Kent, the only other exhibitor, was second with inferior bunches. For three bunches of Gros Colman the prizes were awarded to Mr. George Tucker, gardener to J. L. Lovibond, Esq., Farnborough, and Mr. T. Bannerman, the first being very good. There were three exhibitors of Madresfield Court; Messrs. J. Peed & Son, Roupell Park Nurseries, Norwood Road, being first with well-finished froit of moderate, and Mr. C. J. Goldsworthy, Bletchingley, Surrey, second with larger bunches but not well ripened. Mr. H. Folkes, gardener to T. F. Halsey, Esq., M.P., Hemel Hempstead, was first with Black Alicante, very fine and ripe; while of the two remaining exhibitors Mr. W. Nash was awarded the second prize with fruit but little inferior to the first. In the class for three bunches of any other black variety than those provided for specially there were seven exhibitor. Mr. W. Elphinstone obtained the highest award with moderately good bunches of Muscat Hamburgh; and Mr. W. Coleman was second with Venn's Seedling, small but well finished. In the corresponding class for any other white variety Mr. H. Folkes staged fair samples of Buckland Sweetwater and secured the honours; Mr. Frank Jordan, gardener to Birket Foster, Req., Witley, Surrey, being selected from seven exhibitors to receive the second prize for Foster's Seedling, rather small in berry but bunches large. Prizes were offered for the heaviest bunches, and Mr. Frank Jordan obtained the chief award with a bunch of Black Hamburgh weighing 5 fbs. 4 ozs.; and Mr. O. Goldsmith, Poleeden Lacey, Dorkin

Pines were few but good. Mr. G. T. Miles was first with a fair Queen; Mr. D. Wilson secured a similar award for a fine Smooth Cayenne; Mr. G. T. Miles being second with a smaller fruit. In the class for any other variety there were three exhibitors, and Mr. W. Coleman was placed first with a remarkably handsome well ripened fruit of Charlotte Rothschild, Mr. D. Wilson following with a good fruit of the same variety. The latter was the only exhibitor of three dishes of Peaches, and he obtained the first prize with Alexandra Noblesse, Belle Beauce, and Crawford's Barly, all very good. The same exhibitor was first with three dishes of Nectarines—Pitmaston Orange, Early Newington, and Lord Napier, of medium size but ripe. Mr. W. Bannerman followed with a collection very close to the former in quality. There were ten entries for one dish of Peaches, Mr. George Sage obtaining the first chief award with a dish of remarkably handsome Royal George. Mr. W. Goldsmith received the inferior prize for good fruits of Princess of Wales. For a single dish of Nectarines only two competitors appeared. Mr. J. Fry, gardener to T. G. Baker, Esq., Haydon Hill, Essex, obtained the first place with excellent Pine-

apple Nectarines, and Mr. J. Woodbridge followed.

Two classes were devoted to Melons, one for Green-flesh varieties and the other for Scarlet-flesh. In the former Mr. George Sage obtained first prize with a large and ripe Eastnor Castle; Mr. T. Bailey, Shardiloes Gardens, Amersham, being second. Four exhibitors. In the other class Mr. W. Carmichael, Newton Court, Bury St. Edmunds, was first with well netted Victory of Bristol, and Mr. W. Coleman followed with Dr. Hogg, small but ripe. Nine entries. Mr. G. Sage was placed first with three dishes of Figs—Lee's Perpetual, Barnissotte, and Blanche, all ripe and good, the only exhibit. There were four entries in the class for one dish of Figs, and Mr. W. Coleman obtained the honours with a dish of excellent brown Turkey, followed by Mr. G. Sage. Mr. James Fry was first with three dishes of Plums, comprising Emperor, Golden Gage, and Kirke's, all fine; Mr. W. Fanning, The Convent Gardens, Roehampton, being second with fair fruits. Mr. T. Jones with a dish of excellent Green Gages, and Mr. W. Fanning was second. Three entries. Apples and Pears were so small and unripe that they do not merit being noted in detail

that they do not merit being noted in detail.

For a dish of twelve Tomatoes Mr. James Worthing, The Gardens, Chadwell Heath, had a dish of excellent fruits of the variety Trophy. He was placed first, and Mr. Phillips, gardener to Captain Jackson, The Deodars, Meopham, followed with Acme, also good. Five entries. There were seven entries in the class for a brace of White Spine Cucumbers, Mr. John Davey, gardener to Mr. Drew, Streatham, being first, and Mr. John Worthing second with seedlings, both neat and good. For a brace of Black Spine Mr. Phillips was first with Carter's Model, excellent both in form and bloom; and Mr. G. Roach, gardener to D. B. Price, Esq., Honor Oak, Forest Hill, was second with Reliance, good but rather large. Mr. W. Williamson, gardener to C. W. C. Hutton, Esq., Belair, Dulwich, was first with a brace of

smooth Cucumbers; the variety was Telegraph, even in size and good. Mr. W. Roots, gardener to W. F. Hughes, Esq., Elmsleigh House, Sutton, was second with small fruits. There were only three competitors in this class, and in fact Cucumbers were not by any means numerous nor of extreme excellence.

Miscellaneous collections of plants and flowers were exhibited, and extra prizes were most deservedly awarded for them. Messra. Wm. Paul & Son, Waltham Cross, sent twelve boxes of excellent cut Roses; Messra. John Laing & Co., Forest Hill, contributed a large and graceful group of Palma, Dracemas, Phloxes, and Ferns; Messra. Kelway & Son, Langport, had a large collection of Gladiois similar to that exhibited at Kensington on the 26th nlt. First-class certificates were awarded for the following varieties, the three first of which were described on page 170—Duke of Connaught, Duchess of Connaught, Jessica; James Douglas, delicate pink with white and rose streaks, large flower and dense spike; Lord W. Beresford, rosy crimson streaked with white, extremely large flowers and spike. Messra. Hooper & Co., Covent Garden, exhibited a collection of dried Grasses and Everlasting Flowers; and Mr. Thomas Laxton showed a collection of new Peas and extremely large Beans from his Experimental Gardens at Girtford, Bedfordshire.

SILVER-SKINNED VERSUS QUEEN ONION.

THE Queen Onion has been highly spoken of as being a very valuable and quick-growing variety. Having this season grown both the varieties named side by side under exactly the same conditions as to soil, &c., I have found the Silver-skinned the earlier, and it has also produced the better shaped bulbs, assuming that I have the true variety of Queen, which I have no reason to doubt, as the seed was obtained from a trustworthy source. To further test the two varieties I again sowed them side by side. It may not be generally known that the Silver-skinned Onion is a good variety for autumn sowing, as it is very hardy and comes in earlier in the spring than any other that I have grown. So many rival varieties are cropping up year after year that I think we should endeavour to prove the genuineness of the new arrivals before discarding the old and tried sorts.—G. R. Allis.

QUILLED ASTERS.

I know of no flower that will better repay for a little trouble in cultivating than the above, as a fine display of bloom may be easily obtained from the first week in August to nearly the end of November. The seed should be sown about the middle of April in light rich soil, placing the seed pans in a cold frame. When the young plants appear give abundance of air to ensure sturdy growth, and when they have made the rough leaf prick them off, finally planting them out when about 3 inches high. I plant in rows 1 foot between each plant, and 20 inches between the rows. The self colours such as Snowball, Purple Prince, and Princess Alice are at least a fortnight later in blooming than the fancy varieties such as Princess Alexandra, Grand Duchess Marie, or Unique.

When the plants are about 6 inches high I place stakes to them 3 feet high, and apply about a tablespoonful of Amies' manure to each plant, and stir it carefully in with a pronged trowel or light fork, being specially careful of the roots which will be found very near the surface. If kept well tied to the stakes it is astonishing what an amount of rain and wind the plants will endure without serious damage. Asters are very effective in lines with a background of shrubs. A good arrangement would be: First row Purple Prince, second Snowball, third Princess Alice, and for the fourth either Prince of Novelties, Princess Alexandra, or Unique. At the season of flowering I prefer to pick out the centre bud, as the later blooms are generally better formed; but I do not even for exhibition purposes disbud freely, depending for good blooms entirely on rich soil and careful watering. To ensure success maintain a free growth by means of stimulants. Three ounces of guano to two gallons of water will be found to improve the substance of the flowers greatly.—PEDAGOGUE.

LATE KIDNEY BEANS.—Many of our small plant frames, which were filled with Melons and Cucumbers in May last, are now being emptied, and refilled with a little fresh loam and manure in which to plant Dwarf Kidney Beans. These are placed in rows a foot asunder, the seed being 2 inches apart in the rows. Osborn's Forcing is the variety we prefer for this work, as it grows dwarf and bears freely. So long as the weather remains mild the lights will not be placed on the frames, and if all goes well we expect to gather many dishes

from the plants during November, when all Beans in the open have decayed. I can answer for this being a safe and simple mode of securing late Kidney Beans, and all who care for this delicate vegetable and have empty frames at the present time cannot do better than utilise them in the manner indicated .-A KITCHEN GARDENER.

ROSES IN FORFARSHIRE.

CROSSING the Border at the right time has this clear advantage, that you obtain not only grouse, but under favourable circumstances two summers (possibly two winters might be more the expression this year). Strawberries and Roses all over again. Eight hours and a half by the excellent "Flying Scotchman" from King's Cross will land the southerner in Edinburgh, that most picturesque of cities, and then "the world is all before him where to choose," or if he is bound for some hospitable big house so much the better for him. Coming from the south I am always astonished at the gardens of Perthshire. The sweet Rose Mille. Bonnaire, which I never can coax into excellence, is there quite robust. But situation is everything. A friend, who resides not far off on a windy hill, describes Boreas as occasionally tearing Cabbages and Box edging up by the roots, and raising the gravel on the drive into various little heaps.

And then the winter. Last year, in Forfarshire, the keeper one day in October put down 150 rabbit traps; that night they disappeared, and were not recovered till the following May, with the fluffy fragments of the unfortunates which were captured that evening. The snow was so deep that on one estate the trees were barked 8 feet up by the rabbits, which, raised up on the snow, ate also the bowed down branches. Up the glen I heard of an old woman having died at her son's house, and the funeral having to be put off for a month, and when the cottage was approachable sixty men had to come and cut a pathway for the coffin half a mile to the kirk yard!

I have been visiting a Rose garden in a most sheltered spot, approached by a two-miles drive through Firs faced with Rhododendrons. Within the garden walls a lower wall crosses, and along this is the choicest Rose border. The "leddy" laird is not a little fond and justly proud of her Roses. There is Mons. E. Y. Teas plump and promising; also Duchesse de Vallombrosa, President, Adam, and Souvenir d'un Ami, with Maréchal Niel, are fine against the wall; and then the dear eld friends! Banks of the old red Provence, a maiden blush standard thirty years old; the Persian Yellow, more like a bush than a plant; the white Cabbage, and an older white, which may well have helped the cockades of the rebel laird in "45" (N.B.—He had half a year in a cave in consequence before he escaped to Holland). Also all the Mosses are in great force, that effusive Bourbon Armosa, now so rarely seen, and the old York and Lancaster still celebrating the subsiding of the wars of the Roses. La Brillante I have been particularly pleased with; it is of fine colour and free habit. I wonder whether it will get into Mr. Hinton's garden Rose list?—A. C.

NOTES ON STRAWBERRIES.

As Strawberry matters are still to the fore I write a few lines in answer to "AMATEUR, Cirencester," who has, I hope, also received a private letter from me. He is mistaken about my soil. There is colitic lime just above me, but in my garden I have not a particle of lime, though only 200 yards in front of my house the limestone rock begins. My garden and house, &c., stand on what I believe to have originally been the edge of a great inland lake. We have 15 to 20 feet of pure sand mder 3 feet of soil, but on the top of the sand is a bed of gravel from 6 or 8 inches thick. In this gravel there are débris of the colitic limestone, but by no means a large proportion. I am now laying down a concrete lawn tennis ground, and to obtain the gravel and sand to put on the top of the stones I merely have to dig a large hole on one side the ground, and after throwing out from 3 to 3½ feet of earth I find the gravel and sand. I enter into these particulars because "AMATEUR, Cirencester," seems to fall into a mistake about my soil merely because a great portion of the range of Howardian hills are colitic; but we have very variable stratifications here, and very little north we come to beds of Kimmeridge and Oxford clays. So much about soil, which will in a measure account for a wet season not injuring my crops to any extent.

As to Dr. Roden's Strawberries, which he kindly sent me on trial, many of them are well known now, but the following is my estimate of the varieties

Alpha.—Very prolific and highly flavoured. In the opinion

of many the best-flavoured Strawberry I had this year.

Early Prolific.—Early and good. This is well known now. Early Prolific.—Early and good. Duke of Edinburgh.—Very good, but somewhat uncertain. Early Crimson Pine.—A great favourite of mine, which I shall certainly propagate extensively.

Hundredfold.—Prolific, but not equal in quality to last.

Amy Robsart.—Very good; high-coloured.

Orimson Pine.—Another very good Strawberry; in flavour rather sharper than Early Crimson Pine, and later.

Sir John Fulstaff.—A fine Strawberry, good bearer, and with me a late sort, but not so late as Traveller, Rivers' Eliza, or

Gipsy Queen.—Better this year with me than any other year.

Excelsior.—Fine colour and of good form; good quality.

Bonny Lass.—A good Strawberry, but not quite so good as some of the others.

Enchantress.—This is the only one which has not succeeded with me, but has rather deteriorated, the fruit being too small. -C. P. PEACH.

"AMATEUR, Cirencester," in a reply last week to Mr. Peach concerning Strawberries, speaks rather satirically, it would appear, as to my promise to produce some later varieties of that fruit than any at present in cultivation. The impression on my mind is that I started on my mission of raising new varieties, in the hope that I should rather improve the quality of both early and late sorts. I may also have aspired to raising some later varieties than any in existence. However that may be, if "AMATEUR" has kept pace with the times he should have perceived ere this that with regard to early varieties Black Prince, which is quite early enough for our climate, has been surpassed if not almost supplanted by Amy Robeart, Alpha, and Hundredfold, all of which are nearly, and in some seasons quite, as early as that variety, and the former of which especially I regard as the best early variety in cultivation, whether as to season of ripening, size, cropping, or flavour; better also than the so-much vaunted Garibaldi, which I grew some fifteen years ago under its earliest name of Marquise de Latour Maubourg. It is no discredit to that Strawberry to say that it has since received various other names, such as Duchesse de Trevise, Vicomtesse Héricart de Thury, and Prince Imperial; but Amy Robsart will well compete with it, as being earlier, larger, quite equal in flavour, a heavier cropper, and an equally good forcer. Of course I speak of my own soil and situation, but surely many have a better Strawberry soil than I have; whilst as to a second early (I place Sir Joseph Paxton as a third early) there is no Strawberry of its season to equal Early Crimson Pine. I have had this acknowledgment from all parts both at home and abroad.

Then as to late varieties, my friend's topic, I maintain that Enchantress and Excelsior are manifest improvements, the latter by its runners if allowed to run at will continuing to bear fruit till frosty weather commences; whilst Mrs. Laxton, partially issued late last season but now being more fully supplied, is decidedly late, and much more delicious than Elton Pine and Eleanor. "AMATEUR" cannot, I fear, be Elton Pine and Eleanor. keeping au courant with these matters and trying these novel-ties for himself, but is rather waiting for the dictum of others.

I have never claimed for my seedling Strawberries per-fection, nor do I wish to speak in terms of self praise further than is necessary for my own protection; but if I have made ever so small an advance in the right direction it is scarcely charitable on the part of any horticulturist, much more of a brother amateur, to throw cold water on the efforts of others. -WM. RODEN, M.A., M.D., Kidderminster.

SANDY AND DISTRICT HORTICULTURAL SOCIETY.

THE eleventh annual Exhibition of this Society was held on Friday last, under exceptionally favourable auspices as regards the weather, in the grounds of J. N. Foster, Esq., at Sandy, the capital of the agri-horticultural district of Bedfordshire. The Show was, considering the season, in all respects a great success, and it is feared but few other societies can this year compare results favourably with the Sandy Show, as many of the smaller and less-supported exhibitions will, after the season of 1879, succumb from the effects of adverse weather, financial results in most cases being very unsatisfactory.

The scope, too, of the Sandy Society, which includes sections of

result in crops of all kinds, whether of grain, pulse, or vegetables, has been found largely in favour of the former. The next comparison we must make will apply to a home farm where the chief portion of the farm is in pasture with only a limited area of cultivated land; and, in case the labour can be obtained, spade culture, where deep cultivation is a necessity, will be found far more advantageous than the plough culture. Whether the cereal portion of the crops or roots are most required, it must be remembered that not only the greatest weight of roots per acre will be obtained, but in the cereals the amount of straw grown will be most abundant; and this last is an important point where only a few acres are grown, more especially in connection with an extensive area of grass land. This leads us to another point connected with the subject, for at present, although hand labour is more expensive than it used to be, yet the same argument applies to animal or horse power, for the animals themselves cost more than formerly, and so do harness, shoeing, &c. When it is considered that in spade culture the whole requirements relating to tillage are simply the spade or the steel fork, the rake, and a wheelbarrow, &c., this is a small matter when it is compared with the various implements required for tillage by horse labour, and also the feeding of the horse, its first cost, its annual decay, and the various accidents to which it is exposed. There are also other matters to be looked to, such as hindrance by bad weather, &c.,; these, although only collateral, are nearly all in favour of the spade. We give, however, no money comparisons because the price of labour and other items vary in different

We will now refer to deep culture as connected with farms of considerable size and large areas of arable land; in fact, this is a large subject, requiring great experience to decide the many and various points which will arise for consideration upon the practical carrying-out of deep tillage of the land. We have noticed many instances where ditches have been filled in that the corn or many instances where diches have been filed in that the corn or roots always grow with great luxuriance in such cases. The home farmer will have also frequently seen the same results, and this will always be the means of calling attention to the advantage of deep culture. The first kind of soil we will refer to is tage of deep culture. The first kind of soil we will refer to is clay or strong loam, and if such land is too wet and requires draining—which is often the case, particularly where it lies flat and level—draining should always be effected before deepening the tillage, because if the land is stirred deeply before draining, it only deepens the basin and enables the land to hold more water without providing for its escape, which makes it more unfavourable for the growth of crops. In soils with a porous substratum it is, however, just the reverse, for it often happens, particularly where the subsoil is composed of gravel that there is just beneath where the subsoil is composed of gravel, that there is just beneath the level where the plough has been accustomed to work a hard iron-bound conglomerate of gravel quite impervious to water, rendering the land too wet in the winter and too dry in the summer. When this is broken through by subsoiling, the water can sink down freely, at the same time capillary attraction occurs, giving full assistance to plant life during the summer months. It is, perhaps, difficult to say how deep the land may be stirred with advantage; one thing, at any rate, is certain—that whenever the subsoil varies much it is desirable to render the land as much alike as possible in its productive capacity by deepening the soil throughout, in order that the patches of shallow land with impervious substrata may be made as pervious to the roots of plants as the best land so formed by Nature. An erroneous idea someas the best land so formed by Nature. An erroneous idea some-times prevails that it is not necessary to deepen the tillage for the ordinary crops of the farm; but why not? It cannot be said that the roots of the cereals will not go down as deep as the market gardeners' crops, and strictly speaking the farm crops of mangold, Swedes, and carrots dive down equally deep into the soils as the crops grown by the market gardener. To illustrate this matter we have taken up the roots of wheat and cats which have penetrated the soil to the depth of 5 or 6 feet, the roots of red clover to \$\frac{3}{2}\$ feet, white Belgian carrots and Swedish turnips to 5 and 6 feet, and in all probability the small fibrous roots which would break off in lifting the bulbs, \$\frac{3}{2}\$, go much deeper when the subsoil is off in lifting the bulbs, &c., go much deeper when the subsoil is naturally loose or made so by mechanical means. In ploughing land in the usual manner the soil is not moved more than about 4 or 5 inches in depth, except in winter fallowing it may some-

times be ploughed 6 inches deep.

There is one thing we have often noticed. When we have been looking over land in various districts, and when we desired to see what the land was capable of, we have invariably examined the cottagers' gardens, and we hold that whenever cottage gardens are productive the adjoining lands may be made so likewise. Nor is this a question of manure, for the farmer often has an almost inis this a question of manure, for the farmer often has an almost inexhaustible supply, whereas the labourer depends chiefly upon the depth of tillage; in many cases moving the land two spits deep, still keeping the best soil on the top. In fact, taking the mode of cultivation generally, the home farmer should remember that the utmost limit of production is not to be obtained by manure alone, but by a well-regulated system of liberal manuring accompanied by deep and effective tillage of the land. Again, whenever it is proposed to cultivate deeper than usual the work should be commenced by deep ploughing or digging during the early winter commenced by deep ploughing or digging during the early winter

months when fallowing for root crops, &c. The newly-broken soil then becomes mellowed by the winter frost and alternations of the weather, and is then in a fit state to become mixed with the other portions of the furrow slice in the after-ploughings during the spring and summer months. We know that it is frequently said when land is more deeply cultivated that more manure is said when land is more deeply cultivated that more manure is required; but that is not the usual effect, because it is well known that a given quantity of manure will produce far better results combined with deep cultivation. On soils which may have been chalked formerly, and the chalk having, as a considerable portion usually does, sunk into the subsoil, this by deep cultivation is exposed to the action of the atmosphere and brought into use, instead of lying inest in the unmoved substratum. Again it is instead of lying inert in the unmoved substratum. Again, it is often supposed that manure should not be buried too deeply in the soil, as the roots of corn cannot have the full benefit of it; but this is a great fallacy, as the depths which we have stated that the roots both of corn and vegetables descend into the subsoil will prove. With regard to the means of effecting deep cultivation to be obtained by the home farmer, it will depend much upon the extent of the arable land. Upon small occupations it is open only to the use of such implements as were formerly used—namely, the subsoil plough, intended to stir the subsoil alone. This implement usually follows the ordinary plough, and breaks up the pan or hard subsoil without bringing it to the surface, but it is laborious work for three horses, the top furnow having been turned with two horses. This work is, however, expensive, and upon occupations of considerable extent steam power should always be used in a way to be explained in our next article

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour .- The horses have lately, since the improvement in the weather, been employed in drilling turnips, and this work will no doubt be continued where only a short root lain has been will no doubt be continued where only a short root iam has been provided for. Late as it is turnips may yet be drilled after rye, winter cats, or the early white cats with a fair prospect of obtaining a useful crop, particularly if the Grey Stone or Early Six Weeks are drilled with a liberal application of superphosphate and ashes. Although the roots would most likely be rather small, yet, if the seed is drilled at 14 inches between the rows and the plants left shick in the rows as fair group may be obtained most plants left thick in 'the rows, a fair crop may be obtained, more especially if the autumn and early winter months should prove open and mild. When the turnip seed is drilled after a cereal crop as fast as the corn is cut, by ploughing, &c., between the rows of shocks of pooks the land is always moist, soft, and kind, and in much better condition than it often is after a fallow in a summer like the past, and also much freer from the insect enemies to the young plants. In the early districts the harvest will commence by reaping wheat in a few days—in fact, it may be said to have already commenced in a few cases of Talavera, Australian, and the early varieties of wheat sown early. It will this year be extremely important to sow trifolium as early as possible after the com is cleared, in consequence of slugs being so numerous, for we have never seen them more abundant than they have been during the past summer, and quantities of young mangold plants as well as other roots have been entirely destroyed. A friend sked our opinion upon the policy of sowing trifolium upon a clean fallow instead of after a corn crop, where so many slugs were sure to prevail after harvest; and further asked the best method of sowing, &c., upon fallow land. In reply we stated that there would certainly be a better chance of avoiding the slugs. the only enemy of any consequence, by sowing upon a fallow preparation, provided that at least 25 lbs. of seed per acre be sown, the land being rolled with the ring roller, and after sowing harrow once or twice with the chain harrow; this will not only insure a firm bed for the seed, but the seed will not be buried too deeply

but with regularity.

Hand Labour. — Hand-hoeing and horse-hoeing must be continued every fine day, as the weeds have not died after the hoeing as they do in ordinary seasons. We will suppose that by this time all the work of the farm has been forwarded in antitime all the work of the farm has been forwarded in antio-pation of the harvest, so that there may be no delay when it has been commenced. This is more especially necessary in this the latest harvest we have ever known, and anyhow it must prove an expensive one, because the length of the day is fast diminishing and the hours for work decreasing. It often happens when the harvest is unusually late that the corn is not ready for stacking so early in the morning, nor can the work be continued so late in harvest is unusually late that the corn is not ready for stacking so early in the morning, nor can the work be continued so late in the evening as when the harvest happens a month earlier. September and October are difficult months in which to provide a sufficiency of green fodder for dairy cows and cattle fattening under cover in the boxes; clover, however, may still be available for cutting and soiling cattle and working horses, and where trifolium, or vetches with rape, had been sown in May and June these crops will now prove extremely valuable. One of our tenants showed us the other day a capital piece of white Canadian oats nearly fit to cut with a fine plant of broad clover at the oats nearly fit to cut with a fine plant of broad clover at the bottom, and we advised him to cut the oats above the clover, in order that the latter may spring up and furnish a crop fit for soling cattle soon after harvest, it being good food until the first

1

frosts commence. In this way for a long series of years we have provided for cattle and horses in the autumn whenever the season has been favourable. The mangold of the previous year's growth will in most cases have been used up by the first week in November; the new crop will then be fit for feeding, for we never hesitate to use mangold at any period of the year, but we always feed with moderate quantities. We have found in our own practice ever since this root first came into use that they are as safe as any other root food for both cattle and sheep at any period with proper quantities of hay or corn, and if used with judgment and discretion.

JUDGING AT POULTRY SHOWS.

It is not long since there was a general outcry among fanciers It is not long since there was a general outery among fanciers about the paucity of poultry judges. It was supposed that there were few if any fanciers, besides the very few who then officiated at the great shows, who were competent to judge anything like a fair exhibition. Some half dozen judges, several of whom had had constant practice in their duties for over twenty years, had justly acquired great celebrity. The committee of one show followed the lead of another, and thought it absolutely necessary to secure the services of one of these gentlemen. Committees, too, were very exigent, and having got hold of them thought that no amount of work could be too great for them, so quick too, were very exigent, and naving got noid or them thought that no amount of work could be too great for them, so quick were their eyes and rapid their decisions. This was extremely unfair upon them. We have seen judges at the end of a long and laborious day poring anxiously into dark pens while assistants held flaring tallow candles, or allotting prizes to birds of delicate colours by the dim gaslight of Bingley Hall. The natural result was that they were terribly overdone, and that very frequently their awards by no means gave the general satisfaction that they formerly had given. A thoroughly tired brain cannot possibly make the fine discrimination that one fresh to the work can, neither is the human mind able to be as calm and collected in the bustle of an open or partially open exhibition as in the earlier hours when all is quiet.

What was to be done to remedy this difficulty? The poultry fancy had outgrown its original dimensions tenfold, and yet all fancy had outgrown its original dimensions tentold, and yet all the great shows in the kingdom were being judged by about the same number of men. Many people advocated trying "amateur" judges. The term is a little vague, for all the famous judges were amateurs of poultry. Most of them had formerly been successful both as breeders and exhibitors, and had retired from the pursuit content with their laurels of old and their experience. What, then, was meant by amateur judges was judges who still amused themselves with breeding and exhibiting. In another point, too, there would be some difference between the two classes of judges. Those who gave the amount of time and trouble to the duty that many of the celebrated judges to whom we have alluded gave, and in some cases still give, very naturally and properly received some honorarium for their services; while sudges who are still breeders and exhibitors, and only now and then forego showing to judge, can afford to give their aid gratinitously. To this suggestion there was great opposition from people, who without much practical experience in poultry breeding, had from diligent attendance at shows gained some superficial the word interest attenuance at shows games some superness throwledge, and thought that they might step into the shoes of the great judges and make judging a profitable employment. They were even warning committees of shows that amateurs would inevitably make a mess of judging, lose their heads, and give all the prizes to the worst birds. Managers of shows, in the apprehension of losing entries, were naturally timid about making innovations. At last one or two tried the experiment. If our memory does not deceive us the Committee of the Circucester Show were about the first to do so. It was soon found that exhibitors to whom it certainly signified most showed their approval by making large entries at shows so judged, and expressed themselves generally pleased with the result. Of course here and there seives generally pleased with the result. Of course here and there smatturs made mistakes, like other people; but all reasonable exhibitors make allowance for these, and that the fancying public are content with the innovation is clearly proved by the fact that at an ever-increasing number of shows amateurs officiate, and that some fanciers who strenuously opposed the system have come round to it. The first, and obviously one of the best, results that the strength of indexe are presented. is that a really adequate staff of judges are appointed for most shows of importance. Fortunately there has been no kind of rivalry between the old and new judges, but we find their names together in many a schedule; the former must find their labours much lightened by this subdivision of the work, and the latter may learn many a hint from the experience of their seniors.

We have before us the schedule of the Hemel Hempstead Show,

at which we see that not less than six judges will adjudicate in the poultry classes alone; two of these gentlemen have long been on the list of judges, three others have only of late officiated, while one well-known and successful breeder will make his debit, taking some of the local Hertfordshire classes. We also understand that at the shows to be held at the Agricultural Hall in connection with the dairy shows many of the classes will be taken by amateurs specially conversant with them. We always advocated judging by amateurs, and so are extremely glad to see this result. Of course it entails some practical difficulties which must be looked in the face. The chief of these arises from the fact that almost all breeders sell their superfluous stock, the breeding of birds of high pedigree would otherwise be too expensive a hobby for any but millionaires, consequently when making their awards they may come upon birds which they have hard said said this is certainly a difficulty but one we think bred and sold; this is certainly a difficulty, but one we think, which sounds more formidable than it really is. Of course an selected) will take care, when engaged to officiate as judge, to part with no birds without a stipulation that they shall not be brought before him. Again, if birds really come into close competition for prizes which he recognises as having ever been in his possession he will at once call in the side of the rest because on the will at once call in the side of the rest because on the will at once call in the side of the rest because on the will at once call in the side of the rest because on the will at once call in the side of the rest because on the will at once call in the side of the rest because on the will at once call in the side of the rest because on the will at once call in the side of the rest because of the side of the rest because of the side of the si possession he will at once call in the aid of a brother judge.

The task is a hard one, far harder to delicate constitutions than

the inexperienced would believe. Constant and strained attention is necessary in class after class for perhaps many hours, while the judge passes backwards and forwards, to the best of his power place passes backwards and lowards, to the cest of his power carrying in his eye the respective forms and merits of close competitors, and all the while tramps many a mile up and down the show hall. We can testify that one amateur, who probably has during the last two years officiated officer than any others, is almost always thoroughly knocked up by judging, save only when the public are bond fide excluded till all awards are made. We say bond fide, for somehow or other the clauses in schedules about the exclusion of the public are seldom rigorously carried out. Some committeeman has a friend who must leave the town by an early train, or the reporter of an influential newspaper must be propitiated, or some distant exhibitor has come from far to see the show, has made many entries, and promises more next year if admitted early. For these and divers other reasons a certain admitted early. For these and divers other reasons a certain number of people generally get in, and of this judges most justly complain. An admirable plan was honestly carried out at the Jersey Show last winter; at a certain hour the show room was locked up with only the Judge in it, and one person to carry his slips as ready to the office; not even the Secretary or Committee entered the room, and we know that the Judge found his labours through some large and super-excellent classes greatly lightened by this easy expedient.

Few things are done to perfection at once. The amateurs who are public spirited enough to officiate as judges may not always in their earlier attempts manage their time well; perhaps at first they find it hard to please themselves, and then horrified at their delay have to hurry on against the grain, but practice overcomes this difficulty. It is best to attempt judging first where competition is not likely to be very severe, and in classes with which the judge is specially conversant. As a rule no man is a really good critic of any breed which he has not kept himself, but when any one with what we have before called a fanciers' instinct has once thoroughly mastered the points of several varieties, he will not find it difficult to become a judge of kinds which he has not himself cultivated. A number of amateurs have been found who are self cultivated. A number or amazeurs have oeen round who are willing to take their turn in foregoing the amusement of showing to judge. We rejoice at this change in the poultry fancy, and augur from it more comfort and self-satisfaction to judges in general, and fewer disappointments to reasonable exhibitors.—C.

VARIETIES.

THE Shropshire Bee-keepers' Association held its Show at Shrewsbury in connection with the Floral and Horticultural Shrewsbury in connection with the Fioral and Horticultural Society, on the 20th and 21st inst., but the same cause that has damped so many enterprises this summer told there with terrible effect, the rain descending most pitilessly during almost the whole time of the Exhibition. The Hon. and Rev. C. Feilding, the Hon. Sec., spared no pains in securing entries and obtaining bees for manipulation in the tent borrowed of the parent association but the weather prevented an admirable programme from bees for manipulation in the tent borrowed of the parent association, but the weather prevented an admirable programme from being carried out; Mr. Cheshire as lecturer, and Mr. Abbott as manipulator, scarcely getting one hour each day for operations. While cottagers with skeps in the district find their bees in most cases starving, and often also queenless, it is worthy of remark that Mr. Harding, a local bee-keeper with frame hives, brought some splendid axtracted honey, several pounds' worth of which were sold. Mr. Abbott obtained first prize for hive, while a cottager entered the prize list with a good bar-framer of his own making, the basis of which was a lobster box, and the total cost to himself less than 2s. to himself less than 2s.

- THE fourth Exhibition of the Devon and Exeter Beekeepers' Association was held in connection with the Flower Show. The exhibition of bees and bee appliances was, considering this exceptionally poor season, of a satisfactory character. Numerous exhibitors sent hives and other bee appliances from long distances, some coming from Scotland. During the afterlong distances, some coming from Scotland. During the after-moon short addresses on bees and their mode of living were de-livered by Mr. S. Baldwin. Mr. S. Griffin officiated as Secretary of the Show, and Messrs. P. Williams, G. Fox, and S. B. Fox as Judges. Mr. Griffin was awarded the chief prizes for the best harvests of honey in the comb, for the best sample of becswar, for the best supers of honey, for the best observatory hive, and for loam and peat, in the proportion of about one part of the former to three of the latter, with a little sand added; drain to place the pots in a sancer of water, emptying occasionally to the pots well, and supply the plants abundantly with water

W. corymbosa (fig. 22).—This species has much the appearance of a small-leaved Iris, and the leaves are arranged in the same equitant manner; they are erect, sword-shaped, and very glaucous. Flowers arranged on a large corymbose panicle; they have regular six-parted tubular corollas, the lobes fist and spreading, colour rich purplish blue, each lobe having a spot of blackish purple at the base. The plant blooms during May and June in the greatest profusion, but when it

has assumed the proportions of a specimen, flowers may be ob-tained from it nine months out of the twelve. Cape of Good

GASTROLOBIUM.

The name of this genus alludes to the inflated seed pod. Amongst the species are many truly beautiful plants. They are characterised chiefly by their two-lipped and five-toothed calyx destitute of bracts, and by the petals of the corolla being of nearly equal length. Gastrolobiums mostly form being of nearly equal length. Gastrolobiums mostly form handsome bushes, and will by their beauty amply repay the plant-grower for the attention bestowed upon them. They do not, however, find favour with the antipodean farmer, where they are known by the name of "Poison Plants," cattle dying very quickly after eating their leaves. Pot in peat and loam, more of the former than the latter; make the whole tolerably sandy, and at all times give abundance of air.

G. villorum.—This handsome plant has oblong evate leaves, which are mucronate, cordate at the base, and sinuate at the margins, bright green above, paler below; the whole plant is villous. Flowers produced on terminal racemes, and from the axile of the upper leaves; standard deep red with a yellow spot at the base, wings crimson. It blooms during May and

June. Swan River. 1845.

G. bilobum.—Leaves alightly bilobed, verticillate, usually four in a whorl, dark green. Flowers arranged in terminal umbels; standard yellow, the wings and keel purple. It blooms during April and May. Swan River. 1803.

6. pyramidale.—A fine bold-growing, and when in bloom very showy species. The leaves are verticillate, arranged in threes, broadly ovate, deep green. Racemes axillary on long peduncles, in threes round the stem, and supporting showy flowers, which are deep orange yellow, saving the keel, which is deep red. On fine-grown plants three or four tiers of flowers are produced, rendering the plant when in flower very effective and highly omamental. It blooms from April to June, Swan River. 1850,

OXYLOBIUM.

This is another genus of the Butterfly-flowered Leguminosse. many of which are remarkably handsome. They require considerable attention to grow them into handsome plants, as they are very apt to become lanky and unbranched if neglected. Pot in peat and loam in about equal parts, adding plenty of sharp sand; keep the plants close to the glass, supply abundance of air, and pinch out the points of the shoots during the growing season to induce the production of laterals.

O. cordifolium.-A slender dwarf-growing plant with erect hairy branches. Leaves arranged three in a whorl round the stem, cordate ovate, subsessile at the base and hairy at the margin. Flowers produced in terminal umbels from all the tranches, colour orange scarlet. It blooms during May, June, and July. New Holland. 1804.

O. Pultonaca.—This is a very fine species. Leaves usually verticiliste, three or four in a whorl; sometimes, through some becoming abortive, they are simply alternate, linear obtuse, with the margins revolute. Flowers produced in large umbels, colour rich crange. It blooms during the spring months. New Holland, 1840.

O. obtacyfolium.—In this plant we have another extremely ornamental plant for the greenhouse. It is remarkable for its compact habit. Leaves oblong, linear obtuse, smooth and dark green above, clothed with a silky tomentum on the reverse side; margins revolute. Flowers arranged in a terminal corymb; standard rich orange with a spot of yellow at the base, wings and keel rich crimson. It blooms during April and May. King George's Sound. 1825.

PLATYLOBIUM.

This genus is characterised by the upper lobes of the calyx uniting and forming a large rounded upper lip. The seed pod is flat, broadly winged on the upper edge, many-seeded. The species here included are all handsome greenhouse plants, well worthy the attention of plant-growers. Pot in fibry peat and loam in about equal parts, with a good portion of sand added.

P. triangulare is a charming species. It is a free-branching compact plant. Leaves opposite, acutely triangular, and furnished with a sharp spine at the apex of each angle, deep green on the upper side paler below. Flowers produced in pairs, axillary, whilst in the bud of a bluish slate colour, when open very brilliant; the standard being rich orange with a central radiating belt of crimson, the wings being rosy crimson. It blooms during June and July. Tasmania. 1805.

P. formeeum (fig. 23).—This species well deserves its name,

and, like many others of the class to which we would draw attention, would soon become universal favourites if only shown to the horticultural public in good condition. It is a free-branching plant. Stems alightly hairy. Leaves opposite, ovate, ending in a sharp point, dark green above, paler below. Flowers axillary, mostly in pairs, the buds deep crimson; when expanded the back of the whole flower retains this colour, whilst the front side is rich orange yellow, saving a remiform belt of radiating crimson lines near the bottom of the standard. The flowers are produced through the months of June, July, and August. Tasmanis. 1790.

Fig. 23.—Platylobium formo

P. Murrayanum.—Leaves acutely triangular, armed with a sharp spine at the apex of the angles, opposite, and dark green. Flowers large and freely produced, on footstalks longer than the leaves; colour clear yellow, with a band of deep red at the base of the standard. It blooms in May and June. Tasmania. 1832.

P. parriforum.—The name of this would lead one to infer it

is worthless, but its size is only comparative, for although smaller than those previously named it is still large enough to be very showy. Leaves opposite, ovate lanceolate, smooth and dark green above. Flowers axillary, mostly in threes; colour clear orange yellow, the standard streaked with crimson. It blooms during June and July. New South Wales.

EUGALYPTUS GLOBULUS IN KENT.—Much has been written on the above species of Eugalyptus. A healthy young tree about 15 feet high is now growing in the garden of Lady

Herschel, Collingwood, Hawkhurst. It is partly sheltered from north winds by a wall near to it. Mr. Barnes, the gardener, tells me that it has been exposed to the severe weather of last winter, and it certainly looks none the worse for it.—WILLIAM POTTEN, Candon Nursery, Sissinghurst.

DUPLICATE ROSES.

I MUST thank "WYLD SAVAGE" for his interesting letter which I have only just seen, having been from home for a fortnight. His opinion as to the likeness of Fisher Holmes to Duke of Wellington I most thoroughly endorse. I cut flowers of both this morning, and they appeared to me to be identical, but on comparing the foliage that of the Duke appeared to my eye lighter and not darker than that of Fisher Holmes. The latter was cut from a maiden Briar, the other from a cut-back Manetti. Is not Marguerite Brassac lighter in colour than Charles Lefebvre? and has not Sultan of Zanzibar more scarlet under the dark painting than Reynolds Hole? But I confess that the latter Rose has not possessed its usual gloss with me this year. I do not think that anyone can doubt the extreme similarity of the three Roses, Exposition de Brie, Maurice Bernardin, and Ferdinand de Lesseps. I have, however, ceased to grow the two former, as I have conceived, rightly or wrongly, that the last is the best of the three. Is not the colour of Marie Finger of a brighter pink than that of Eugenie Verdier? and are not, as a rule, the flowers of the latter larger than those of Marie Finger? This subject is so interesting that I hope others will give their experience. By the way, do any of your readers know a Rose called Naomi? a good grower with quickly ripening and very thorny wood. It is not the old pink Rose of the name, but somewhat after, but distinct from, Abel Carrière.—KENTISH CURATE.

REVIEW OF BOOK.

Rambles in Search of Wild Flowers. By MARGARET PLUES. London: George Bell & Sons.

In recent years very numerous works have from time to time appeared devoted to the object of extending a knowledge and love of our native plants among the masses of the people, who have not the time or inclination to acquire strictly scientific botanical information. The object is a highly commendable one, for what can increase the pleasures of a trip into the country, especially during the spring and summer, more than an acquaintance with the various and pretty plants that are included in the British Flora? Moreover, the interest excited by some knowledge of the subject leads to greater efforts; thus the acute observation necessary to determine the names of such plants as are met with by collectors which were before unknown to them, becomes an excellent training for the mental powers generally.

The work now before us is one of the class above referred to, and has already been favourably received, for this is the third edition. It treats in a popular and easy manner of the most noteworthy wild plants under the different natural orders in which they are included. A brief review of the structure of plants is given, introducing only such technical terms as are absolutely necessary in describing the various species. The most important properties and uses are fully treated, and many instructive and amusing anecdotes assist in rendering the book of interest to the general reader. We will cite one of these, which appears on page 21 under the natural order Ranunculaceæ, and is a fair example of their character.

"The beautiful scarlet Anemone, the superb ornament of Italian woods, and also of our gardens, is a much valued member of this family. It is told of one of the Mayors of our large towns that when first this flower was introduced into our English gardens he exceedingly coveted some of the seed. This he offered to buy, but the monopolist refused to sell; so his Worship tried finese to gain his purpose, and proposed to the florist that, as he would not part with his Anemones, the Town Council should come in state to see them. This was esteemed a great honour; and the Mayor managed in his progress to drag the skirt of his velvet robes over the bed of Anemones. The feathery seeds adhered as a matter of course; the blooms of these flowers coming in such long succession and the fruit ripening fast, so that flower and fruit were clustered together; and no sooner did he reach home than with most unlordly haste he picked off the seeds and sowed them. The next year his garden was adorned with the coveted flowers!"

For a work of this description the nomenclature is remarkably accurate, and the subject is fairly well treated throughout. The illustrations are numerous, but the majority are not

of high artistic merit. The authoress, already well known in the literary world, has given us in this book a pleasant record of her rambles, which cannot fail to please the majority of readers.

CLETHRA ARBOREA.

It may possibly interest your readers to hear that I have a specimen of Clethra arborea which has been in the open air for nearly twenty years without any protection whatever but that of the neighbouring trees and shrubs. I measured its height this morning, and find it to be exactly 22 feet 10 inches. It is certainly a magnificent shrub, most luxuriant both in leaf and blossom, and it escaped the last severe winter without losing "a feather."—P. FITZGERALD, Knight of Kerry.

ABOUT LIVERPOOL.-No. 2.

In noticing in a very brief manner a few of the private gardens about Liverpool it may be well to explain that they are not referred to as being superior to others in the same district. They were visited because they happened to be conveniently accessible, and were not "selected" because of any particular local fame attaching to them. By a different course possibly something of a more striking aspect might have been found, but the general character of the horticulture of the locality would not have been so fairly represented. For instance, Knowsley was not visited, a rainy day intervening, but the admirable practice of Mr. Harrison is readily acknowledged by those gardeners of Liverpool who are competent to judge, and regret was freely expressed that Lord Derby's fine seat could not be reached. A garden of which readers of the Journal will naturally like to hear something is that wherein Mr. Bardney practises, at

NORRIS GREEN.

This, the seat of Mrs. Pemberton Heywood, is situated at West Derby, about four miles from Liverpool. Considering that it is so near to the town the estate is of considerable size, and the gardens are tolerably extensive. Trees, and Conifers especially, do not appear to flourish well owing to some adjacent chemical works contaminating the air when the wind is in a certain direction. It is sad to see fine specimens struggling for existence, and not particularly encouraging for a gardene trying to establish others; but young and energetic men will keep trying, and they not unfrequently succeed when more steady-going "old stagers" would make no venture. It is noticeable that the only variety of Ilex (Holly) that grows freely at Norris Green is the large and glossy-leaved Hodginsi, and the fact is worthy of mention for the benefit of those dwelling in suburban districts, and who require shrubs that will "stand smoke." Rhododendrons also do well in the panelled American garden near the large conservatory, and in front of the mansion some grand old clipped specimens of Evergreen Oaks arrest attention. On one portion of the extensive lawns deciduous trees abound, almost entirely shading the grass, and the outlook from the windows is cool and refreshing during a Mr. Gladstone has more than once been at work hot day. with his axe on the estate, but he has certainly not materially deprived the lawn of timber.

But the chief feature of Norris Green is the glass. Long ranges are devoted to Peaches and Vines, and other houses to plants; the houses are heated by 8000 feet of 4-inch pipes, and boiler power (two large saddles) is provided for 20,000 feet. The Peach borders have been renewed by Mr. Bardney, and the trees lifted and replanted. Lifting is done almost at any time when the fruit is not swelling if it is necessary to check over-luxuriance. The trees are in admirable condition, thinly trained, with short-jointed wood, dark clean foliage, and superior fruit. Figs are also grown on the back wall of one of these houses.

The Vines are also undergoing the process of renovation, the roots having been raised and placed in new compost; this, with heavy manurial top-dressings, has caused the emission of numerous healthy feeding roots that cover the surface of the borders like a network. Old spurs and rods are also being removed and new growths encouraged. Vines thus managed are certain to produce very useful crops. Some very large houses have been planted with young Vines. In one house the Vines were planted in the spring just when the buds were swelling, those in the adjoining house not being planted until the July following, when they were in full growth. Thus the two systems are fairly seen side by side, the borders being

precisely the same in the two houses. Those planted last, in [summer, are by far the best, having produced canes that cannot well be surpassed. They are planted in narrow inside borders, which are increased in width yearly by piling up front linings of turves with a few bones and some charcoal intermixed. Through the edge of the borders thousands of white roots are protruding in quest of more room and food, which will be shortly given. How carefully these precious rootlets would be guarded by some gardeners! to break one of them would almost be a crime. Mr. Bardney values them, but he does not treat them so tenderly. He observes that when the tips shrivel on exposure to the light three or four fresh rootlets issue just within the soil. Turning this fact to account the tips of the protruding roots are shaved off each time a fresh lining of turves is added, and thus the roots are increased, the food in the border is appropriated, and the Vines prosper.

A very large house is devoted to Melons. Some are grown in troughs, some in beds, and others in pots. Half a dozen or more plants are planted at intervals throughout the season, and thus ripe fruit is provided over the longest possible period. Nearly all the leading varieties are grown, and perhaps at some time the grower will tell us of their relative merits.

A large span-roofed stove is full of plants-healthy and clean, and valuable for various decorative purposes; the roof being a magnificent mass of Allamandas, grown as described on page 101. Another fine house is wholly occupied with Boses. The central bed is planted with Teas trained to a trellis in the form of an arch. Thousands of blooms are produced, and the plants are kept free from insects and mildew by a very simple process. A lump of soft soap (2 is. or so) is boiled in a saucepan; this is placed in a large pot in the house and mixed with five or six gallons of water. About half a pint of this solution is placed in an ordinary water pan full of water when the house is being syringed, hence the cleanliness of the plants, and the water does not injure or despoil the purest petal. Roses are produced all the year round, and in addition to this fine house of Teas 250 Hybrid Perpetuals are grown in pots. Other houses and pits are devoted to the forcing of Vines in pots, French Beans, and the various flowering plants that are required in such large numbers for the mansion and conservatory. This is a great work at Norris

Green, and plants are grown by thousands.

The conservatory is 70 feet long by 40 wide, and has a ridge-and-furrow roof. In the centre are Camellias, handsomely trained pyramidal specimens in superior condition. The border is partitioned into narrow allotments, so that the plants can be the better transplanted at any time—an admirable provision. Luculia gratissima planted out thrives well in this house. A stage surrounds the structure, excepting, of course, at the four entrances, and this stage is always gay with plants in pots. Five thousand bulbs are forced, and all other decorative plants are grown in the same proportion. It is a wonder how they are all produced, seeing that about nine-tenths of them must be grown in fruit houses. An additional plant pit is certainly a desideratum. Chrysanthemums are largely grown, those for producing blooms of exhibition quality, but not for exhibition, being in fine condition. Strawberries are forced in great numbers, being in fine condition. Strawberries are rorced in great and the plan of layering in fruiting pots being found much better than layering in small pots and then transferring them to larger. The plants are fine for the season, and those for producing ripe femit at Christmas are now showing their flower trusses. The fruit at Christmas are now showing their flower trusses. The varieties chiefly grown are Sir Harry and Vicomtesse Héricart

The kitchen gardens, of which there are two, are well cropped and managed—indeed, the entire garden affords ample evidence that every department is skilfully conducted. Mr. Bardney, too, has the pleasure of knowing that his labour is appreciated, for Mrs. Heywood cherishes her plants and gardens, and makes her gardener, with all her dependants, comfortable. About a mile from Norris Green is

LARKHILL.

This is the residence of Hugh Jones. Esq., and brothers, and the gardens are under the management of Mr. Rogerson. The great feature of interest to the visitor is a grand house of Muscat of Alexandria Grapes, which is worth a long journey to see. The structure is span-roofed, standing east and west. The Vines are planted on both sides and are brought over the entire roof: thus those planted on the north side are trained up the roof on the same side and down the southern roof; those on the opposite side being trained in the same mannernamely, up one roof and down the other. There is no crowd-

ing, the rods being nearly 4 feet apart, and, what is also important, the spurs on the rods are from 18 inches to 2 feet apart. The crop is a grand one. The bunches commence close to the ground; indeed some of the finest of them nearly touch it, and they hang with great regularity all over the house, but, as a rule, those on the south roof are the finer. They are nearly all of handsome tapering shape and range from 3 hs. to 4 hs. in weight. The Vines, which are several years old, are planted inside, but the roots have access to outside borders. They were lifted a few years ago, and feeding roots have since been kept near the surface by heavy top-dressings of rich manure and copious applications of water to the inside borders. The outside borders are dressed with good manure annually, but are not covered with fermenting materials.

A fact worthy of notice is the free growth of foliage that is permitted and its disposition. The roof is not unduly crowded with foliage, but growth is encouraged from the base and termination of the rods, this growth trailing on the inside border, which is covered as thickly as an Ivy bank with foliage. The first thought that arises is, Does not this extraordinary growth deprive the bearing laterals and bunches of some support? The crop gives a very emphatic answer in the negative. From the base of one or two Vines growths of great vigour were rambling for 20 or 30 feet on the surface of the border, and yet the wood and fruit of those Vines were as fine, if not finer, than those of other Vines which had not produced such luxuriant basal growth. This growth is encouraged for the purpose of stimulating active root-action, from which the crop benefits. On lifting up the mass of foliage resting on the border the manure surfacing is seen to be completely permeated with white roots, which go far to explain the fine condition of the Vines and crop. This almost wild extension of laterals in positions where they do not crowd the Vines I observed at Norris Green and in some other places "about Liverpool" where Grape-culture is well carried out, and the fact is worthy of mention and of the attention of cultivators in other districts where a different and closer system of stopping the laterals prevails. There are other vineries at Larkhill, and good crops of Grapes in them; but in one house situated in a low position from which an outlet cannot be obtained for superfluous water, even such a good Grape-grower as Mr. Rogerson undoubtedly is cannot produce a satisfactory crop.

The walks in the kitchen garden have cement edgings of the cable pattern, and the quarters contain a profusion of well-managed fruit trees, but the crops are scant and the Apples not much larger than marbles, so late is the season. The wall fruit is in a similar backward state, and cannot be of any

material value.

Larkhill is not a "plant place," yet plants are well grown for decorating the conservatory; notably Azaleas, which are large and in fine condition, and several large and healthy specimens of A. amœna must be very valuable, in early spring. Chrysanthemums are also grown, as they are in all gardens in the district; but, as before mentioned, the principal feature of Larkhill is the grand house of Muscat Grapes.—J. W.

CARBOLIC ACID AS AN INSECTICIDE.

"G. O. S." has done nearly the same thing in using creosote and water as if he had used carbolic acid, the only difference between creosote and carbolic acid is that one is from wood tar the other from coal gas tar; but creosote is seldom crystallised into a pure crystal salt as carbolic acid is. It is not, however, necessary to use the better class of carbolic acid merely to kill slugs. If used on grass care must be exercised, as a strong solution will kill grass. If to kill slugs on dug ground about an ounce to four gallons is enough. For syringing in a greenhouse, stove, or vinery I use the purer crystallised carbolic acid, but dilute it first in about eight times its weight in water, and do not use much more than from 15 to 20 grains or minims per gallon of pure soft water, but add soft soap.
"AMATEUR" speaks of salt. No doubt a winter top-dressing of salt is useful for killing slugs, and also as a manure for the ground; but it should be dug two spits deep before planting time, except for such crops as Peas, Celery, and Broccoli.— C. P. PEACH.

THE HAILSTORM RELIEF FUND.

In reply to "F. R. H. S.'s" inquiry, permit me to state that not a single case has come under my own notice in which sufferers from the recent hailstorm were insured. As a matter of course, if any sufferer were insured and made application for relief such application would not be entertained. I am more than ever impressed with the urgent need that exists for the establishment of a relief fund, and more especially is it needed on behalf of the many jobbing gardeners who have put up a little glass in which to grow plants for the gardens they keep in order. These men have had a very bad time of it owing to the continuous wet weather; they have not been able to work half their time, and their glass remains broken for lack of means to mend it.—RICHARD DEAN, Hon. Secretary, Hailstorm Relief Fund, Ranelagh Road, Ealing, W.

[One of the agents of the Essex County Hailstorm Insurance Company writes in reply to "F. R. H. S." that glass structures can be insured at a charge of 1s. 3d. per hundred square feet.]

A WELSH ROSE GARDEN.

WALES cannot at present be regarded as standing high as a Rose-growing country, but from the various indications which I have seen lately I am inclined to think something will yet be

heard of Welsh-grown Roses.

Rose gardens under the management of keen Rose-growers are springing up in many parts of the Principality; and the one recently formed at Lord Windsor's seat, St. Fagan's Castle, Cardiff, may not only be taken as an illustration of this statement, but also as a type for others to follow who contemplate forming a Rose garden. The one at St. Fagan's is not on a very elaborate scale, but it surpasses in its way anything I have seen. It is simply a piece of ground about 50 yards long by 30 yards wide, surrounded by a wall about 12 feet high. This wall is wired on the fruit-tree-training system, and Tea Roses of all the best varieties are planted at the bottom of the wall and trained up and over the wires. Many of them have been recently planted, others are well established, and all give promise of covering the walls with a profusion of Tea Roses of high quality, besides furnishing an abundance of fine buds and flowers for decorative purposes. All round the enclosure next the wall there is a wide border planted with dwarf and standard Roses to the number of between four and five hundred. The centre is a square of grass which will be laid out in small Rose beds during the coming winter. The varieties grown are those named in the election of Roses in the Journal of Horticulture. The health and vigour of all show that much care has been taken in preparing and planting, and the fine blooms which Mr. Crossling has won prizes with at Hereford, Cardiff, and other places prove that the site of the garden is good and the mode of culture adopted successful. -Visitor.

NOTES ON VILLA AND SUBURBAN GARDENING.

THE time has now arrived for the propagation of all plants required for next summer's display. A cutting is simply a part of a branch with two or more joints. Geraniums are more often taken off longer than this; but with Verbenas, Ageratums, Lobelias, Fuchsias, Petunias, and Heliotropes very small pieces can be inserted thickly together. Cut the base of the cutting clean across with a sharp knife, removing the lower leaves; and in the case of Geranium cuttings it is a very good plan to allow them to remain for a few hours exposed, so that the wounds may have some chance of drying before insertion in the soil. Six-inch pots some chance of drying before insertion in the soil. Six-inch pots are very convenient for cuttings, as they can be conveniently placed upon narrow shelves near the glass, and the plants are not so liable to damp-off as in larger pots or boxes. Place about half a dozen Geranium cuttings in each pot, and about a dozen or more of other softwooded plants. The present is also a good time to study arrangements for another year. Pick off dead flowers, and keep the beds neat and trim to make amends for the somewhat meagre growth and scarcity of flowers—the effects of the wet

VINES,--Plants that are carrying ripe fruit will be benefited by the assistance of fire heat to dry up the condensed moisture, which is very apt to cause berries in the centre of bunches to bewhich is very apt to cause berries in the centre of bunches to become mouldy and decay. Go over the bunches frequently, and remove with a pair of Grape scissors any mouldy and shanked berries. A little fire heat will also help to ripen the wood; air must be given freely, and laterals should be closely pinched. We fear that in the neighbourhood of London many Peaches and Pears will not ripen this season; and we must impress on all to clear away superflower growth to admit a much light and any clear away superfluous growths to admit as much light and sun-shine as possible, for well-matured wood is the key to successful fruit culture.

CUCUMBERS AND MELONS.—Where these are grown by the aid of dung frames a good lining of brisk hot manure placed round the bed will greatly assist the plants during the cool nights we

may now again expect, and it would be well to cover the lights every evening with mats; and a more even temperature will be maintained in the frame. If the plants are crowded thin and regulate the branches, and water Cucumbers on bright afternoons as they become dry. Melons will require little or no water after as they become dry. Melons will require little or no water after this, and the fruits should be placed on pieces of slate, tiles, or

wood to preserve them from decay.

KITCHEN GARDEN.—Pea haulm, Broad Beans, Lettuces run to seed, or any plants of a similar description that have ceased to become useful should be instantly removed and the vacant ground planted with Curled and Cottagers' Kale, so that there may be no deficiency of vegetables during the long winter months. Thin Turnips as they become large, and if there is any fear of the supply Turnips as they become large, and if there is any fear of the supply running short make another sowing; the tops will be useful in the spring. Onions sown early are now ready for lifting, and should be well dried before being stored away. A dry airy room is the best place to hang them in. Cold weather does not harm them, whereas warmth and moisture cause them to grow. Lift late crops of Potatoes, and plant Cabbages. Small varieties such as the Cocca Nut, Wheeler's Imperial, or Carter's Heartwell Marrow, may be planted from 9 inches to a foot apart every way; but larger varieties, such as Enfield Market, require a space of 2 feet between the rows, unless it is intended to take out every other plant in the spring.

other plant in the spring.

Chrysanthemums.—Most of these plants will now have filled their pots with roots, and may be beneficially watered with liquid manure. It is not wise to apply it very strong, especially at first, and to give liquid manure at any time so that it leaves a deposit on the top of the soil is more injurious than otherwise. Keep the shoots well tied out and make them secure, or the wind may snap them off. Plants intended to produce large flowers should now be disbudded—that is, if the growing points of almost every variety are examined a small flower bud will be observed growing in the centre of three or four young shoots; if these young shoots are carefully removed this minute flower bud will continue to advance in size and make a large first-rate flower. The care the buds and plants now receive makes all the difference between the

production of first-class and inferior blooms.

WORK FOR THE WEEK.

KITCHEN GARDEN.

CABBAGES form the most important spring crop, they should therefore receive prompt attention. Plants from the July sowing will now be sufficiently large to be planted out. Do not allow them to stand long in the seed beds, as they become weak and them to stand long in the seed beds, as they become weak and leggy. We usually plant after a crop of Onions, the ground being turned over and properly prepared by the addition of well-decayed manure; 18 inches apart every way will be sufficient space for the early sorts. Slugs and grubs should be kept in check by dusting the plants over, when damp, with wood ashes and an admixture of soot. Plants from the August sowing must be pricked. mixture of soot. Plants from the August sowing must be pricked off as they become large enough to handle. It is important they be kept sturdy, which will enable them to endure the winter more safely. Make another sowing of Cauliflower seed, and sow Lettuce seed of the hardy varieties. The crop of winter Spinach should be thinned before the plants become too large; allow sufficient space to prevent damping off during bad weather, and keep the surface soil between the rows well stirred. Thin out autumn-sown Onions to about 3 inches apart, every alternate one being afterwards removed for early spring use as required. The being afterwards removed for early spring use as required. The spring-sown Onions are very late; they should be pulled as soon as mature, exposing them in the sun for a few days before storing away. As ground becomes vacant plant it with Rosette Colewort, Lettuce, Endive, and late Celery. Radish seed should now be sown in sheltered situations. Tomatoes should have the leaves removed from over the clusters of fruit, in order to advance the As ground becomes vacant plant it with Rosette Coleripening process. HARDY FRUIT GARDEN.

There is yet time to plant Strawberries; select well-rooted runners, giving preference to those that have been layered and well-established in 3-inch pots. The Strawberry requires a deep rich soil and an open situation, for the roots penetrate the soil to a considerable depth when the ground is deeply trenched and well are the related to give the related to give the select of manured, and this enables the plants to withstand the effects of dry hot weather. Old plantations should have the runners removed; keep the soil lightly stirred between the rows. When the Raspberry season is over the old bearing wood should be cut out at once and the young early thinged out retaining from four at once, and the young canes thinned out, retaining from four to six of the strongest. It will be advisable to secure them loosely to the stakes or trellis until the growth is completed and the wood well ripened. Net up a sufficient number of bushes of and White Currants, with Morello Cherry trees; these, owing to the lateness and scarcity of other fruits, will be very acceptable. Apricots are only now ripening, and there is not any sign of ripe Peaches, except the very early varieties. Plums are very late, and maless the late summer and autumn be unascally fine the fruit unless the late summer and autumn be unusually fine the fruit will not ripen. The summer Pears and Apples are a month late. They should be gathered as they ripen. Birds, especially the blue

titmouse, have a great relish for the softer-fleshed varieties. Intimidation is of no use, as they soon learn the difference between blank and shotted carrridge; the latter is the sure remedy. Wall trees will require to be looked over frequently for the stopping or removal of useless shoots, and bush and espalier trees require similar attention. Secure the extensions to the wall or trellis, as they are liable to be broken by the wind.

FRUIT HOUSES.

Cucumbers.—Make a sowing of seed to obtain good bearing plants about Christmas. There is no better variety for fruiting all through the year than a true stock of Telegraph. Paragon appears to be a very useful free-bearing variety. Push forward the work of clearing out the house intended for their reception, attend to any repairs that may be necessary, paint or thoroughly cleanse the woodwork with soap and water, limewash the walls, adding a little flowers of sulphur, and clear out the old soil and spent manure. If fermenting materials are employed for bottom heat they must be now prepared; stable litter and Oak or Beech leaves in about equal proportions thrown together, moistened and turned over two or three times, answer very well. Tan is a good material, as it retains heat a considerable time. Assist the autumnfruiting plants to make strong growth, remove all the staminate flowers and tendrils as they appear, being careful neither to over-crop nor overcrowd the plants. Less moisture will now be necessary unless the weather is very bright, but lightly syringe the plants at closing time or about 8 P.M., and sprinkle the walls at 7 or 8 A.M. In pits and frames linings will be necessary to main-

or 8 a.M. In pits and frames linings will be necessary to maintain the plants in a free-bearing state; keep the foliage rather thin, and stop the growths one joint beyond the fruit. Sprinkling overhead should be discontinued, except on sunny afternoons. Admit air early in the day, and close early in the afternoon.

Melons.—The quality of Melons has been very variable this season, and those from frames have been few and poor. The plants in frames with fruit ripening should have very little water, and if linings be employed air can be given more freely, which will assist the fruit in ripening and improve its quality. Late plants with the fruit swelling off should only have moderate supplies of water, and on bright afternoons sprinkle overhead and close early; admit air early and maintain a temperature through the day of from 80° to 85°, and if the lights are covered with mats at night the temperature will be less influenced covered with mats at night the temperature will be less influenced

by the external air.

PLANT HOUSES.

Greenhouse.-If a few seeds of Schizanthus are now sown good plants will be obtained for conservatory decoration; they afford a profusion of flowers and are very attractive. Hydrangea cuttings should now be obtained from plants that have their buds well formed; take the cuttings with three or four joints, and insert singly in 3-inch pots filled with turty loam and sand. Place the cuttings in gentle heat, and when rooted remove them to a cool house. These make very compact plants, producing fine heads of bloom. H. Thomas Hogg has fine heads, the flowers are much larger than H. hortensis, and white. It is a fine variety and free flowering. Encourage Mignonette by keeping the plants near the glass, so as to impart all the strength possible, and pot them on as they require it. A few good plants will produce more and finer spikes than a number of weakly plants. Standards are very useful during the winter months, especially if trained to umbrellashaped trellises. The plants must be kept free from green aphides which are sometimes troublesome, and if allowed to remain soon injure the appearance of the plants. If a quantity of bloom be required for cutting it will be better afforded by plants in pits. Plants from seed sown early in August are the most suitable for this purpose. The pit must be heated to maintain a temperature of 45° to 50°. Tree Carnations for forcing must have every attention in keeping them free from aphides, and afford all the light possible so as to render them dwarf and stout. Solanums that have been planted out should now be lifted and potted in 6 or 7-inch pots, then place them under a north wall, as if allowed to flag they will lose their lower leaves. Epiphyllums are useful winter-flowering plants, and are generally grown as dwarf standards on the Pereskia stock. They will now have completed the growth, and should receive no more water than is necessary to growth, and should receive no more water than is necessary to maintain the growth fresh. They require a warm greenhouse temperature. Although grafted plants are usually grown, Epi-phyllums succeed on their own roots. Cuttings strike freely in sand if kept close until rooted, then pot them singly in fibrous loam. These dwarf small plants are useful when in bloom for a variety of purposes. Few plants make a finer display in spring and early summer than Clematises grown in pots and trained to Such as have been grown and flowered through the summer should be placed on a bed of ashes, where they will receive all the sun and light possible so as to mature the growth, and in case of heavy rains lay the plants on their sides. Roses in pots should be placed where they will be benefited by the sun's heat and plenty of air. If there is any trace of insects apply an insecticide, or for mildew flowers of sulphur. Pot a good batch of Roman Hyacinths, employing turfy loam with a fourth of well-decayed manure and a sixth of sand, pressing the soil firmly around the bulbs and keep the crowns clear. Place the pots on a bed of ashes in a

frame, covering them about 6 inches deep with ashes, and the soil being moist no water will be needed until the bulbs have produced When well rooted remove the plants to a shelf near the glass in a house where a gentle heat is maintained, and they will flower strongly by November or early December. Another batch may be allowed to come on gradually in a cool house, and will flower at Christmas. A batch of the Paper White and Double Roman Narcissus should be potted without delay, and if treated similarly to the Roman Hyrcinthe will flower at the same posited. similarly to the Roman Hyacinths will flower at the same period. Guernsey and Belladonna Lilies make a fine display in late summer or early autumn, and should be obtained and potted without delay. After flowering they should be kept near to the glass and well supplied with water, so as to enable them to make and complete a good growth. Place the plants outdoors after May in the full sun, and do not allow them to become very dry, not even when at rest. We keep our bulbs in the greenhouse constantly on shelves except when flowering, treating them similarly to Vallotas. The last mentioned are now throwing up their scapes freely and must be well supplied with water. They are the finest late summust be well supplied with water. mer ornaments of the greenhouse.

Cineraria seedlings or offsets for late bloom should be potted off singly, placed in a cold frame, and kept moist and shaded until established. Plants in small pots should be shifted into a larger size before they become rootbound. Those for autumn flowering size before they become rootbound. Those for autumn flowering should be kept cool, supplying them with liquid manure, and exposing them more fully to the sun to harden the growth. Primulas well advanced for flowering should have liquid manure occasionally, and shade only in the hottest part of the day for an hour or two. Plants for later flowering should be shifted into larger pots as they fill the pots with roots. Calceolarias must not be allowed to draw up weakly in the seed pans, but be pricked off as soon as they can be handled, keeping them cool and moist. Seed may yet be sown, but the earlier the better. Violet plants from runners or anckers put-in in April or early May will plants from runners or suckers put-in in April or early May will be showing bloom, and if required for pots or planting in frames the earlier it is done the better will be the autumn and early winter bloom, as the plants recover the check of removal before the blooms are too far advanced. For frames a sheltered sunny situation should be selected, and if the ground is not well drained put in 6 inches of rubble, and plant in 6 to 9 inches depth of turfy loam with a third of leaf soil, watering well after planting, and leave off the lights until the weather becomes wet and cold, when they may be employed to throw off heavy rain and secure a genial well-ventilated atmosphere. In potting employ loam with well decayed manure or leaf soil one-third, as there loam with well decayed manure of lear soil one-third, as there is no fear of the plants producing too much foliage providing they have had plenty of room to make a good growth. Place the pots on ashes at the back of a wall out of the sun for a few days, and then in a cold frame, removing them to the greenhouse as

TO CORRESPONDENTS.

** All correspondence should be directed either to "The Editors" or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense. Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects,

and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

CORRESPONDENCE.—Dr. Hogg is at present in the south of France, and all communications addressed to him personally will have to remain at this office till his return.

SEEDLING FELARGONIUM (Mrs. W. S. P.).—The variety resembles Master Christine, and is no doubt a seedling from it; and if it is of dwarf habit, and at the same time retains its petals well, it will be useful both for pot culture and bedding purposes. The truss is very fine, and the colour a cheerful rosy pink.

CUTTING DOWN ZONAL PELLRGONIUMS (North London).—Your plants, which have been "flowering all the season in the greenhouse and have become tail and leggy," should be cut down to where the wood is hard and brown at the base of the stems. If the plants can be placed in a frame where the lights can be drawn over them during heavy rains they will be better there than outdoors, but they will be better outdoors during September than in the greenhouse. In a short time the plants will make fresh growth, and when this is about an inch in length all the soil should be shaken from the roots, the plants being potted firmly in much smaller, clean, and well drained pots; and if kept in a frame for a time and then afforded a light position in the greenhouse will make dwarf bushy plants for next year's flowering, and a considerable number of them can be wintered in a CUTTING DOWN ZONAL PRIARGONIUMS (North London) .-- Your plants.

comparatively small space. The shoots severed from the plants may be made into cuttings, inserting one in the centre of a 3-inch pot, or three or more in pots of a larger size, as may be most convenient. They will strike readily in a cold frame, or in the open air if sheltered from heavy rains.

readily in a cold frame, or in the open air if sheltered from heavy rains.

TEA ROSES AT CHRISTMAS (Lady B.).—They can be had if you have light and sufficiently heated structure for growing the plants in. The principal Rose nurserymen grow Tea Roses under glass, producing strong plants with well matured wood by September. Order the varieties you require, stating the purpose for which the plants are needed. These plants, which will require little or no pruning if placed in the house towards the end of October and syringed according to weather, starting them with a minimum night temperature of 50°, and gradually increasing the heat as growth advances, will flower at the time required, and with generous treatment will continue flowering for a considerable period.

EMIGRATION (Anglescree)—A young man should be prepared to do other

EMIGRATION (Angieterre).—A young man should be prepared to do other kinds of work than that to which he has been accustomed in gentlemen's gardens in England before he emigrates to the colony you name, unless he can obtain the aid of any influential colonist in procuring a situation.

ROSES NOT FLOWERING (J. P.).—It is a shy-flowering variety and requires a drier locality than yours to mature its growth. Probably if you plant it in a dry and warm position near a south wall, and thin out the shoots in summer and prune very slightly in winter, you may succeed in obtaining some flowers.

ROSES UNHEALTHY (Munster).—Your Rose trees appear to be seriously attacked with the black fungus, which is not easily eradicated. We have often checked the sprearl of the parasite by dissolving 2 or 8 ozs. of soft soap in a gallon of water, and with this syringing the trees, and further dusting the foliage when wet with sulphur. It is very desirable also to enrich the soil with manure, applying also copious applications of liquid manure to the roots to stimulate robust growth. If any of our Rose-growing correspondents can name a more effectual cure for the fungus we shall be glad to publish it.

publish it.

CLIMBING ROSES FOR GREENHOUSE (J. H. S.).—In your previous letter you employed the term, "planted out on or under the stage," which did not imply planting in boxes. Place the boxes on the stage, drain them well, and plant the Roses in turfy loam with a third of decayed manure and a little soot, say about a pint or nearly so to a peck of the compost, and half a pint of bone dust, pressing the soil rather firmly in the boxes and about the roots. Besides Maréchal Niel which you have, Gloire de Dijon. Belle Lyonnaise, Cheshunt Hybrid, Climbing Devoniensis, Celine Forestier, Niphetos, and Marie Van Houtte will be suntable for training up the rafters. They will require careful attention as to watering to establish them and keep them in good health. It does not matter whether they are on the Manetti or seedling Briar, we have them equally good on both stocks. If the soil is very heavy we prefer the Briar; if light, the Manetti.

CISBUS DESCOLOR NOT COLORING (A Riackmith).—The foliage colours

CISSUS DISCOLOR NOT COLOURING (A Blacksmith).—The foliage colours best when the plant is grown in a rather shaded position. If it is grown in such a position in a warm moist stove, and the roots are kept in an active state, the leaves seldom fall being richly marked. A humid atmosphere is preferable to syringing. Your specimen is perhaps grown in a house that is too cool and dry, or you have permitted the plant to become dry at the roots at some time. Few plants are more easy to cultivate than this, but it never colours well in a dry atmosphere.

CLEMATIS PRINCE OF WALES (I. O. N.).—You may safely plant this variety as you have been advised; it grows as freely and flowers as profusely as C. Jackmani, and is equally rich in colour; it is indeed one of the best varieties for beds and pillars.

ONIONS FOR AUTUMN SOWING (A Youngster).—The white Tripoli is a reliable variety, but if you require a smaller Onion and one which forms its bulbs early sow the Queen. Mr. Allis, whom we know to be a good cultivator and careful observer, states that the old Silver-skinned Onion that is usually grown for pickling is valuable when sown in the autumn. We have not grown it in the manner indicated, but it is worthy of trial. Sow the seed as speedily as possible.

CLAY FOR ROSES (J. B.).—The clay should be chopped up as finely as possible before it is spread on the ground with the manure, as if in large lumps the action of frost would not reduce them to the extent you imagine. It cannot be chopped too small nor mixed with the soil too thoroughly when the ground is dug in the spring. The specimen sent is a peculiar instance of tetratology or the metamorphosis of the floral organs. There appears to have been a partial cessation or check in the growth resulting in the production of perfect sepals and petals, but previous to the development of stamens and pistil a vigorous additional growth was made, the axis being prolonged and bearing ordinary leaves and flower buds. It is occasionally seen, but is by no means common.

CAMELLIAS GROWING TOO VIGOROUSLY (G. S.).—The Camellia having very tender roots is impatient of being disturbed, and should therefore be very carefully treated. Lifting should be done as soon as the growth is completed and the wood a little firm, or it may be deferred until spring just before the plants start into growth. Spring is preferable when the plants are large and require cutting-in so as to preserve their symmetry. The extraordinary growth is probably owing to the season being so moist.

ERUIT TREES FOR SOUTH-WEET ASPECT (Idem).—Peaches and Nectarines would succeed, but the trees would require protection in spring. Hale's Early, Dr. Hogg, Royal George, Noblesse, and Barrington Peaches, with Lord Napier Nectarine, would be suitable; or Plums would answer, as Green Gage, Jefferson, Kirke's, Transparent Gage, and Coe's Golden Drop. The southeast aspect would suit Apricots—Moorpark is the best; or it would suit Plums. Tea Roses would succeed in this aspect, and we prefer them to every other kind of climber for affording cut flowers; the wall would not accommodate more than three Apricot trees, and as many, or at most four Roses—that is, one between each tree and at the ends of the wall.

ROSES IN VINERY (B).—Tea Roses would not succeed in a vinery beneath the Vines, as they require abundance of light. It is immaterial whether a Maréchal Niel Rose trained to the roof of a glass structure be planted inside or outside the house, only in case of the latter the stem must be protected in winter by a hayband or other material.

HEATING VINERIES (W. G. C.).—The brick flue you propose would need stone slabs for the top, and as it ought to be 3 inches wider than you name and a brick higher it would probably prove more costly than you magine. The cheapest flue you can construct would be of strong 10 inch

well-burnt glazed pipes such as are used for draining, but they must be connected with the furnace by a brick flue about 8 feet long, and even then the pipes may crack at some time or other. We have known drain pipes to answer admirably, and we have also seen them crack seriously, causing much inconvenience. For heating vineries such as yours we should have a saddle boiler and two rows of 4-inch pipes. This would be by far the most satisfactory mode, and in the end would not be more costly than the flue. The furnaces you name will be sufficient if you adopt the flue, and you had better consult a practical builder about making provision for cleaning it whether it be formed of bricks or drain pipes.

SEMI-DOUBLE LAPAGEILIA (Subscriber).—We should save seed from the flowers having twelve petals, and should also layer the shoot producing them. It is not certain that you will succeed in raising plants that will produce flowers of the kind you mame, but the experiment is well worth trying. We know that flowers of Stocks and Wallidowers which have more than the ordinary number of petals produce a greater per-centage of doubles than do the normal single flowers of four petals.

PRUNING CHIMBERS (F. Byron).—If the Rose has not covered the space required secure the long shoots to the wall their entire length, but do not crowd them. If the growths are not wanted for covering the wall cut them off now to within about 6 inches of the main stems from which they issue. The Vine and Wistaria may be treated precisely the same. Russian mats or frigi domo placed over the Magnolia will preserve it unless the frost is unusually severe, and in that case the addition of a little dry hay or fern may be advisable.

rrost is unusually severe, and in that case the saddition of a fittle dry lasy of fern may be advisable.

SCENTLESS ROSES (Dublin),—Some of our Rose-growing correspondents have obliged us with the following list of Roses that have little or no perfume; but one of them observes that nearly all Roses have more or less of scent, it being only a question of degree and the sensitiveness of the organ detecting it, with the influence of soil and climate:—Hydrid Perpetuals: Annie Blanchon, Annie Laxton, Antoine Mouton, Auguste Mié, Baronne de Rothschild, Baronne de Maynard, Belle Normandie, Bernard Verlot, Capitaine Christy, Charles Verdier, Clothilde Rolland, Comtesse de Serenye, Coutesse d'Oxford, Duchesse d'Orleans, Edouard Morren, Elie Morel, Emilie Hausburg, Etienne Levet, Hippolyte Jamain, Hortense Mignard, John Hopper, Kieter, Madame Charles Verdier, Madame Hunnebelle, Madame Lacharme, Elies Levet, Madame Nachury, Marie Finger, Madame Prosper I angier, Miss Poole, Madame Vidot, Mdlle. Eugénie Verdier, Marguerite de St. Amand, Marquise de Castellane, Miss Hassard, Monsieur Noman, Mrs. Veitch, Mrs. Baker, Oxonian, Paul Neyron, Princess Beatrice, Princess Mary of Cambridge, Reine du Midi, Reynolds Hole, Souvenir de General Douai, Star of Waitham, Griffiths. Of Bourbon Roses Catherine Guillot, Sir Joseph Paxton, Baronne Gonella, Armosa, Acidalic, and Reine Victoria are devoid of perfume. China Rose: Cramoisie Superieure, Ducher, and Mrs. Bosanquet. Nearly all the Tea and Noisette Roses are strougly scented, but the above list contains a very great variety, and annongst them many of the very best exhibition Roses.

STAMROCK (A Young Gardener).—There is some doubt as to whether the name Shannock was originally applied to the Oxalis Acetosella or the Trifolium repens, but there is more evidence in favour of the latter. Rhubarb is certainly not a fruit, as the edible portion is the succulent petioles of the leaves. It is more properly regarded as a vegetable, and therefore included in the classes for vegetables at exhibitions.

in the classes for vegetables at exhibitions.

NAMES of PLANTS (James Shearer).—1, Apium graveolens (Smallage or Wild Celery); 2, Chærophyllum sylvestre (Cow Parsley); 3, Undeterminable in the absence of seeds and radical leaves, which are always requisite to determine the Umbellifere; 4, Polygonum Persicaria (Spotted Persicaria); 5, Veronica Beccabunga (Brooklime, Speedwell); 6, Narthecium ossifragum (Bog or Lancashire, but it is fast disappearing owing to the rapid cultivation of the bogs, particularly in the lowlands—Chat Moss for instance, while in Clifton Moss it has altogether disappeared. (R. P. O.).—We think it is Tritonia aurea, but the flowers were so withered as to be almost unrecognisable. Flowers should not be posted on Saturdays, as they are almost certain to be withered before they can be examined on Monday. (Rumalho).—The spray arrived in a withered state, and was also crushed in transit. We placed it in water, but instead of recovering its freshness it decayed, and we are unable to identify it. It resembles a Marcgravia. (Sid).—As none of the plants sent were numbered, and not even separated in any way from each other, it is obviously impossible for anyone to give their names so that the name of each species can be recognised by the sender. If good specimens are sent duly numbered we endeavour to give their names; but we do not undertake to name plants without flowers, nor Ferns without spores. (Mrs. H.).—The specimen is the true species (Liriodendron talipifern), and not a variety. (G. Murray).—The succulent plant is Sedum spectabile. The other is the Rose Campon, Lychnis (Agrostemma) coronaria. (W. S.).—1, Specimen too withered; 2, Linana vulgaris. (V. G.).—1, Adiantum Capillus-Veneris; 2, A. assimile; 3, Plymatodes Billardieri; 4, Pteris serrulati; 5, Nephrodium molle; 6, Lastrea tenericaulon. (Consum Reader).—The specimen numbered 22 is Aucuba japonica, but the others were all insufficient for accurate identification; 21 is a variety of the common Ash, probably parvifolia; 23 resembles Spir

THE HOME FARM:

POULTRY, PIGEON, AND BEE CHRONICLE.

THE ADVANTAGES OF DEEP CULTIVATION.

(Continued from page 180.)

Ir by no means follows that in deep cultivation the subsoil should be brought to the surface, but in most cases quite the reverse, because it is well known that all subsoils except peat contain more or less seeds of weeds, which may have lain dormant for generations. More particularly is this the case upon strong clays and light chalk or sandy land, for the former is very apt to crack open in a dry hot summer and leave for a time wide and deep fissures in the land, and it is supposed that the seeds of docks, thistles, and other weeds when dropped have fallen into these openings in the soil, and been there retained until liberated and exposed by deeper cultivation. Again with respect to chalk or sandy soils, certain weeds are indigenous to them, such as charlock, red weed, and wild parsnip; and although weeds may become scarce on the surface soil after a course of careful and good farming, yet as soon as the plough is let down somewhat deeper than usual, a number of these weeds will be sure to appear and cause heavy expenses in hoeing, weeding, &c. There is, however, an admirable implement which has been in use for some years but lately improved, called the "weed eradicator." This is drawn by one horse, and covers a space 9 or 10 feet in width, and pulls the weeds without injury to the corn, and as the machine revolves leaves the weeds behind to die. This is of immense importance where the land is infested with charlock, poppy, &c., especially in a rainy summer such as we have experienced this year. Hand-pulling used to be formerly practised, but labour is now scarce and dear, hence the advantage of machinery.

Having previously stated that the best time for deep ploughing and deep cultivating is in the autumn or early winter, and having also given the reasons for so doing, we would recommend the home farmer not to attempt it at other times of the year, particularly when it is intended as a preparation for cereal crops, because the land would be found too hollow. Our practice tells us that all cereal crops require a firm bed to root in, although it might have been moved deeply with benefit the previous year as a preparation for the root crops. When the quantity of arable land upon the home farm does not exceed from seventy to one hundred acres, the horse power of the farm may be equal to the work of deep tillage by the use of the ordinary plough and the subsoil plough, because it must be remembered if the deep tillage is done only once in four years, and this is certainly frequent enough, it does not require any great additional horse power to effect it. There is, however, upon some soils rocky substances of considerable size that have been found embedded in the soil just beneath the ordinary depth of ploughing, and this is not only a disturbance in the work of ploughing, but it is a source of great difficulty in subsoiling, not only when effected by horse labour, but in doing it by steam power when the rocks are large. Upon this hilly land the surface soil is constantly wearing away, being washed by rains into the valleys, so that when we have been ploughing such land we have been obliged to employ a man to follow the plough with a pickaxe to take up such rocks or boulders as the plough may touch in passing, for they not only impede the proper tillage of the land, but the corn dies-off in patches where the rocks exist in the subsoil. On farms even of one hundred acres or less it will certainly be advisable to employ steam power for deep tillage when it can be had upon hire by paying so much per acre for the work; it then becomes a question of the best way of employing steam power for deepening the tillage, for it will not do to plough the full depth required to be moved and turn the raw subsoil up on the surface. We therefore recommend that the common plough should first turn a furrow about 5 inches in depth before proceeding to use steam power, because the subsoiling coulters of the steam cultivator may then be used at almost any depth with efficiency, and the subsoil may be broken with greater case and facility in consequence of the surface soil having been recently moved. When the home farm consists of several hundreds of acres steam power should always be available for cultivation of all kinds, whether shallow scarifying, ploughing, pressing, or deep cultivation may be required, for on all large farms steam must be considered as the chief motive power for the ordinary work of the farm.

We will now refer to the question of soils, and taking first land resting on chalk. Where the top soil is strong or loamy this may

be cultivated deeply with great advantage. On land where the chalk crops out on the surface we have noticed that great injury has frequently been done either by deep ploughing or cultivating, because these soils where the chalk is nearly always hard and is called rubble, after being deeply moved will not settle down firm again, and for years will remain comparatively sterile. We believe that such soils produce better by using the scarifier only instead of the plough, except when the land is to be ploughed out of lea. Sandy land when it consists also of a sand subsoil, unless it contains large boulders of a sandstone, will not pay for deeper cultivation than usual. The same may be said of the sandy loams except in some instances where the subsoil is strong and retentive, it will then answer for deep tillage by subsoiling. Stonebrash, marl, and limestone soils, including also the greensand formation, the latter being often found at the base of the chalk hills, will all pay for deep tillage, and deep ploughing also, because these soils contain phosphate of lime. In bringing fresh soil to the surface the mineral properties of the land are brought into action by atmospheric influence and liberated for the benefit of crops both of cereals, pulse, roots, &c. Peat, moss, or fen land where the peat lies shallow with a stronger subsoil will often pay for deep tillage; even deep ploughing in such a case will be of advantage, for the more of the stronger subsoil that can be brought to the surface the better, because it will impart substance and solidity to the peat, and enable it to furnish food for plants. Pure peaty land consists merely of decayed vegetable substances, and is so loose and hollow in the natural state as to be almost or quite barren; whereas when ordinary earthy substances are mixed with it, it becomes firm and the vege table humus is constantly decaying and furnishes plant food in abundance.

Although we have introduced to notice some of the different soils to illustrate how they may be affected by deep cultivation the home farmer we consider should always experimentalise upon part of a field first, in order that it may be ascertained before making a heavy outlay what will be the effect of deep tillage. To exhibit the propriety of so doing we have an instance upon our own land, a portion of three fields being of a very productive nature, and never manured for a period of sixty years, but always gave full crops under a judicious rotation of cropping. This land is a strong loam upon clay throughout the fields, but in the most productive part we had the subsoil analysed, and the result proved that it contained a large amount of potash. Now this hand paid well for deep cultivation, because it liberated and brought the potash into action. In the other parts of the fields brought the potash into action. In the other parts of the same, the land both at top and subsoil was to all appearance the same, whereas, it being deficient in potash, the subsoil would pay well for moving by the deep cultivator, but not for ploughing and the property of the same and the same and the same and the same and the same are the same and the same are the same as the same are the same as the same are the same are the same as the same are the same raising the clay to the surface. Deep cultivation as a rule may now be done upon lands of any extent, but the higher price of manual labour, the much higher price of horses, and the increased difficulty of insuring that the horses are well cared for by teamsmen, all point in one direction, and lead to the idea that we must not make a man do what a horse can do, and that a horse should not be made to do what a steam engine can do. There is much to be done in many districts to facilitate culture by steam by the removal of fences, hedgerows, &c., and upon farms of some considerable extent before trying the engines and cultivating tackle a calculation should be made how many horses can be dispensed with. A friend of ours occupying a large hill farm of chalk soil says, "Before I purchased steam tackle I was not master of my work with less than thirty-two cart horses," but now he considered he was in a better position with Fowler's engines, &c., and twenty horses. The use of steam power suggests some very important ideas, for when we consider that in discarding so many horses, and that the value of the food which each horse required would fatten three bullocks in the year, it becomes a question of the highest consequence to the home farmer as well as the public. The animal power is maintained by the consumption of agricultural produce, whereas the power of steam and all its requirements are derived from the elements of earth, fire, and water—that is to say, metal and coals from the mine, and water from the clouds and springs. Thus steam gives us her power without trenching upon the food of man or animals; but for the home farmer to make proper use of steam power in many districts good roads and ponds for retaining water must be available for constant use.

WORK ON THE HOME FARM.

Horse Labour.—As the corn harvest is so late it will not now be advisable to sow turnip seed after the corn is cut if good roots are required; but either turnip seed or rape seed, or both in conjunction, may still be sown if spring food only is required. When the turnips and rape run up with greens they furnish abundance of green fodder either to fold off with sheep or to cut up for soiling dairy cows, young stock, or even fatting bullocks if they have also a good allowance of cracked beans, maize, and cake. The home farmer must now turn his attention to drawing out yard and box manure on to the leas where intended for ploughing and pressing and sowing with wheat; and it must be

remembered in a late season like the present that time may be gained by using steam power for ploughing and pressing lea ground, as this work is now done with neatness and good effect either by hired tackle or the steam power used as the cultivating power of the farm. Sowing trifolium must be done early in a season like the present, and we recommend that 80 bs. of seed per acre may be sown with advantage, in order if possible to save a crop in spite of the slugs, which this year prevail to a most unusual extent. Winter vetches and tye may also be sown as soon as the land can be prepared to receive the seed. The most important matter to be considered now and before wheat-sowing is commenced is that in case the weather should prove dry in September and early part of October the land after corn, &c., should be autumn-cultivated, at least all the land intended for mangolds and Swedes next year. As soon as the land is scarified and the and Swedes next year. As soon as the land is scarified and the couch and weeds carted away the land may be fallow-ploughed a good depth in the early part of the winter after the wheat-sowing is completed. This autumn tillage, according to our practice, we always continue until the rains commence, at which time cleaning the stubbles must cease; but the wheat land will then be in good order for ploughing, pressing and sowing.

In the early districts wheat will now be forward enough for the

reaping machine. Nearly all the corn crops are, however, so much laid by storms that it will be necessary to use the lifting points which project in front of the reaper to lift the corn off the ground so that the reaper may cut the straw which it would in many instances pass over. When the home farmer has not these lifting points attached to the reaper they may be obtained and attached to any reaper; four of them are required, and they cost about 8s. each. It is this year of more importance than usual that the cereal crops should be cut early, as they are so much laid by storms that they will be greatly injured if not out and set up that the cereal crops should be cut early, as they are so much laid by storms that they will be greatly injured if not cut and set up. It is very rare that corn is cut early enough to damage the grain, but on the contrary, for it will endure much bad weather if cut and set up when the straw is dry, and will take less injury in this way than in any other. The reaping machine, with apparatus for tying by wire, is now sufficiently improved and useful for all purposes of cutting and typing corn, except where the wheat or oats are too long in the straw, for in such a case it is apt to hang up in the typing apparatus and impede the work. We hear that there is now to be obtained a one-horse tying machine which follows an ordinary reaper and ties the corn out of swathe, and it is reported that it meets all the objections above named and it is reported that it meets all the objections above named and will tie any kind of corn, and by following the reaper keep pace with it in work. The home farmer must be prepared for the depredations of slugs upon all the late-sown crops, either of trifolium, tares, rye, &c., and many farmers are advised to sow lime in the caustic state to prevent the slugs doing injury to the young plants; but this seldom answers the purpose, as a shower washes away the lime and the plants are as much exposed as ever. A away the lime and the plants are as much exposed as ever. A friend of ours says that he saved his mangolds this year by runthem on the land so many hours during the day, but more particularly in early morning and late in the evening, with a boy to mind them and keep them to their position. This reminds us that we did the same thing in the years 1838, 1834, and 1836, in which seasons the small black palmer worm destroyed the turnips and Swedes throughout many districts in the south-eastern counties. Various expedients were resorted to, such as drawing ropes across the plants to brush off the palmers, but we saw no remedy so good as that which we adopted. We employed all the ducks we had and bought others, keeping and minding them on the turnip land every day, by which means they ate up all the palmers and saved the turnips, which were of course, under such circumstances of more than ordinary value.

Hand Labour.—If the weather should prove fine in the harvest Hand Labour.—If the weather should prove fine in the narvest it will be necessary where labour can be obtained to take into work extra men and keep them hoeing roots, &c., which work has fallen so much into arrear that unless hoed at the critical time the crops will be ruined in growth. Something may, however, be done by horse-hoeing crossways as well as between the rows, for although they cannot be singled in this way it keeps them in a growing state until they can be singled out by women or boys. Another word of caution we must offer to the home farmer—that is, to keep the sheep changed and well fed with cracked beans. is, to keep the sheep changed and well fed with cracked beans, is, to keep the sheep changed and well fed with cracked beans, and lie on dry ground at night time, for we already hear that large numbers of sheep are suffering from rot and coathe in consequence of the succession of heavy rains in various pasture districts. Much hay is still about in the meadows, and much has been flooded and seriously injured, in which case spice may be used to give the hay an aroms. We have named this before and set forth its advantages; but, hay being damaged so much, straw, particularly oat straw, if well harvested will be of sufficient value if spiced when ricked at threshing time to use as a substitute for hav. for hay.

A CAUTION TO APIARIANS.—Messrs. Neighbour have received information that a man calling himself Wyld has paid a visit to Essex, representing himself as being sent by their firm for the purpose of purchasing stocks of bees on their account, and that

after obtaining the bees he has decamped without paying for them or his board and lodging at the hotel. Messrs. Neighbour have no man of this name in their employ, or one that at all answers the description given.

THE SULTAN CLUB.

THIS Club, which has recently been formed, has issued the following rules, which explain its purport and the objects of its promoters :

1, The object of the Sultan Club shall be to provide classes for Sultans at all good shows, and generally to promote the interests of Sultan breeders.

2. The number of members shall be unlimited. The annual subscription shall be one guinea, payable at the beginning of each

year.

8, The Club shall be under the direction and management of a President, Committee of four, and Hon. Secretary and Treasurer. Half of the Committee shall retire annually, but shall be eligible for re-election

4. The election of members is vested in the Committee, and shall be made by ballot, one black ball to exclude.

5. Any member who shall be guilty of trimming or any other dishonourable practice shall be expelled from the Club, and shall be expelled from the Club, and shall

forfeit his subscription and all rights and privileges of membership.

6, In order to encourage the entries in Sultan classes, 10 per cent. of the annual subscriptions shall be devoted to a champion prize, to be awarded annually to the member of the Club who shall have made the largest number of points in the Sultan classes during the year. Points to count as follows:—First prize or cup, 6; second prize, 5; third prize, 4; fourth prize or very highly commended, 3; highly commended, 2; commended, 1. Points made at Birmingham, Oxford, the Crystal Palace, and the Dairy Show to count double Show to count double.

7, Reports of all meetings and proceedings of the Club shall be

sent to the various poultry papers.

8, No alteration shall be made in these rules except with the approval of a majority of the members of the Club. STANDARD FOR JUDGING SULTANS.—A bird perfect in shape, style, colour, &c., to count in points one hundred.

DEFECTS TO BE DEDUCTED.

Points.	Points.
Comb, too large or badly shaped . 5	Tail too small
Crest, too small or loose, and un-	Legs too long
tidy	Faults of colour 15
Want of heard 10	Want of size
Want of backle 7	Want of symmetry 10
Wings tucked up 5	Number of toes not matching in a
Want of leg-feather 10	pen 3

DISQUALIFICATIONS.—Any want of condition; absence of beard-leg-feather, or vulture hocks; plumage any colour but white; legs any colour but white; wry or squirrel tail; any bodily de-

The officers of the Club for the present year are H. B. Dugmore, Esq., President; Messers. C. Atkinson, H. Beldon, H. W. King, and S. H. Shorrock, members of the Committee; the Rev. John H. Shorrock, Derby being the Hon. Secretary Wright, Newborongh Vicarage, Derby, being the Hon. Secretary and Treasurer.

HOMING PIGEONS.

HOMING PIGEONS.

The use made of homing Pigeons during the siege of Paris gave a great stimulus to the training of them as a practical pursuit apart from fancy. We have lately heard of two interesting cases in which they are being made use of. In one of the daily papers we read, "Since the conclusion of the war of 1870-71, in which Pigeons were frequently employed to carry messages when it was impossible to convey information by any other means, the breeding of these birds has been encouraged in every way by the military authorities of Germany, and large Pigeon houses have been established in all the principal fortresses of the empire. The experiments lately made were undertaken in order to ascertain whether the Pigeons after being confined for some time (as they often might be if used to carry messages in time of war) at a point distant from their proper home would still return to it when liberated. Accordingly 149 birds were carried from Aix-la-Chapelle to Metz and imprisoned in the latter fortress. After a month's confinement they were liberated, and by the morning of the folconfinement they were liberated, and by the morning of the following day 184 had returned to their cots in Aix-la-Chapelle, the bird which arrived first having flown from Metz to Aix-la-Chapelle, a distance of 112 miles, in four hours and thirty-eight minutes." We consider this a most interesting experiment. Great pains are now taken to train homers to fly immense distances, but few of their admirers have any idea of the time that they may safely be their admirers have any idea of the time that they may safely be

their admires have any stees of the tine that that they have kept from home without fear of their forgetting it.

The other new experiment has been made by fisherfolk in the north-east of Scotland. "When the herring shoals are far from land and the weather is calm the fish-curer is usually kept in ignorance as to the success or otherwise of his boats until a late hour of the day, and is consequently unable to make adequate preparation for dealing with the fish when they are landed. Profiting by the experience of the Parisians during the siege, an enterprising fish-curer at Wick a year or two ago procured several Carrier Pigeons from Antwerp, and placed one in each of his boats before they took their departure in the morning for the fishing ground. Early next morning the birds arrived at his home bearing messages from the boats, stating the extent of their hands, their whereabouts, and probable time of reaching the harbour. The experiment was so successful that some other fishermen followed the example set them. As a rule fishermen are not hasty in adopting improvements even when the object of them is to provide for their own comfort and conveniences; but it is such an obvious advantage for everybody to have the earliest information as to the result of the night's toil at sea that it is reasonable to hope that in another season or two the employment of Pigeons will have become general."—C.

VARIETIES.

It is with great regret that we have to record the death of Mr. Thomas Norwood, which took place somewhat suddenly at Salisbury on Monday, August 25th. Doubtless many of our readers knew him as an ardent fancier of poultry, especially white-created Polish, which he bred up to a high standard of excellence and showed with almost unvarying success. He was an ornithologist and naturalist of keen observation, and had great powers of generalising from facts which came under his notice. We have often read with much interest his letters on the habits of birds, and we believe that had not his occupation in connection with the South-Western Railway at Salisbury taken up almost all his time his researches as an ornithologist would have been widely known. In his case, as in many, innate genius for one pursuit seemed to make way against all difficulties. When we had the pleasure of paying Mr. Norwood a visit we were charmed with his collection of stuffed birds, all preserved by his own hands, and with his extraordinary knowledge of the works of the great naturalists. He seemed mentally to live among them, and could repeat long passages from Watertou's essays. He was a great lover of flowers too, and in his garden by the railroad side had many choice roses. We are sure that many will join us in lamenting the fate that has cut short so interesting a life.

— WE understand that a testimonial is to be presented to Mr. John Martin, late manager of the Patshull poultry yards, and formerly of those of Lady Holmesdale. The promoter is Mr. Herbert Jenkins of Aberdare.

— DORKING fanciers will be glad to learn that the Dorking classes at the Agricultural Hall Poultry Show will be judged by Mr. T. C. Burnell.

— WE hoped that we had heard the last of the grievances of Rnglish exhibitors at the Paris Exhibition of poultry; it is not so, however. We have lately learnt that to this day the proper prize money has never been remitted to the owner of the famous Dark Brahmas which there took first honours. According to an understanding between the English and French Judges prizes of equal value were awarded to English and French birds. The authorities now try to repudiate this arrangement, and offer the miserable sum of ten francs without a medal for the first prize. One of the Rnglish Jurors has addressed an energetic remonstrance to Senateur Krantz as a last resort before appealing to the highest authority on the British Commission.

— The Lincolnshire Bee-keepers' Association, whose show was announced to be held at Long Sutton in connection with the Long Sutton Agricultural Society on September 17th and 18th, has been postponed to October 8th and 9th in consequence of the lateness of the harvest. The time for entries is extended to September 29th. The Hon. Secretary is Mr. R. R. Godfrey, Grantham.

— THE HARVEST IN ITALY.—A recent telegram from Rome states that the drought and the parching heat of the last two months have proved as disastrous to Italian husbandry as the diluvial rains that preceded them. The accounts that are sent from all parts of the peninsula constitute almost an unchequered tale of woe. Wheat and hay have done well in Latium and Piedmont, but elsewhere both have suffered so much from the inclemency of the weather and from caterpillars, that the returns of wheat are reduced in some places to less than half the usual amount, whilst the supply of hay garnered in will scarcely last through the winter. The same causes have acted deleteriously on maize. If present prognostications be verified, this cereal, the staple article of food of so large a portion of the peasantry, will fail to an extent which is terrible to think of. The rintage presents somewhat more reassuring prospects. The earlier kinds of grapes were destroyed by the rain and hail, but the later kinds bid fair to make up for their deficient quantity by the excellence of their quality.

— A NEW industry is about to be established in the State of Maryland in the shape of beet cultivation, which is proposed by a company of Germans, who have offered to come to Baltimore

and set up a large sugar factory, provided that the farmers will plant 2000 acres at least with German beetroot. They guarantee to take the whole produce at the rate of \$5 per ton. It is considered that good land ought to produce thirty tons of beet per acre; and, as the climate is a suitable one for this crop, it may be reasonably expected that before long a fiourishing sugar industry will be added to those already existing in Maryland.

— FULLY one-half of the beginners in thoroughbred poultry breeding, says the Prairie Farmer, engage in the business because they think it will be an easy way to make money. They think that if celebrated exhibitors can sell eggs and fowls at high prices, why of course anybody can do it if they only have the fowls and eggs to sell. The more they think about it the easier it looks, and they proceed to invest in fowls and eggs, to build houses and yards, and figure up the expected profits, which are seldom if ever realised. This counting chickens before they are hatched is a very easy but an uncertain business, and furnishes the only exception to the rule that "figures don't lie."

THE RESULTS OF BEE-KEEPING IN 1879.

SURELY this year 1879 will be long remembered in the apiarian world as "the black year," for not only has there been no honey harvest at all, but in most parts of England bees have been starving

and are dying off rapidly.

On my return home on the 16th of August atter a month's absence some hives were found absolutely foodless, not a particle of honey being visible in any one cell, nor, I am persuaded, was there a single pound in all the other stocks put together. Breeding had ceased in nearly all, and no pollen appeared to have been stored. It was evident that prompt measures must be taken to save them; accordingly the first dry day we began operations by simultaneously doctoring three bar-framed stocks standing side by side. All the combs with brood found in any of them after sweeping off all the bees were collected together and given to the strongest of the three; the other two hives were joined together under a pure Italian queen bred here this summer; so we made two strong stocks of the three weak ones. In another part of the apiary we joined two other rather weak stocks, giving the brood of one to a third stock with an imported queen. Thus my thirteen hives were reduced to eleven, all which I set to work at once to feed, and they have been fed continuously ever since. Sixty-two pounds of sugar have been taken down during the week past, representing about 90 ibs. of food. The result is highly satisfactory. Poverty has been replaced by weath; the silence of deepondency has given place to the cheerful hum of prosperity; heading in all hives is going on to indee by the daily increasing

tory. Poverty has been replaced by wealth; the silence of despondency has given place to the cheerful hum of prosperity; breeding in all hives is going on, to judge by the daily increasing quantity of pollen that is being carried into all the hives; and in the swarms which had hardly any combs building has been going on without intermission. I shall give my bees about a hundredweight of sugar in addition to what they have already absorbed in the course of the next fortnight, during which time I hope the increase of the population will be large. My apiary will then be allowed to shift for itself till towards the middle of October, when if necessary another feeding will take place to put them in a condition to face the winter.

I earnestly recommend all bee-keepers to lose no time in doing as I have done if they desire to continue their apiaries. The expense, of course, is something, but nothing to the value of these stocks. I reckon that they will cost me in sugar at 3d, per 10, on an average from 4s. to 4s. 6d, a piece. Crushed loaf is what we are chiefly using. I am content if each hive takes down 2 lbs. of syrup per diem. Every sort of bottle feeder is in requisition, such as water caraffes, old medicine and pyretic saline bottles, besides Neighbours' feeders, &c. Flower pots inverted are capital covers for the bottles in the open air, keeping out robber bees very effectually.

I may mention that I have been pleased to find all my young queens turn out successful breeders: not one has failed. At one time I expected that few of them would have mated properly owing to the extreme uncertainty of the weather all through June and July.—B. & W.

HIVING CONDEMNED BEES-SURPLUS QUEENS.

SEVERAL readers besides a correspondent, "H. A. S., Surrey," doubtless desire information on this subject. In making stocks by driving from condemned hives it is desirable at this season to have not less than 5 or 6 bs. of bees, and three or four lots will have generally to be put together to effect this object. If these are constantly fed, a guide only being given to them, they will build splendid combs and raise abundance of brood for passing in fine condition into winter. In order to place them in a frame hive they should be driven all into one skep, or if their number he so great as to make this inconvenient, into two skeps. The frame hive, having its bottom board removed, is placed upon a sheet and propped up by a piece of wood or couple of stones, so that the bees have ample room for entering, and then the lots are thrown down together against the hive door. They will not be

long in passing in and clustering in the frames, when the hive may be lifted on to its bottom board, placed on its stand, and feeding at once commenced; but great care must be taken to prevent stranger bees taking the sweets, or robbing is almost certain to follow. Surplus queens with condemned bees may be utilised if queenless stocks intended to winter are known to exist, but those with little experience will be wiser in allowing the bees to settle the question of which queen shall be mother, or mother-inlaw, to the whole community.-F. CHESHIRE.

EXAMINING HIVES.

THOROUGH, not superficial, examinations of hives should be made twice or thrice a year in all apiaries. Many bee-masters do not limit their internal examinations. They know that when a hive is not doing well there is something wrong, and they try to find out the real cause. In almost all apiaries it often happens that a hive not considered the best there commences early in the season a career of prosperity and runs well ahead of all the rest increases its distance in front till the end of the season.

During the spring and summer months we examine the in-ternal operations of hives frequently. Such examinations in times of prosperity afford us much pleasure. It is a satisfaction to a real apiarian to turn up a hive and see the great progress his bees have made in comb-building, brood-rearing, and honey-storing since he last examined the hive. If one or more hives are not prospering an examination may discover the cause. Some queens are too old and in their dotage, some young ones are drone-breeders and useless; some hives are covered internally with damp, which moulds and rots the combs; often combs are overloaded with pollen; some hives are quietly entered by robbers, which carry off every particle of food; and too often hives are spoiled by foul brood, which is a malignant disease. Hives suspected of foul brood should be carefully examined at the end of the breeding season, in other words, when cells are empty of healthy brood. season, in other words, when cells are empty of healthy brood. This happens three weeks after first swarming, and also in the month of September when breeding generally ends. Foul brood is dead brood, and is of course incurable. It bears this name because dead brood, dead maggots, like other dead animals emit a very offensive smell. Cells containing foul brood have lids on them, and are what is technically termed "sealed up," and such cells sealed up are easily discovered when there is no healthy brood in hives. Men of experience can detect by eight foul brood amongst healthy brood, and moreover can smell it where it exists by placing their noses at the doors of hives. Bar-frame hives facilitate the examination of combs for foul brood. Knowing well the evils of this terrible scourge, I advise all to follow the practice of removing bees from hives in which it is discovered.

In the month of May this year I saw that the hive I considered
